National Center for Education Statistics<br>Pascal D. Forgione, Jr.<br>Commissioner

The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to:

## Acknowledgments

This report was produced under the direction of the Education Surveys Program of the Surveys and C ooperative Systems G roup of the N ational Center for Education Statistics (NCES). Sharon Bobbitt was the Project Officer, and Daniel K asprzyk was the Program Director. M ary Rollefson also assisted in reviewing the publication and ensuring its completeness and accuracy.

Thanks are due to a number of staff at the A merican Institutes for Research who helped with this report. M elissa Panagides-Busch and C huck Keil did a large portion of the programming, which was much appreciated. Shannon Daugherty thoroughly edited this publication for consistency and clarity and formatted it for appearance. M ei H an al so edited the manuscript and provided many helpful comments. G abriele Phillips and Linda Tutuh helped create the tables and verify the accuracy of the data. Finally, Don M cLaughlin directed the overall contract of which this report was one part and provided helpful insights and suggestions.

Thanks are also due to several members of NCES, particularly to M arilyn M cM illen of the Surveys and Cooperative Systems G roup and Sue A hmed of the Statistical Standards and Services Division. Summer D. W hitener in the Surveys and C ooperative Systems G roup also deserves special recognition for her assistance in coordinating and organizing the release and distribution of this report. Claire Geddes reviewed the publication and provided hel pful comments. Other reviewers included A Ian G insburg of the O ffice of the U ndersecretary and Eileen Sclan of Long Island U niversity.

## Highlights

- Given the hetereogeneity of schools in the U nited States, remarkably few differences were found in the percentage of school time first through fourth grade teachers devoted to the core academic subjects among various community, school, teacher, and student characteristics.
- A lthough the amount of time teachers spent in school with students each week increased slightly between 1987-88 and 1993-94, the largest increase in time was found in the amount of time teachers spent on out-of-classroom activities, such as coaching, tutoring, grading, preparing lesson plans, meeting with parents, and attending staff meetings. In 1987-88, teachers spent, on average, about 1 hour and 45 minutes per day on these activities; by 1993-94, this time had increased to 2 hours and 18 minutes per day.
- Public school teachers of grades 1-4 spent approximately 68 percent of their school time, or almost 22 hours per week, on core curriculum; private school elementary teachers spent about 58 percent of school time, or almost 19 hours per week, on core academic subjects. A bout half of this time was spent on English/reading/language arts in both sectors.
- Teachers in public schools spent a larger percentage of school time teaching the core subjects to students in grades 1-4 than did teachers in private schools. This finding held true even across the various private school affiliations.
- A lthough new standards of excellence were implemented in the late 1980s and early 1990s, the percentage of school time spent on core curriculum in grades 1-4 remained relatively unchanged from 1987-88 to 1993-94.
- Teachers in most states spent about the same percentage of school time on core curriculum. In 1993-94, only D elaware and the District of C olumbia differed from the national average. However, the average school week in Delaware and the District of C olumbia is slightly longer than the national average, and when the raw number of hours spent on core curriculum were examined, neither Delaware nor the District of C olumbia differed from the nation as a whole.

## Introduction

The proportion of time that elementary school teachers use to teach the core academic subjects- English/reading/language arts, mathematics, social studies, and science- is an important aspect of instruction. These subjects are at the heart of the school curriculum, and the proportion of time spent during the school day teaching them to young students reflects the emphasis schools place on academic topics. Recent concerns about the qual ity of A merican schools have brought national attention to how teachers spend the time they have in an average school day. M any have suspected that the addition of a variety of activities at school has changed teachers' roles, and, as a result, time spent on basic core academic subjects may have dropped. M oreover, as a result of the concern that secondary school curricula "have been homogenized, diluted, and diffused to the point that they no longer have a central purpose," an image has emerged that the best schools in the nation are the ones that spend the most time teaching the basics (N ational C ommission on Excellence in Education 1983, p. 18). If teachers could spend more time teaching these core subjects, many believe the country's education system could provide students with a better opportunity to learn the skills necessary to compete in the international business market.

The publication of $\mathrm{A} N$ ation at Risk in 1983 with its recommendation for more emphasis on the four core subjects- English/reading/language arts, mathematics, social studies, and science- focused national attention on strengthening the core academic curriculum of schools ( N ational Commission on Excellence in Education 1983). A s a result, organizations such as the $N$ ational C ouncil of Teachers of $M$ athematics (NCTM) and the $N$ ational $A$ cademy of Sciences (NAS), to name a few, developed national standards for their subject areas and are working to have these standards implemented as a part of every school's curriculum.

C orrespondingly, many current policy changes aim to increase school time spent on the four core academic subjects, some of which adjust the structure of the curriculum. For example, many high schools that before had either no graduation requirements or had more liberal policies now have adopted a more intensive core curriculum of 4 years of English; 3 years each of mathematics, social studies, and science; 2 years of a foreign language; and $1 / 2$ year of computer science (Education Commission of the States 1993). A lthough some of the overall curriculum requirements have focused primarily on the secondary level, various councils and centers have created standards for elementary schooling as well. The organizations developing the individual course standards have divided students into three groups: Kindergarten through 4th grade, 5th through 8th grade, and 9th through 12th grade. This division, along with the standards themselves, corresponds to one of the $N$ ational Education G oal sestablished by President Bush and the nation's $G$ overnors during a 1989 summit meeting, which calls for A merican students to "leave grades 4, 8, and 12 having demonstrated competency in challenging subject matter, including English, mathematics, science, history, and geography" ( N ational Education G oals Panel 1995).

Several studies have shown that instruction in the core curriculum at the earliest level is important, as exposure to subjects at the elementary level is related to the courses students take
at the secondary level. The more content they are taught early on, the more they learn and the better they perform on later achievement tests (M edrich and Griffith 1992). In general, these goals espouse this philosophy and emphasize early exposure to each of the core subjects, engaging the students' imagination and capturing their interest, thus promoting continued study in these subjects.

Spending a large proportion of school time teaching core curriculum may be important not only in terms of school quality, but al so in terms of teacher satisfaction. The research on teacher satisfaction indicates that the proportion of time spent on instruction is important to teachers. For example, an N CES report on the condition of teaching found that, on average, teachers are required to spend approximately 35 hours a week performing their regular duties at school (C hoy et al. 1993). In addition, they may spend extra time coaching, supervising extracurricular activities, tutoring, grading papers, or writing lesson plans, raising the average total hours in a work week to 46 . Teachers who feel that they spend more time with bureaucratic duties, disciplinary actions, and other nonteaching assignments tend to be less satisfied with their jobs than those who feel they spend more time in actual instruction and interaction with students (Choy et al. 1993). M oreover, job dissatisfaction can lead to a higher turnover rate in the teacher workforce, which in turn might have implications for teaching effectiveness and student outcomes (Bobbitt et al. 1994).

This report addresses these issues by comparing the amount of time spent teaching the four basic subjects to the amount of time students spend in elementary school each week. It compares various school and student variables such as control of school, urbanicity, school size, percentage of students who are minority, and percentage of students eligible for free or reduced-price lunches, as well as certain classroom and teacher variables. Data related to school time are available from the Schools and Staffing Survey (SA SS), conducted by the N ational Center for Education Statistics (NCES). By comparing data from school years 1987-88 to 1990-91 to 1993-94, this report discerns whether changes have occurred in the proportion of school time spent teaching the core curriculum over this time period.

Teacher time spent on core academic subjects might vary among teachers and schools for several reasons. For example, the percentage of school time spent on instruction might vary by the resources available to an institution, by the experience levels of the teachers, or by student characteristics. If a school serves a largely poor or non-English-speaking population, for example, it may spend additional time on students' special needs and may also have fewer resources to devote to learning; thus, such a school may spend a smaller percentage of time on the core academic curriculum. A nother reason for the variation in teaching time concerns the highly localized control over schooling in the U nited States as compared to other countries (Stevenson and Baker 1989). With different communities controlling various factors of the schools across the country, one might not expect to see much consistency between schools. These differences would, however, appear in comparisons across various communities. 0 ffsetting this variation is the fact that schedules could be so tightly packed with enrichment courses (e.g., music, art, and physical education) and additional activities (e.g., homeroom, lunch, and recess) that there is very little room for variation regardless of the circumstances or policies. In addition to the possible variation in school time by certain community, school, and student characteristics, variation over time may also be expected. For example, because of the current education reform climate, teachers might have spent more time on core curriculum during the 1993-94 school year than during the 1987-88 school year.

This report describes the number of hours and the percentage of school time spent on core academic subjects during the el ementary school week around the country. It addresses three central issues about using class time to teach core academic subjects. The first issue is the actual number of hours and the percentage of school time the nation's elementary school teachers spend on instruction in the core subject areas of English/reading/language arts, mathematics, social studies, and science. The second issue involves an analysis of how this time varies by characteristics of the local community, school, teacher, classroom, and students. Finally, trends over time are examined to see how the amount and percentage of time spent on the four core subjects has changed from 1987-88 to 1993-94.

## D ata

This report analyzes the N C ES Schools and Staffing Survey (SA SS), a large and comprehensive dataset on elementary and secondary schools in both the public and private sectors in the U nited States. SA SS has collected data over three different school years: 1987-88, 1990-91, and 1993-94. W ith each iteration, it has surveyed elementary school teachers about the time they devote to teaching core academic subjects.

SA SS uses a complex and random sample of schools stratified by state, sector, and school level that provides representative estimates of (1) the nation and each affiliation for private schools and (2) the nation and each state for public schools. SA SS includes separate questionnaires for private and public schools, school districts (public only), school administrators, and teachers. A bout four teachers were sampled from each school, although this number varied depending on the school size and sector (public or private).

This report focuses on first through fourth (1-4) grade elementary school teachers because they are most likely to teach multiple subject areas to one intact class of students. ${ }^{1}$ In addition, the analysis was restricted to full-time, self-contained regular classroom teachers (i.e., those who taught multiple subjects to the same class of students all or most of the day). Focusing on classes taught by only one teacher allows us to determine how teachers divide up their teaching time and thus to determine the relative importance elementary school teachers place on the core academic subjects. By doing this, the analysis omits (1) grade 1-4 teachers who team teach or (2) classrooms where a different teacher teaches each of the various subjects.

[^0]Teachers were asked to report the number of hours spent teaching each of the four core curriculum subjects in their most recent full week of teaching. Teachers were instructed to round their estimates to the nearest whole hour. A small number of teachers were removed from the sample because the number of hours reported for teaching core curriculum was either 0 or was disproportionately high. ${ }^{2}$

The calculations of the percentage of school time spent on core curriculum were done as follows. First, the number of hours spent teaching each of the four core academic subjects per week was summed to cal culate the total number of hours spent teaching all four core academic subjects per week. Second, the length of the school day was used to determine how many hours per week could be spent teaching the core curriculum. Third, the proportion of this school time spent teaching the core academic curriculum was cal culated as a percentage of the school week and was compared across community, school, teacher, classroom, and student characteristics. In other words, this report examines the amount of school time spent per week on the core academic subjects as a percentage of the time available to teach these subjects. In addition to calculating the percentage of school time spent on core curriculum, all analyses in this report have been conducted in terms of raw number of hours spent on core academic subjects. Discrepancies between the two types of calculations are noted in the text. In addition, the number of hours a teacher spent outside of the normal school day (i.e., outside of the classroom) doing school-related activities each week were calculated.

Because estimates presented in this report are based on samples, they are subject to sampling errors. Standard errors, indicating the accuracy of the estimates, were calculated with appropriate adjustments made for the complex sample design and multiple comparisons. These standard errors are included in appendix B. A ll comparisons discussed in the report are tested for statistical significance at the $\propto=.05$ level.

[^1]
## Results

Because the amount of time spent on core curriculum depends on the total amount of time spent in school, the first part of this section examines the number of hours in a school week. This brief description of the length of the school week and changes in its length and structure over the past 6 years gives a context for interpreting the percentage of school time spent on English/reading/language arts, mathematics, science, and social studies. From there, the section focuses on the percentage of school time spent on core curriculum and the variation over time and across different student, classroom, school, and community characteristics.

W hat is the length of the school week in elementary schools, and has it changed over time?
In 1993-94, teachers in grades 1-4 spent an average of about 32 hours with students in school per week (table 1), which corresponds to 6 hours and 24 minutes per day (assuming students are in school for 5 days of equal length each week). ${ }^{3}$ A lthough this time increased incrementally from 1987-88 to 1990-91 to 1993-94, the average overall increase over the 6 years was calculated to be approximately 25 minutes a week for public schools and 50 minutes a week for private schools. ${ }^{4}$

Teachers, however, spent an additional 9 to 12 hours per week on out-of-classroom activities in addition to their regular classroom time with students (table 1). These activities are outside the normal real $m$ of classroom instruction, and include tasks such as mentoring, coaching, tutoring, meeting with parents, preparing lesson plans, and grading homework. The time spent on out-of-classroom activities increased substantially over the 6 -year period in both public and private schools, increasing from about 9 hours per week ( 1.8 hours a day) in 1987-88 to approximately 10 hours per week ( 2 hours a day) in 1990-91 to at least 11.6 hours per week (almost 2.5 hours a day) in 1993-94. Thus, a typical work week for teachers increased from about 40 hours a week in 1987-88 to about 44 hours in 1993-94, although most of this increase was due to time spent outside of the classroom.

H ow much school time do elementary teachers spend teaching core curriculum, and has it changed over time?

A s noted above, the amount of school time that teachers spend teaching the core academic subjects can be calculated two different ways: (1) as the percentage of school time (i.e., the time available in the school week in which to teach core subjects) that teachers devote to the core academic subjects, and (2) as the raw number of hours that teachers spend on core curriculum. This report primarily examines the percentage of school time spent on core curriculum. The data for raw hours per week spent on core curriculum can be found in tables A .4-A . 8 in appendix A. A ny discrepancies between the two types of analyses are noted in the text.

The 1993-94 SA SS data show that public school teachers of grades 1-4 spent, on average, about 22 hours per week, or just over 4 hours per day, on core academic curriculum; private school teachers spent almost 19 hours per week, or just under 4 hours per day, on all core subjects (table 1). In other words, teachers spent about two-thirds of their time in the classroom on the core academic subjects (table 2). Of the time spent on core curriculum, public school teachers devoted almost 50 percent ( 2 hours per day) to English/reading/ language arts, 24 percent ( 1 hour per day) to mathematics, and about 13 percent ( 35 minutes per day) each to social studies and science. A lthough the proportions of time spent on core curriculum were similar in private schools, the average time spent was slightly lower: 1 hour and 52 minutes a day in English/reading/language arts, 55 minutes in mathematics, 31 minutes in social studies, and 28 minutes in science (figure 1).

Table 2- Percentage of school time spent per week on core curriculum by 1st-4th grade teachers, by sector, year, and subject

SOU RCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1987-88, 1990-91, and 1993-94.

Figure 1- Percentage distribution of school time spent by 1st-4th grade teachers among each of the core subjects, by sector and year

NOTE: For numbers accompanying figure 1 , see table A. 1 in appendix A.
SOU RCE: U.S. Department of Education, N ational C enter for Education Statistics, Schools and Staffing Survey, 1987-88, 1990-91, and 1993-94.

A lthough the absolute numbers of hours spent on core curriculum were lower in private schools, proportionally, all schools distributed their teaching time the same way across the four subjects for all three years (figure 1). O verall, about twice as much time was spent on English/reading/language arts as on arithmetic and mathematics, and almost twice as much time was spent on arithmetic and mathematics as on social studies/history or science. A nd, once again, the percentage distribution of time spent on each of the four core subjects varied little over the period or between the public and private sectors. It is important to note that the slight increase from 1987-88 to 1993-94 in the total time spent on core curriculum in public schools does not reflect a substantial change in school time.

A nother way to examine this issue is to take into consideration the effect of schools having different school-week lengths. Even when the length of the school week is taken into consideration, however, the trends in the percentage of time spent on core curriculum remain the same (table 2). In other words, there was virtually no change in the proportion of classroom time spent teaching core curriculum from 1987-88 to 1990-91 to 1993-94. English/reading/language arts was the subject that public and private school teachers spent proportionally the most time teaching. In addition, public school teachers spent proportionally more time on core curriculum than did private school teachers.

D oes the percentage of school time spent teaching core curriculum vary across different types of communities, schools, teachers, students, and classrooms?

In general, the answer is remarkably little. For example, there were only minute differences in the percentage of time spent on core curriculum in different geographic regions and in different types of communities (table 3). For example, in 1994, public schools in the $N$ ortheast spent a greater percentage of time on core curriculum than public schools in the M idwest. Furthermore, when the raw number of hours per week spent on core curriculum are analyzed, the 1993-94 data show that public school teachers in the South spent about 1 hour per week more than teachers in the W est (table A.4, appendix A ). There were no real changes over time. A school's environment and characteristics of its students, such as size of school, minority enrollment, percentage of students receiving free or reduced-price lunches, and percentage of students who are limited English proficient (LEP), had no relation to the percentage of school time spent on core curriculum. Public elementary school teachers taught core subjects around 68 percent of their total classroom time- private elementary school teachers, about 58 percent of classroom time- regardless of the school's community, size, and type of students enrolled (table 3). This consistency is notable across unstandardized, locally controlled schools operating in the U nited States.

One might assume that even though basic characteristics of schools are not associated with the percentage of time spent teaching the core academic subjects, perhaps specific characteristics of classrooms and teachers are related. But not so. Similar to school and community characteristics, classroom characteristics and teacher experience were generally not associated with the percentage of time devoted to core curriculum (table 4). Where statistically significant differences exist, most are substantively trivial. O ne example of a difference occurs with teaching experience; in 1993-94, public school teachers who had 3 or fewer years of teaching experience spent a smaller percentage of time on the core curriculum than those who had 10 or more years of teaching experience, corresponding to approximately 12-15 minutes per day less.

Two particular areas do show some interesting differences: class size and grade level. In 1993-94, a greater percentage of school time was spent on core curriculum in public school classes with 19 or more students than in those with 10 or fewer students (table 4) - a difference that amounts to about 2.8 hours a week, or just over 30 minutes a day. H owever, classes with fewer than 10 students could be geared toward students with special needs, such as students with limited English proficiency; in this case, it would not be surprising to find that classes of this size spend a smaller percentage of time on core curriculum than a more standard-sized classroom.

D oes the percentage of school time spent teaching core curriculum vary across grade levels?
Teachers of grades 1-4 were similar in the percentage of school time they spent teaching the core academic subjects; however, as students progressed from first through fourth grades, a decreasing percentage of time was spent on English/reading/language arts, while an increasing percentage of time was spent on social studies and science (table 5). In 1993-94, for example, the percentage of time spent on English/reading/language arts in public schools was about 38 percent in first grade, compared to 30 percent in fourth grade; in private schools, the respective percentages were 33 percent and 26 percent. H owever, when examined in terms of raw number of hours spent on core curriculum, no significant differences were found in the amount of time spent on English/reading/language arts across the grade levels in private schools (table A . 6 , appendix A).

NOTE: Individual subjects are averaged separately from all core curriculum.
SOU RCE: U.S. Department of Education, N ational C enter for Education Statistics, Schools and Staffing Survey, 1987-88, 1990-91, and 1993-94.

In 1993-94, teachers spent similar percentages of time teaching mathematics across all four grade levels- about 16 percent of classroom time in public schools and about 14 percent in private schools (table 5). In both public and private schools, fourth grade teachers spent a slightly larger percentage of time on social studies than did teachers of first through third grades. ${ }^{5}$ Fourth grade teachers also spent slightly more time on science than first through third grade teachers in both public and private schools. ${ }^{6}$

Do public and private schools differ in the percentage of school time spent teaching core curriculum?
One school characteristic is associated with differences in the percentage of school time spent on core subjects: school sector. In 1993-94, public school teachers spent a larger percentage of time teaching core academic curriculum than did private school teachers- 68.2 percent versus 58.2 percent, respectively (figure 2). Furthermore, there were some differences within private school types (figure 3). ${ }^{7}$ C omparing the three main categories of private schools- C atholic, other religious, and nonsectarian - with other types of private schools shows that C atholic schools spent a greater percentage of time teaching core curriculum than did other religious schools in 1993-94. In addition, no significant differences were found between nonsectarian private schools and either of the two types of religious private schools. Furthermore, there were no differences between the subgroups within each of the three main types of private schools. In other words, whereas both types of C atholic schools differed from all three types of other religious schools in 1993-94, diocesan and parochial schools did not differ from each other; similarly, conservative Christian, affiliated, and unaffiliated schools did not differ from each other.

The difference between the percentage of school time devoted to core curriculum in C atholic and other religious private schools was rather large. In 1993-94, teachers in C atholic schools spent about 61 percent of their school time on the core subjects, while teachers in other religious schools spent about 55 percent of school time on core curriculum (figure 3). H owever, in terms of raw number of hours, teachers in C atholic schools spent only 1.3 hours per week more than teachers in other religious schools-a difference that is not statistically significant (table A.7, appendix A). A lthough the data in table A . 2 of appendix A show some apparent fluctuations among the years, there were no significant changes in the percentage of time spent on core curriculum across private schools from 1987-88 through 1993-94; thus, only the most recent data (1993-94) are shown in figure 3.

[^3]Figure 2- Percentage of school time spent per week on core curriculum by 1st-4th grade teachers, by sector and subject: 1993-94 (graphed from results in table 2)

SOU RCE: U.S. Department of Education, N ational C enter for Education Statistics, Schools and Staffing Survey, 1987-88, 1990-91, and 1993-94.

Even though SA SS data cannot address why private school teachers spend a smaller percentage of time on core subjects than public school teachers, several explanations may account for these differences. First, public schools are usually more highly regulated in terms of what must be taught in any given school year, while private schools often have more flexibility in designing their academic programs. Second, C atholic and other religious-oriented schools spend a portion of each school day teaching religion, leaving less time to teach the traditional core academic subjects. A lthough this explanation does not apply to nonsectarian schools, it may explain the differences between the religious schools and public schools. Finally, private schools may provide more time than public schools for enrichment activities, such as art or music. Specifically, nonsectarian special emphasis schools may stress one or more of the arts, and special education schools may spend additional time addressing students' specific needs.

Figure 3- Percentage of school time spent per week on core curriculum by 1st-4th grade teachers, by sector and type of private school: 1993-94*

* C atholic private order schools were omitted from this analysis since they are predominately at the secondary level and there were too few cases to analyze.
NOTE: For numbers accompanying figure 3 as well as data for earlier years, see table A. 2 in appendix A . SOU RCE: U.S. Department of Education, N ational Center for Education Statistics, Schools and Staffing Survey, 1987-88, 1990-91, and 1993-94.

D oes the percentage of school time spent teaching core curriculum vary among the states?
Public schools spent, on average, between 60 and 72 percent of school time on core curriculum in 1993-94 (figure 4). This proportion translates into a range of 19.8 to 24.9 hours per week (table A .8, appendix A ). Even though curricular policy is the domain of state and local education agencies, there were fewer differences across the states than might be expected. The average percentage of time spent on core academic subjects in the majority of the states was close to the national average ( 68 percent) (see table A. 3 in appendix A for the percentages for all states). Public schoolsin the District of C olumbia and Delaware spent a smaller percentage of the school week on core subjects ( 60 percent) than did the nation as a whole.

A nother way to examine this issue is to look at the numerator and denominator of this percentage separately- that is, the total number of hours spent on core curriculum each week and the total number of hours in the school week, both of which vary by state and can differ from the percentage ranking. Table A. 8 in appendix A shows the rank ordering of states on hours spent on core subjects, along with each state's average school-week length. This table shows that the average school week in Delaware and the District of C olumbia is slightly longer than the national average. Furthermore, when hours spent on core curriculum are examined, neither Delaware nor the District of C olumbia differ from the nation as a whole. Only M ississippi stands out as the state that differed from the national average; teachers in this state reported spending more time ( 25 hours) on core curriculum than the national average (22 hours).

These findings highlight the need to incorporate the hours in a school week into any discussion of a state difference in time spent on core curriculum, since the length of the school week is often mandated by the state. In 1993-94, the number of hours in a school week varied from just under 30 hours in $N$ ew Jersey to over 35 hours in Texas. In some states, this extra time is used to spend more time on core curriculum; in others, it is used to spend more time on other academic subjects or on enrichment activities.

Figure 4- Mean percentage of school time spent per week on core curriculum by public 1st4th grade teachers, by state: 1993-94

NOTE: For numbers accompanying figure 4 as well as data for earlier years, see table A. 3 in appendix A. SOU RCE: U.S. Department of Education, N ational C enter for Education Statistics, Schools and Staffing Survey, 1987-88, 1990-91, and 1993-94.

## Conclusion

In the current education reform climate, teachers might be expected to report spending more time on core curriculum during the 1993-94 school year than during the 1987-88 school year. On the other hand, because of the concern that teachers are being required to spend more and more time on duties that are unrelated to instruction in the four core academic subjects, teachers might be expected to spend less time on core curriculum during the 1993-94 school year than during the 1987-88 school year. The SA SS data for these years do not support either expectation. In 1993-94, approximately two-thirds of school time was spent on core curriculum in the nation's elementary schools-a finding that did not change from the previous 6 years.

Some have speculated that the percentage of school time spent on instruction might differ by various community, school, classroom, and student characteristics. O ne example, noted in the introduction to this report, concerned the possibility that a school serving a largely poor or non-English-speaking population may spend additional time on students' special needs and may have fewer resources to devote to learning, thus spending a smaller proportion of time on the core academic curriculum. H owever, SA SS data show that the percentage of time spent on core curriculum generally does not vary as a result of student, classroom, teacher, school, or community characteristics. Teachers who work with predominately poor or non-Englishspeaking populations spend the same amount of time teaching the core academic subjects as do teachers who work with more advantaged students. Further, the percentage of school time spent on core academic subjects does not vary between most states.

In 1993-94, teachers in public schools across the country spent an average of 68 percent of school time, or almost 22 hours per week, teaching the core academic curriculum, while teachers in private schools spent an average of 58 percent of school time, or almost 19 hours per week, on core curriculum. This is the most notable difference found across all school, community, and classroom characteristics analyzed in this report. In addition, except for a few isolated cases, very few changes in the percentage of school time spent on core curriculum were found between 1987-88 and 1993-94.

These findings may not be expected; however, there may be little room for variation in a finite period of time during which core curriculum must be taught; enrichment activities, such as art and music, must be offered; lunch must be served; recess is usually provided; and administrative activities, such as roll call and announcements, must be made. For example, if a typical day at a public school lasts 6 hours, and 1 hour is spent on lunch and recess, 45 minutes are spent on an enrichment class or physical education, and 15 minutes are spent on administrative duties, only 4 hours are left to teach core academic curriculum. Four hours a day result in 20 hours per week, almost 2 hours less than the average public school reports spending on core curriculum. C ommunity, school, and classroom characteristics can have little effect on a tightly regulated environment. A nd although reform movements may call for an increased amount of time to be spent on the core academic subjects, few changes can be implemented if an increased
amount of time is not provided, either by lengthening the amount of time spent in school or by eliminating other requirements.

The finding that teachers spent more time on out-of-classroom activities during the 1993-94 school year than during the 1987-88 and 1990-91 school years may al so explain how teachers are balancing the pressures of being asked to take on additional responsibilities and participate in more activities with the pressures of maintaining the goal of focusing the students' learning time on the four core academic subjects. Classroom time remained unchanged, but teachers worked longer days in order to meet expanding school activities in 1993-94 than they did in 1987-88 and 1990-91.

This report found very few differences in the percentage of time spent on the core academic subjects. Two are notable. First, even when private schools were examined by affiliation, it was found that public schools spent approximately 2-4 hours more on the core subjects per week than did any of the private school types. A lthough it might be argued that private schools teach a larger variety of subjects, they do not spend as much time on the basic subjects as the public schools. This does not necessarily mean that students in private schools learn less material than students in public schools, however. Teachers in private schools could be using their time more effectively, or students in private schools may be better prepared in the basic skills at an early age. W hatever the reason, the difference is notable. Second, among the 50 states and the District of C olumbia, the average percentage of school time spent on core curriculum in Delaware and the District of Columbia was smaller than the national average in 1993-94. H owever, when the raw number of hours spent on core curriculum were examined, Delaware and the District of C olumbia were not significantly different from the national average. In this case, only M issi ssippi stood out as spending a greater number of hours than the national average. The differences between both the public and private sectors and among the states may be explained by different curricula that have a variety of subjects competing for time allocation; however, there is no obvious explanation for these findings based on the anal yses done in this report.

Future research should further understanding of how the time that is not spent on core curriculum is allocated. A re students participating in other enrichment activities such as music and art, or are teachers being burdened by too many bureaucratic duties and thus cannot devote more time to the academic curriculum? A Iso, are teachers integrating the subjects in their classrooms, adopting an interdisciplinary approach to teaching? This teaching method would make it difficult to measure the exact amount of time teachers are spending on each of the four core subjects. In addition to understanding how much time is spent on the core curriculum, it is also important to determine the quality of the time. W hat teaching methods are teachers employing to teach each of the four academic subjects? Even though the time spent on the core subjects has remained unchanged over time, teachers may have changed the presentation of the curriculum. M oreover, if the length of the school day or school year was increased, how would the extra time be spent? Finally, why are teachers spending more time on school activities outside of the classroom? A re they receiving expanded opportunities for professional growth, or are the number of burdensome bureaucratic tasks increasing?

U nderstanding time and other restrictions placed on schools helps to provide an explanation of why few changes in the amount of time spent teaching any one subject may occur in schools, regardless of policy changes. A broader understanding of what changes must accompany policy reforms requiring additional time to be spent on core curriculum is necessary if the goal of increasing the amount of time spent on English, mathematics, social studies, and science is to be accomplished.

## A ppendix C

## Technical Notes

## I. Survey C ontent

The Schools and Staffing Survey (SA SS) consists of four main component surveys administered to districts, schools, principals, and teachers. These surveys are the Teacher Demand and Shortage Survey, the School Principal Survey, the School Survey, and the Teacher Survey.

- The Teacher Demand and Shortage questionnaire has two sections: (1) enrollment and teaching positions and (2) district policies. The first section, on enrollment and teaching positions, obtains information on the number of students, the number of teachers and librarians, position vacancies, new hires, and certification status. The second section, on district policies, obtains information on teacher salary schedules and benefits, incentives, hiring and retirement policies, and high school graduation requirements. Race-ethnicity data on the student population and the teacher work force are also collected. The corresponding sections for private schools are incorporated into the Private School questionnaire. The data derived from this survey permit an assessment of teacher demand and shortage, the estimation of the number of teachers who hold certification in their field of assignment, and the effect of various policies on teacher supply and demand balances.
- The School Principal questionnaire obtains information about the age, sex, race/ethnicity, training, experience, salary, benefits, opinions, and attitudes of school principals/headmasters. Q uestions required both objective responses (e.g., number of years of teaching experience) and judgmental responses (e.g., ranking the seriousness of school problems). The data derived from this survey provide insight into qualifications of school principals, which school problems principals view as serious, and how principals perceive their influence on school policies.
- $\quad$ School questionnaires were sent to public schools and private schools. The private school version of the questionnaire included items for identifying the religious or other affiliation of the school. This survey obtained information about schools such as student characteristics, staffing patterns, student/teacher ratios, types of programs and services offered, length of school day and school year, graduation and college application rates, and teacher turnover rates. These data provide information about the teaching experience of the staff, the sources of newly hired teachers, and the destinations of teachers who left the school the previous year.
- Teacher questionnaires were sent to teachers in public and private schools. The two versions of the questionnaire were virtually identical. The survey collected data from teachers regarding their education and training, teaching assignment, teaching experience, certification, teaching workload, perceptions and attitudes about teaching, job mobility, and workplace conditions. This information permits analyses of how these factors affect movement into and out of the teaching profession.

In addition to these four main components, the 1993-94 SA SS featured: (1) similar principal, school, and teacher components specific to federally funded Bureau of Indian A ffairs or tribally run Indian schools, (2) new components focusing on Library M edia Specialists/Librarians and Library/M edia Centers, and (3) a new student records component. Future reports will feature data from these new components.

C opies of the questionnaires used in the SA SS can be obtained by writing to:
Schools and Staffing Survey Questionnaires

W ashington, DC 20208-5651

## II. Target Population and Estimates for SA SS

Target P opulations. The target populations for 1993-94 SA SS were:

- Local Education A gencies (LEA s) that employ elementary and/or secondary level teachers (for example: public school districts, state agencies that operate schools for special student populations, such as inmates of juvenile correctional facilities, and cooperative agencies that provide special services to more than one school district).
- Public and private schools with students in any of grades 1-12.
- Principals of those schools.
- $\quad$ Teachers in public and private schools who teach students in grades K-12.

E stimates. The SA SS was designed to support estimates at both the state and national levels for the public sector, and at the national and association levels for the private sector. The association groups for private schools were determined by the school's association or affiliation group listed on the 1991-92 Private Schools Survey (the frame) and updated with 1992-93 association lists. The association groups were determined in the following order:

1) Military - membership in the A ssociation of A merican Military Colleges and Schools;
2) C atholic - affiliation as C atholic or membership in the N ational C atholic Education A ssociation or the Jesuit Secondary Education A ssociation;
3) Friends - affiliation as Friends or membership in the Friends C ouncil on Education;
4) Episcopal - affiliation as Episcopal or membership in the $N$ ational $A$ ssociation of Episcopal Schools;
5) Hebrew Day - membership in the $N$ ational Society for Hebrew Day Schools;
6) Solomon Schechter - membership in the Solomon Schechter Day Schools;
7) Other Jewish - other Jewish affiliation;
8) M issouri Synod - membership in the Lutheran Church, M issouri Synod;
9) Wisconsin Synod - membership in the Evangelical Lutheran Church - W isconsin Synod or affiliation as Evangelical Lutheran - Wisconsin Synod;
10) Evangelical Lutheran - membership in the A ssociation of Evangelical Lutheran Churches or affiliation as Evangelical Lutheran Church in A merica;
11) Other Lutheran - other Lutheran affiliation;
12) Seventh-Day A dventist - affiliation as Seventh-Day A dventist or membership in the $G$ eneral C onference of Seventh-Day A dventists;
13) Christian Schools International - membership in Christian SchoolsInternational;
14) A ssociation of Christian Schools International - membership in the A ssociation of Christian Schools International;
15) National A ssociation of Private Schools for Exceptional C hildren - membership in the N ational A ssociation of Private Schools for Exceptional C hildren;
16) M ontessori - membership in the A merican M ontessori Society or other M ontessori associations;
17) $N$ ational $A$ ssociation of Independent Schools - member of the $N$ ational A ssociation of Independent Schools;
18) $N$ ational Independent Private School A ssociation - member of the $N$ ational Independent Private School A ssociation;
19) All else - member of any other association specified in the PSS or affiliated with a group not listed above or not a member of any association.

Comparisons between public and private schools are only possible at the national and regional levels, because private schools are selected for sampling by association group and not by geographic location, such as state.

The teacher survey was designed to support comparisons between new and experienced teachers. Comparisons between bilingual and nonbilingual teachers are possible at the national level.

## III. Sample D esign and Implementation ${ }^{8}$

## A. Sampling Frames

## 1. Public Schools

The public school sampling frame was based on the 1991-92 school year CCD, which is a file of information collected annually by NCES from all state education agencies and which is believed to be the most complete public school listing available. The frame includes regular public schools, Department of Defense operated military base schools, and special purpose schools such as special education, vocational, and alternative schools. A fter the deletion of duplicate schools, schools outside of the U nited States, and schools that only teach prekindergarten, kindergarten, or postsecondary students, there were a total of 82,746 schools on the public school frame.

## 2. Private Schools

The sampling frame for private schools was the 1991-92 Private School Survey, updated with 1992-93 association lists (Broughman et al. 1994). This data collection uses two components to develop estimates of the number of private schools in the U nited States. A list frame was the primary private school frame and an area frame was used to identify schools not included on the list frame and thereby to compensate for the undercoverage of the list frame.

## B. Sample Selection Procedures

Schools are the primary sampling unit in SA SS. Public schools were selected to be representative at the national and state levels; private schools were selected to be representative at the national and association levels. M ore detail is available in A bramson et al. (1996).

O nce schools were selected, LEA s associated with these schools were in sample as well. H ence, the LEA sample consisted of the set of LEA s that were associated with the SA SS public school sample. This provided the linkage between the LEA and the school.

Each selected school was asked to provide a list of their teachers and selected characteristics. $N$ ine percent of the private schools and 4 percent of the public schools did not provide teacher lists. A factor in the teacher weighting system was used to adjust for these nonparticipant schools.

## C. Sample Sizes

Tables III-1 and III-2 show the sample sizes and number of interview cases for each questionnaire, by state and private school typology, respectively.

[^4]The number in sample is the number of in-scope, or eligible cases. This number excludes the out-of-scope cases, which are drawn for the sample but are not eligible for interview. For example, a school which has closed or a teacher who has left the country would be considered out-of-scope.

The number of interviews is the number of in-scope (eligible) cases minus the noninterview cases. The noninterview cases include refusal sor sample questionnaires with too little valid data to be considered complete interviews for the survey. The number of interviews is the actual unweighted number of cases upon which estimates in this report are based. A nonresponse adjustment is included in the weights to reduce the bias due to nonresponse.

Table III-1- Number of in-scope sample cases and number of interviews, public school districts, principals, schools, and teachers: SA SS 1993-94

N OTE: The number of in-scope cases in sample is the actual sample size achieved, less out-of-scope cases. Out-of-scope cases are drawn for the sample but not eligible for interview. Districts may have merged, schools closed, or there may not have been a permanent principal assigned at the time of interview, for example. There are still other reasons for a case to be considered out-of-scope.

## V. Response $R$ ates

## A. Survey R esponse R ates

The weighted response rates for each component of SA SS are detailed in tables $\mathrm{V}-1$ and $\mathrm{V}-2$. Table V-1 provides public response rates by state for districts, schools, administrators, and teachers. Table V-2 lists private response rates by private school typology for administrators, schools, and teachers. The response rate tables are useful as an indication of possible nonresponse bias.

The weighted response rates were derived by dividing the sum of the basic weights for the interview cases by the sum of the basic weights for the eligible cases. The basic weight for each sample case was assigned at the time of sampling and is the inverse of the probability of selection.

Teacher response rates refer to the percentage of teachers responding in schools that provided teacher lists for sampling. N ine percent of private schools and 4 percent of public schools did not send in teacher lists. The effective response rate is calculated by multiplying together the teacher list rate and the response rate:

Public teachers: $.96 \times .882=.8467 \times 100=84.7 \%$ effective response rate Private teachers: . $91 \times .801=.7289 \times 100=72.9 \%$ effective response rate

SOU RCE: U.S. Department of Education, N ational C enter for Education Statistics, Schools and Staffing Survey, 1993-94 (Teacher Demand and Shortage Q uestionnaire, Principal Questionnaire, School Q uestionnaire, and Teacher Q uestionnaire).

## B. Item Response $R$ ates

The unweighted item response rates (i.e., the number of sample units responding to an item divided by the number of sample units that participated in the survey) for the SA SS and the Library Survey ranged from 50 percent to 100 percent. Tables V-3 and V-4 provide a brief summary of the item response rates. The item response rates in these tables are unweighted, and do not reflect additional response loss due to respondents' refusal to participate in the survey.

Table V-3. - Summary of unweighted item response rates by questionnaire

| Survey | R ange of item response rates | Percent of items with a response rate of $90 \%$ or more | Percent of items with a response rate of less than 75\% |
| :---: | :---: | :---: | :---: |

## V I. Imputation Procedures

For questionnaire items that should have been answered but were not, values were imputed by (1) using data from other items on the questionnaire, (2) extracting data from a related component of the Schools and Staffing Survey (for example, using data from a school record to impute missing values on that school's LEA questionnaire), (3) extracting data from the sample file (information about the sample case from other sources; for example, the Private School Survey or the C ommon C ore of Data, collected in the 1991-92 school year), and (4) extracting data from a respondent with similar characteristics.

For some incomplete items, the entry from another part of the questionnaire or information from the sample file was directly imputed to complete the item; for others the entry was used as part of an adjustment factor with other data on the incomplete record. For example, if a respondent did not report whether a school offered remedial reading in item 22a of the public school questionnaire, the response ( $1=$ Yes or $2=\mathrm{No}$ ) for a similar school was imputed to item 22a of the incomplete record. However, if a respondent had answered "Yes" to item 22a but had not reported the number of students in the program, the ratio of number of students in remedial reading to the total enrollment for a similar school was used with the enrollment at the school for which item 22a was incomplete to impute an entry to item 22a (i.e., SCHOOL

A item 22a $=$ SCHOOL A ENROLLMENT multiplied by the ratio of SCHOOL B item 22a to SCHOOL BENROLLMENT).

Values were imputed to items with missing data for records that had been classified as interviews (ISR=1). N oninterview adjustment factors were used during the data weighting process to compensate for data that were missing because the sample case was a noninterview (ISR=2). For more information about imputation procedures, see A bramson et al. (1996).

## V II. W eighting ${ }^{10}$

W eighting of the sample units from the public sector was carried out to produce national and state estimates for public schools, teachers, principals, and LEA s. The private sector was weighted to produce national and association group estimates.

## VIII. Standard Errors

Estimates found in the tables of this report are based on samples and are subject to sampling variability. Standard errors were estimated using a bal anced repeated replications procedure that incorporates the design features of the stratified, clustered sample. The standard errors provide indications of the accuracy of each estimate. If all possible samples of the same size were surveyed under the same conditions, an interval of 1.96 standard errors below to 1.96 standard errors above a particular statistic would include the universe value in approximately 95 percent of the cases. N ote, however, that the standard errors do not take into account the effects of biases due to item nonresponse, measurement error, data processing error, or other systematic error. Estimates with large standard errors (coefficient of variation greater than 30 percent) should be interpreted with caution.

## IX. C autions C oncerning C hange Estimates

C are must be taken in estimating change over time in a SA SS data element, because some of the measured change (e.g., an 8 percent increase in the number of students receiving C hapter 1 services) may not be attributable to a change in the education system. Some of the change may be due to changes in the sampling frame, to a questionnaire item wording, or other changes detailed in A bramson et al. (1996).

[^6]
## X. Definitions

The following survey terms are defined as they apply to SA SS.
Local E ducation A gency (LE A). A n LEA, or public school district, is defined as a government agency that employs elementary or secondary level teachers and is administratively responsible for providing public elementary and/or secondary instruction and educational support services.

Districts that do not operate schools but employ teachers are included. For example, some states have special education cooperatives that employ special education teachers who teach in schools in more than one school district.

Public School. A public school is defined as an institution that provides educational services for at least one of grades 1-12 (or comparable ungraded levels), has one or more teachers to give instruction, is located in one or more buildings, receives public funds as primary support, and is operated by an education agency. Schools in juvenile detention centers and schools located on military bases and operated by the Department of Defense are included.

Private School. A private school is defined as a school not in the public system that provides instruction for any of grades 1-12 (or comparable ungraded levels). The instruction must be given in a building that is not used primarily as a private home.

Teacher. A teacher is defined as a full-time or part-time teacher who teaches any regularly scheduled classes in any of grades K-12. This includes administrators, librarians, and other professional or support staff who teach regularly scheduled classes on a part-time basis. ${ }^{11}$ Itinerant teachers are included, as well as long-term substitutes who are filling the role of a regular teacher on a long-term basis. A $n$ itinerant teacher is defined as a teacher who teaches at more than one school (for example, a music teacher who teaches three days per week at one school and two days per week at another). Short-term substitute teachers and student teachers are not included.

Special E ducation School. Special education schools focus primarily on direct instructional activities required to educate students with mental handicaps, such as mental retardation; physical handicaps, such as hearing- and speech-impairment, and learning disabilities, such as dyslexia.

Typology. C ategories (three major with three sub-categories each) into which private schools are divided: (1) Catholic - parochial, diocesan, private; (2) Other religious - affiliated with a Conservative Christian school association, affiliated with a national denomination, unaffiliated; (3) N onsectarian - regular, special program emphasis, special education (M cM illen and Benson 1992).

[^7]In the case of other religious schools, recent work (C arper and H unt 1984) documents major differences in decisionmaking, educational goals, revenue, and enrollment trends between denomination schools (i.e., Lutheran, Jewish, Seventh-day A dventist) and those nondenominational schools affiliated with a C onservative C hristian school association (e.g., A ccelerated C hristian Education, A merican A ssociation of C hristian Schools, A ssociation of Christian Schools International, O ral R oberts Educational Fellowship). This category is reportedly the fastest growing private school sector. Schools in this type are commonly known as evangelical or fundamental, and are not tied to a denomination per se, but rather are governed by a single church, a foundation, or a local society. A third Other Religious category, U naffiliated, is suggested to capture those religious schools which affiliate with neither a national denomination nor with a conservative Christian school association.

The three nonsectarian school categories are determined not by governance but by program emphasis. This classification disentangles private schools offering a conventional academic program (Regular) from those which either serve special needs children (Special Education) or provide a program with a Special Emphasis (e.g., arts, vocational, alternative).

Common Core of $\mathbf{D}$ ata. The Common Core of Data is a group of surveys that acquire and maintain public elementary and secondary education data from the 50 states, the District of C olumbia, and the outlying areas through the state-level (or equivalent) education agencies. Information about staff and students in public schools is collected annually at the school, LEA (local education agency or school district), and state levels. Information about revenues and expenditures is also collected at the state level.

N ewly hired teachers. N ewly hired teachers are teachers who were newly hired by the school district for the 1993-94 school year. It includes teachers returning from unpaid leave of absence of one school year or more, but does not include substitute teachers.

[^0]:    ${ }^{1}$ A lthough fifth grade is often considered to be an elementary grade, the data show that students at this grade level were likely to be taught by multiple teachers and not to be in self-contained classrooms.

[^1]:    ${ }^{2}$ Teachers who reported that they spent 0 hours on core curriculum were found primarily to be teachers who were working with learning disabled or emotionally disturbed students and thus were dropped from the sample for this study. In addition, teachers who reported teaching core curriculum for more than 40 hours a week were also dropped, as the school week generally ranged from 30 and 36 hours a week. Some latitude was granted since teachers who, for example, required students to write history reports could count that time as being spent on both history and English; however, since very few teachers reported spending more than 40 hours a week teaching and because no school week lasted longer than 40 hours, 40 hours was chosen as the cut-off point. Both of these restrictions together resulted in less than 3 percent of the sampled teachers being excluded.

[^2]:    ${ }^{3}$ T eachers reported the amount of time they spent on core subjects in hours per week. In some cases, this has been transformed into hours per day by dividing by 5 or into minutes per week by converting hours to minutes. These numbers will not be precise since they reflect any rounding teachers may have done in responding to the question.
    ${ }^{4} \mathrm{~N}$ ote that the differences in the increasing length of the school day between public and private schools is within sampling variation and is not statistically significant.

[^3]:    ${ }^{5}$ A nalysis of raw hours spent on social studies shows no difference between third and fourth grade.
    ${ }^{6}$ A nalysis of raw hours spent on science shows no difference between third and fourth grade.
    ${ }^{7}$ Private schools can be broken down into nine categories using the typology developed by M cM illen and Benson (1991), which consists of three types of C atholic schools (parochial, diocesan, and private order), three other religious-oriented schools (conservative C hristian, nationally affiliated, and unaffiliated), and three nonsectarian schools (regular, special emphasis, and special education). For the purpose of this analysis, private order C atholic schools were omitted since they are predominately at the secondary level and there were too few cases at the elementary level to anal yze.

[^4]:    ${ }^{8}$ For a detailed description of the sample design, see A bramson et al. (1996).

[^5]:    ${ }^{9}$ The questionnaire wording for these items can be found in The Schools and Staffing Surveys: 1993-1994, D ata File U ser's M anual, a forthcoming N C ES publication.

[^6]:    ${ }^{10}$ For a detailed description of the weighting processes, see A bramson et al. (1996).

[^7]:    ${ }^{11}$ This represents a change in the definition of teacher from previous administrations of SA SS. In 1987-88 and 1990-91 a teacher was defined as any full-time or part-time teacher whose primary assignment was teaching in any of grades $\mathrm{K}-12$. The prior definition excluded administrators and other staff who taught regul arly scheduled classes, but whose primary assignment was not teaching.
