Acting Commissioner
The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.
NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to:

## Executive Summary

## I. INTRODUCTION

With the advent of the 21st century, vocational education in the United States is in transition. Historically, the purpose of vocational education has been to prepare students for entry-level jobs in occupations requiring less than a baccalaureate degree. Over the last 15 years, however, this purpose has shifted toward broader preparation that develops the academic, vocational, and technical skills of students in vocational education programs. This preparation involves integrating academic and vocational education, emphasizing all aspects of an industry, and implementing academic performance measures, among other reform efforts. Vocational education policy now also encourages high school students to continue their studies at the postsecondary level, and 2year postsecondary students to pursue 4 -year credentials through various articulation or "techprep" arrangements. The traditional focus of vocational education is giving way to a broader pur-pose-one that includes greater emphasis on academic preparation and provides a wider range of career choices.

Vocational Education in the United States: Toward the Year 2000 attempts to capture this evolving enterprise. In addition to describing trends in participation in secondary and postsecondary vocational education, the report also presents findings about the academic preparation of high school students who participate in vocational education, relevant school reform efforts, and transitions after high school. However, the surveys available for assessing the status of vocational education were generally designed to capture more traditional conceptions of the enterprise and often do not provide information on the most current reform efforts. Nevertheless, the available data do signal that change is occurring in the directions advocated by reform efforts, although such change is often small and preliminary. The report also describes economic and labor market trends and their implications for vocational programs, as well as changing workplace practices and employer perspectives on worker skills and proficiency. The most important findings presented in the report are highlighted below.

## II. THE CONTEXT

## Economic Trends (page 15)

The United States is shifting from a manufacturing-based economy to one that overwhelmingly provides services and information. These trends have two important implications for vocational education programs. They signal an ongoing shift in the education and training fields that are required of the U.S. work force as well as shifts in the levels of that education and training. Vocational programs that prepare students for manufacturing jobs include trade and industry programs, such as construction, mechanics and repair, precision production, and transportation and material moving. Vocational programs that prepare students for jobs in the services and information industries include health care and technology and communications, among others.

## Changing Education and Skill Requirements (page 24)

Generally, the research literature describes a trend toward greater education and training requirements and a greater need for critical thinking, personal responsibility, and social skills among work force participants. For example, recent projections anticipate that average growth will be greater for occupations requiring at least an associate's degree than for occupations requiring less education. However, these trends are not uniform across industries and occupations, and some disagree about their magnitude. Some emerging occupations require high education and training requirements (such as a bachelor's degree or moderate- to long-term on-the-job training), while many jobs still demand relatively low education and training levels. In 1996, 39 percent of all jobs required no more than short-term on-the-job training.

Understanding these economic and labor market trends provides a context for analyzing trends in vocational education. For example, if participation in vocational programs parallels changes in the economy, one would expect to see a decline in enrollments in trade and industry programs in recent years and an increase in enrollments in service- and information-related programs. Similarly, if vocational education reflects the labor market trend toward greater education and training requirements, one would expect to find that the academic preparation of students participating in vocational education has increased in recent years and that more of these participants are seeking and obtaining higher education and training credentials. These issues are addressed in sections IV-VI below.

## III. EMPLOYER PERSPECTIVES ${ }^{1}$

## Workplace Practices (page 34)

Changes in the economy and in education are altering workplace practices, which have implications for the skills required of employees. Increased global competition has spurred some U.S. businesses to create "high-performance workplaces," relying on flexible and decentralized work practices and multi-skilled workers. These firms, however, are still in the minority. For example, 20 percent of surveyed employers reported engaging in performance benchmarking in 1997, and 25 percent had undergone reengineering. Larger firms were more likely than smaller firms to report these practices, indicating that the percentage of employees affected by these practices may be greater than the percentage of employers reporting them.

Also, the 1994 School-to-Work Opportunities Act advocated employer involvement in school-to-work partnerships and wider implementation of work-based learning, including job shadowing, mentoring, internships, and apprenticeships. Once again, however, a minority of firms reported participating in these activities. One-quarter of surveyed employers reported participating in a school-to-work partnership, and 42 percent reported providing at least one formal work-based learning activity. As above, larger firms were more likely than smaller firms to report these different practices.

## Perspectives on Employees (page 38)

While the general labor market trend may be toward higher education and training requirements, employers have a unique perspective, which is particularly important in the short term. When hiring front-line workers from an established applicant pool, surveyed employers did not rate years of completed schooling or academic performance as highly as attitude and communication skills. However, it may be that years of completed schooling and academic performance are more important during initial applicant screening. It may also be that employers have historically found that schooling measures are not reliable indicators of what students know and can do.

With the evolving economy and changes in education and skill requirements, attention over the last two decades has focused on whether employees are adequately prepared for the demands of the workplace. According to most surveyed employers, the proficiency of their production

[^0]workers either stayed the same or increased in recent years. ${ }^{2}$ In addition, the majority of employers with new production employees who participated in work-based learning reported that these employees were superior to comparable new hires in terms of productivity and attitude. Virtually no employers reported that employees with work-based learning experience were inferior in these two respects to comparable new hires. ${ }^{3}$

## IV. TRENDS IN SECONDARY VOCATIONAL EDUCATION ${ }^{4}$

## Participation in High School Vocational Education (page 49)

From 1982 to 1994, there was a general decline in the participation of high school students in vocational education (figure A). The average number of vocational credits public high school graduates earned decreased over the period studied, as did the percentage of graduates completing a sequence of related occupational courses. ${ }^{5}$

Trade and industry and business were the most popular occupational programs in 1994about 8 percent of public high school graduates concentrated in each of these areas. These were also the most popular programs in earlier years. However, consistent with reported economic trends, the percentage of graduates concentrating in trade and industry declined over the period studied, as did the percentage of graduates concentrating in business. (In 1982, about 15 percent of graduates had concentrated in trade and industry, and 12 percent in business.) Exhibiting an opposite trend, the proportions of students concentrating in health care and in technology and communications almost doubled between 1982 to 1994. Nevertheless, the percentages of high school graduates concentrating in these program areas in 1994 were still quite small (about 1 percent each).

[^1]Figure A-Average number of vocational credits earned by public high school graduates and percentage of public high school graduates concentrating (accumulating 3 or more credits) in vocational programs: 1982, 1990, 1994

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

## Characteristics of High School Students Participating in Vocational Education (page 52)

Although participation in vocational education declined for most groups of public high school students between 1982 and 1994, there were a few exceptions to this trend. The percentages of black, non-Hispanic students and Asian/Pacific Islander students concentrating in vocational education stayed about the same over this period, and the concentration rate of students with disabilities increased. The increase in participation of students with disabilities is consistent with the emphasis of the 1990 Perkins Act on serving students with special needs.

## Academic Course-Taking Trends (page 62)

The academic preparation of high school students participating in vocational education increased between 1982 and 1994, in both absolute and relative terms (figure B). While public high school graduates generally increased their coursetaking in the core academic subjects (English, mathematics, science, and social studies), the rate of increase was greater for vocational concentrators than for either college preparatory students or those completing general coursework in
high school. Vocational concentrators also generally increased the rigor of their academic coursework, particularly in mathematics, science, and social studies. However, in 1994, vocational concentrators still completed fewer total credits in each of the core academic subjects than did either college preparatory students or those completing general coursework in high school.

Figure B-Percentage of public high school graduates meeting the New Basics core academic standards, ${ }^{1}$ by curriculum specialization in high school: 1982, 1990, and 1994

[^2]SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

## School Reform Efforts ${ }^{6}$ (page 81)

By 1997, some public comprehensive high schools had implemented vocational educationrelated reforms, although the quality and specific forms of these efforts were not discernible from the available survey data. About half of these schools reported integrating academic and vocational education, and a similar proportion reported offering tech prep. Fewer schools reported having block scheduling, career majors, school-based enterprises, skill standards, or skill or

[^3]occupational certificates. Generally, schools with career academies and larger schools were more likely to report these reforms, while rural schools were less likely to do so.

## Vocational Teacher Qualifications and Experience ${ }^{7}$ (page 93)

Vocational and academic high school teachers were similar in a number of ways: about the same proportions held bachelor's degrees, and similar percentages held either standard or advanced certification. However, about 8 percent of vocational teachers had less than a bachelor's degree, in comparison with less than 1 percent of academic teachers. ${ }^{8}$ Also, vocational teachers were generally older than academic teachers, which may be due to the fact that vocational teachers entered the teaching profession at an older age, possibly after obtaining industry experience. There were some variations among vocational teachers who taught in different program areas and school settings. For example, trade and industry and technical teachers and those teaching in more than one vocational field were generally less likely than other vocational teachers to have a bachelor's or advanced degree.

## V. TRANSITIONS AFTER HIGH SCHOOL ${ }^{9}$

## The Transition to Postsecondary Education: 2 Years After High School (page 109)

The postsecondary enrollment rates of public high school graduates showed a marked increase between 1982 and 1992. About half of those students graduating in 1982 enrolled in a postsecondary institution within 2 years, while about three-fourths of the more recent graduating class enrolled within 2 years. Between 1982 and 1992, postsecondary enrollment rates increased for vocational concentrators and students completing general coursework in high school, but not for college preparatory graduates (figure C). While the gap in enrollment rates among the three groups of students appeared to be narrowing, 1992 vocational concentrators were still less likely than their college preparatory peers and those completing general coursework in high school to enroll in a postsecondary institution within 2 years. However, vocational concentrators who also completed a college preparatory curriculum had enrollment outcomes that were more like those of their college preparatory peers than did strictly vocational concentrators.

[^4]Figure C—Percentage of 1982 and 1992 public high school graduates enrolling in postsecondary institutions by 1984 and 1994, respectively, by curriculum specialization in high school

*Includes students who completed both a vocational concentration and a college preparatory curriculum.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Second Follow-up Survey, and National Education Longitudinal Study of 1988, Third Follow-up and High School Transcript Study.

Vocational concentrators were more likely than students completing general coursework in high school to obtain a degree or certificate within 2 years, despite the fact that the two groups enrolled at similar rates in community colleges and that vocational concentrators were more likely to be employed while in school.

## The Transition to Postsecondary Education: 10 Years After High School (page 118)

Among 1982 graduates, vocational concentrators were less likely than either their college preparatory peers or students completing general coursework in high school to enroll in postsecondary education by 1992. However, vocational concentrators who also completed a college preparatory curriculum were about as likely as college preparatory graduates to enroll during this 10-year period.

## Postsecondary Completion 10 Years After High School (page 129)

More than half of 1982 public high school graduates who enrolled in postsecondary education completed a degree or certificate by 1992. Vocational concentrators had lower overall rates of postsecondary completion than their peers. However, vocational concentrators who also completed a college preparatory curriculum were as likely as college preparatory graduates to earn a postsecondary degree or certificate during this period. Among graduates who enrolled in postsecondary education by 1992, vocational concentrators were less likely than their peers to earn a bachelor's degree, but more likely to obtain a certificate or an associate's degree.

## Labor Market Outcomes 2 Years After High School (page 132)

Labor market outcomes 2 years after leaving high school were similar for the graduating classes of 1982 and 1992. In both cases, about three out of four public high school graduates were in the labor force. Vocational concentrators in both graduating classes were more likely than their college preparatory peers to be in the labor force 2 years after graduation. While 1992 public high school graduates had similar labor market experiences regardless of their course of study in high school, 1982 college preparatory graduates tended to have lower unemployment rates than vocational concentrators and those completing general coursework in high school. This difference between the two graduating classes may be due to shifts over the decade in economic conditions, changes in the academic preparation of high school graduates, or other factors.

## Labor Market Outcomes 10 Years After High School (page 135)

Vocational concentrators and students completing general coursework in high school had similar labor market outcomes 10 years after graduation from high school. While the number of months employed and unemployed was similar regardless of students' course of study in high school, college preparatory graduates tended to enjoy higher earnings in 1991 than their peers, possibly because of their greater postsecondary attainment. Obtaining a bachelor's degree was generally associated with increased earnings and lower unemployment rates. At the other end of the educational spectrum, students who earned a postsecondary certificate had similar annual earnings and unemployment rates as their peers who did not complete a postsecondary degree or certificate. Both those who held a postsecondary certificate and those who held a high school diploma earned less and were more likely to be unemployed in 1991 than graduates who held an associate's degree or higher.

## VI. TRENDS IN POSTSECONDARY VOCATIONAL EDUCATION10

## Trends in Educational Attainment (page 149)

The United States has experienced both greater educational participation and higher attainment in recent years, continuing long-standing patterns. More people are attending postsecondary institutions than ever before, and the average educational attainment of the adult population has been steadily rising. While the total number of adults who earned vocational associate's degrees appeared to increase slightly between 1992 and 1996, this difference was not statistically significant. However, the total number of adults who held academic associate's degrees increased over the 4 years by approximately an additional 1 million people. ${ }^{11}$

Although postsecondary enrollments overall have shown recent increases, there is no evidence that bachelor's degree holders are returning in large numbers for additional undergraduate schooling, as some have speculated. In particular, small proportions of students who were pursuing associate's degrees or certificates had already earned a bachelor's or advanced degree. The vast majority of students who enroll in postsecondary education are pursuing a higher level credential than the one they currently possess. However, this report focused on students who participate in for-credit postsecondary programs. It may be that a significant number of bachelor's degree holders are taking noncredit, adult, or continuing education courses.

## Participation in Postsecondary Vocational Education (page 152)

Vocational coursework represents a substantial component of subbaccalaureate students' education. Among all subbaccalaureate students, about one-half majored in a vocational program area in 1996; the proportion decreased from 54 to 49 percent over the 6 years from 1990 to 1996. ${ }^{12}$ There was an increase between 1990 and 1996 in the proportion of postsecondary vocational students being served by community colleges, with a corresponding decrease at private proprietary institutions (figure D).

[^5]Figure D—Percentage distribution of subbaccalaureate students reporting a vocational major according to type of postsecondary institution: 1989-90 and 1995-96

*Other institution types include public 4-year; private, not-for-profit 4-year; private, not-for-profit less-than-4-year; and public vocational-technical institutions.

NOTE: Percentages may not add to 100 due to rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 and 1995-96 National Postsecondary Student Aid Study.

## Subbaccalaureate Student Characteristics (page 157)

Subbaccalaureate students with vocational majors were more likely to be older, to have family responsibilities, to receive financial aid, to have a previous postsecondary degree or certificate, and to report higher postsecondary grade-point averages (GPAs) than their academic counterparts. These students with vocational majors also tended to have parents with lower educational attainment: as the education level of their parents increased, students' likelihood of reporting a vocational major generally decreased. Differences by race-ethnicity among subbaccalaureate students in their probability of having a vocational major were either minimal or not statistically significant. Also, among subbaccalaureate students, there was no clear association between majoring in a vocational field and disability status.

## Specific Occupational Preparation (page 164)

Business, health, and technical fields (the latter including engineering/science technologies, computers/data processing, and protective services) accounted for large numbers of vocational students' majors. However, between 1990 and 1996, there were small decreases in the proportions of subbaccalaureate students reporting majors in business, marketing, computers/data processing, and engineering/science technologies. Thus, the absolute level of participation in service-
and information-related programs was relatively high in 1996, while the trend in these areas was generally downward over the 6-year period.

Among subbaccalaureate students, gender gaps persisted in the fields of business, health, and "other vocational" fields (where women predominated), as well as in trade and industry, protective services, computers/data processing, and engineering/science technologies (where men predominated). A particularly large gap between the participation of men and women occurred in 1996 in engineering/science technologies, a field in which 12 percent of male students and only 2 percent of female students declared a major.

## Postsecondary Completion (page 172)

Among the group of students who first began their postsecondary studies in 1989-90, those with academic majors were more likely than those with vocational majors to have completed at least one postsecondary credential 4 years later. However, a majority of both academic and vocational majors completed some type of degree or certificate within 4 years.

## VII. CONCLUSION

This publication describes vocational education at the turn of the century as an enterprise in transition. The available data signal that change is occurring in the directions advocated by recent reform efforts, in particular, improved academic preparation and greater postsecondary participation. Evidence of change includes findings that the academic preparation of public high school students participating in vocational education increased between 1982 and 1994; about half of public comprehensive high schools reported integrating academic and vocational education in 1997, and a similar proportion reported offering tech prep; and from 1982 to 1992, postsecondary enrollment rates within 2 years of public high school graduation increased significantly for vocational concentrators.

There is mixed evidence that trends in participation in vocational programs reflect economic shifts away from manufacturing toward services and information industries. For example, at the high school level, the percentage of graduates who concentrated in trade and industry declined between 1982 and 1994, and the proportions of students who concentrated in health care and in technology and communications increased over the period. However, the percentages of high school graduates who concentrated in health care and in technology and communications were still quite small in 1994 (about 1 percent each). At the postsecondary level, for example, health and engineering/science technologies were popular vocational majors in 1996. However, there were small decreases between 1990 and 1996 in the proportions of subbaccalaureate
students reporting majors in computers/data processing and in engineering/science technologies. Thus, data on trends in and levels of participation in health and technology programs provided conflicting information about whether vocational program participation is paralleling the economic shift toward services and information industries.

## Foreword

In 1987, the National Center for Education Statistics (NCES) instituted a new approach to collecting and reporting data on vocational education. Under the new approach, vocational education data are collected primarily through general purpose surveys rather than separate vocational education questionnaires. This arrangement allows NCES to situate vocational education activities within the broader education context. In 1998, a Technical Review Panel was formed to provide NCES with regular input on its Data on Vocational Education (DOVE) program.

This report is the third in a series published by NCES. The first two reports, Vocational Education in the United States: 1969-1990 and Vocational Education in the United States: The Early 1990s, were published in 1992 and 1995, respectively. Each describes vocational education in America, updating key trends based on available data and focusing on selected issues relevant to current policy discussions. The first publication had about one page of text dedicated separately to each of 60 tables. The second provided a 25-page synthesis of data from over 100 tables published as an appendix to the report. This third publication incorporates relevant tables and figures into a more detailed analysis of vocational education trends toward the year 2000.

NCES intends to continue producing a report on the status of vocational education about every 3 years. In the future, different analytic approaches may be tried and various related products produced. Your comments about the NCES vocational education publication series are welcome and may be sent to Lisa Hudson, NCES, 555 New Jersey Avenue, NW, Room 3106, Washington, DC 20208.

## Acknowledgments

The authors of this report would like to thank many individuals who contributed to the preparation of Vocational Education in the United States: Toward the Year 2000. First, the report was prepared under the thoughtful direction of Dawn Nelson of the Early Childhood, International, and Cross-cutting Studies Division of the National Center for Education Statistics (NCES). In addition to her guidance and encouragement, other NCES staff-including Lisa Hudson, John Ralph, Martin Orland, Ellen Bradburn, and Mary Frase (now at the National Science Foundation)—also contributed valued advice at various stages of report preparation, including design, analysis, and writing.

Members of the NCES Vocational Education Technical Review Panel and its precursor groups also provided useful insights and suggestions about methodology, scope, format, and emphasis of the report. These experts included John Bishop of Cornell University, Rosalind Bruno of the Census Bureau, David Burkam of the University of Michigan, Steve Equall of the Nebraska Department of Education, David Goodwin of Planning and Evaluation Services, Kim Green of the National Association of State Directors of Vocational Technical Education, J.D. Hoye formerly of the National School-to-Work Office, Chris Lyons of the Maine Department of Education, Russ McCampbell of the Missouri Department of Education, Jim McKenney and Margaret Rivera of the American Association of Community Colleges, Robert Meyer of the Universities of Wisconsin and Chicago, Richard Miguel of the Illinois State Board of Education, William Mockovak of the Bureau of Labor Statistics, Gail Schwartz of the National School-toWork Office, Nevzer Stacey of the Office of Educational Research and Improvement, and Patricia McNeil, Doris Werwie, Mark Schwartz, Nancy Brooks, Mike Dean, and Dennis Berry of the Office of Vocational and Adult Education.

A number of MPR Associates staff also contributed to the report. Technical assistance was provided by Nicole Joyner, Jennifer Berktold, Robin Henke, Phillip Kaufman, Robert Fitzgerald, Michael Clune, Lutz Berkner, and Shirley He. Additionally, Barbara Kridl, Andrea Livingston, Karyn Madden, Francesca Tussing, Mary Mack, Leslie Retallick, Erika Collin, and Stacie Chun provided invaluable production, editorial, graphics, and administrative assistance.

## Table

12 Percentage distribution of employers reporting that the proficiency of front-line workers has increased, decreased, or remained the same during the last 3 years, by firm revenues: 1997.42

13 Among firms with employees with work-based learning (WBL) experience, percentage distribution of employers according to their evaluations of new front-line workers with WBL experience versus their non-WBL counterparts aged 18-25, by selected employee characteristics: 1997.44

14 Average number of Carnegie units accumulated by public high school graduates, by type of coursework: 1982, 1990, and 199450

15 Percentage of public high school graduates concentrating (accumulating 3 or more credits) and specializing (accumulating 4 or more credits with 2 or more of those credits beyond the introductory level) in vocational programs: 1982, 1990, and 1994 .. 52

16 Percentage of public high school graduates concentrating (accumulating 3 or more credits) in various vocational programs: 1982, 1990, and 199453

17 Average number of Carnegie units accumulated by public high school graduates, by type of coursework and sex: 1982, 1990, and 199455

18 Average number of Carnegie units accumulated by public high school graduates in the vocational and specific labor market preparation curricula, by race-ethnicity: 1982, 1990, and 1994

19 Average number of Carnegie units accumulated by public high school graduates, by type of coursework and disability status: 1982, 1990, and 1994.

20 Average number of Carnegie units accumulated by public high school graduates, by grade point average (GPA) and type of coursework: 1982, 1990, and 1994.

21 Average number of Carnegie units accumulated by public high school graduates in the vocational and specific labor market preparation curricula, by school urbanicity: 1982, 1990, and 1994

22 Percentage of public high school graduates concentrating (accumulating 3 or more
credits) and specializing (accumulating 4 or more credits with 2 or more of those
credits beyond the introductory level) in vocational programs, by selected student and
school characteristics: 1982, 1990, and 1994

23 Percentage of public high school graduates meeting the New Basics core academic $\quad 6$ standards, by curriculum specialization in high school: 1982, 1990, and 1994............. 63
Table Page
24 Percentage distribution of public high school graduates according to curriculum specialization in high school: 1982, 1990, and 1994 ..... 65
25 Average number of credits earned by public high school graduates in English, and the percentage of total English coursework earned in low-level courses (language skills, functional, and basic English), by curriculum specialization in high school: 1982, 1990, and 1994 ..... 66
26 Average number of Carnegie units accumulated by public high school graduates in social studies, by curriculum specialization in high school and type of social studies coursework: 1982, 1990, and 1994 ..... 67
27 Percentage of high school graduates completing coursework in mathematics, by curriculum specialization in high school and type of mathematics coursework: 1982, 1990, and 1994 ..... 68
28 Average number of credits earned by public high school graduates in mathematics, and the percentage of total mathematics coursework earned in below-algebra courses, by curriculum specialization in high school: 1982, 1990, and 1994 ..... 69
29 Average number of credits earned by public high school graduates in science, and the percentage of total science coursework earned at the basic level, by curriculum specialization in high school: 1982, 1990, and 1994 ..... 71
30 Percentage of public high school graduates completing coursework in chemistry and physics, by curriculum specialization in high school: 1982, 1990, and 1994 ..... 72
31 Percentage distribution of 1988 8th graders according to subsequent specialization in vocational education in high school, by 8th-grade composite test score quartiles: 1992 ..... 73
32a Average number of credits earned by 1992 public high school graduates in various English courses and average number and percentage of credits earned in low-level courses, by curriculum specialization in high school ..... 74
32b Average number of credits earned by 1992 public high school graduates in various mathematics courses and average number and percentage of credits earned in low- level courses, by curriculum specialization in high school ..... 74
32c Average number of credits earned by 1992 public high school graduates in science and physics courses, by curriculum specialization in high school ..... 76
33 Average 8-10th, 10-12th, and 8-12th grade test score gains in reading, mathematics, and science for 1992 public high school graduates, by curriculum specialization in high school ..... 76
Table Page
34 Average 8-10th, 10-12th, and 8-12th grade test score gains in mathematics for 1992public high school graduates according to 8th-grade mathematics test score quartiles,by curriculum specialization in high school.77
35 Average 8-10th, 10-12th, and 8-12th grade test score gains in reading for 1992public high school graduates according to 8th-grade reading test score quartiles, bycurriculum specialization in high school78
36 Average 8-10th, 10-12th, and 8-12th grade test score gains in science for 1992 public high school graduates according to 8th-grade science test score quartiles, by curriculum specialization in high school.78
37 Average number of credits earned by 1992 public high school graduates in various mathematics and precalculus courses and average number and percentage of credits earned in low-level mathematics courses according to 8th-grade mathematics test score quartiles, by curriculum specialization in high school80
38 Percentage of public schools reporting various efforts to integrate academic and vocational education, by selected school characteristics: 1997 ..... 82
39 Percentage of public schools offering tech-prep education, by selected characteristics: 1997 ..... 83
40 Percentage of public schools offering various school-based activities, by selected characteristics: 1997 ..... 85
41 Percentage of public schools offering skill standards, skill certificates, and occupational certificates, by selected school characteristics: 1997 ..... 86
42 Percentage distribution of 1992 public high school graduates according to their work status during their senior year in high school, by curriculum specialization in high school ..... 87
43 Percentage of public high school graduates completing cooperative education or work experience coursework in a specific occupational area, by curriculum specialization in high school: 1982, 1990, and 1994 ..... 89
44 Average percentage of specific labor market preparation (SLMP) credits earnedthrough cooperative education or work experience coursework in a specificoccupational area, by curriculum specialization in high school: 1982, 1990,and 19948945 Average number of Carnegie units accumulated by public high school graduates incooperative education and work experience coursework in a specific occupationalarea: 1982, 1990, and 199491
Table Page
46 Percentage of graduates completing career preparation and general work experience courses not in a specific occupational area, by curriculum specialization in high school: 1982, 1990, and 1994 ..... 92
47 Percentage of public high school graduates completing at least . 5 credits of computer education coursework: 1982, 1990, and 1994 ..... 92
48 Percentage of public high school graduates completing introductory technology coursework, by type of course: 1982, 1990, and 1994 ..... 94
49 Percentage distribution of public school teachers of grades 9 through 12 according to highest educational degree, by teaching assignment and vocational program area: 1990-91 and 1993-94 ..... 96
50 Percentage distribution of public school teachers of grades 9 through 12 according to major field of highest degree, by teaching assignment: 1990-91 and 1993-94. ..... 97
51 Percentage distribution of public school teachers of grades 9 through 12 according to years of teaching experience, by teaching assignment: 1990-91 and 1993-94 ..... 98
52 Percentage distribution of public school teachers of grades 9 through 12 according totype of credential in primary assignment field, by teaching assignment: 1990-91 and1993-9498
53 Percentage distribution of public school teachers of grades 9 through 12 according to age in current school year and age when began teaching, by teaching assignment: 1990-91 and 1993-94 ..... 99
54 Percentage distribution of public school teachers of grades 9 through 12 according to sex, by teaching assignment: 1990-91 and 1993-94 ..... 100
55 Percentage distribution of public school teachers of grades 9 through 12 according to race-ethnicity, by teaching assignment: 1990-91 and 1993-94 ..... 101
56 Percentage of public school teachers of grades 9 through 12 who reportedparticipating in various professional development activities, by teaching assignmentand vocational teachers by school type: 1993-94102
57 Percentage of public school teachers of grades 9 through 12 who reported participating in inservice/professional development activities focusing on various topics, by teaching assignment and vocational teachers by school type: 1993-94103
58 Percentage of public school teachers of grades 9 through 12 who agreed with variousstatements about the impact of professional development activities, by teachingassignment: 1993-94104

## Table

59 Percentage of public school teachers of grades 9 through 12 who reported receiving various types of support for inservice/professional development activities, by teaching assignment: 1993-94.

60 Percentage distribution of public school teachers of grades 9 through 12 according to age when began teaching and highest educational degree, by teaching assignment and vocational teachers by school type: 1993-94

61 Percentage distribution of 1982 public high school graduates according to their enrollment status in postsecondary institutions by 1984, by curriculum specialization and hours worked per week in high school

62 Percentage distribution of 1992 public high school graduates according to their enrollment status in postsecondary institutions by 1994, and of those enrolled, percentage distribution according to type of first institution, by curriculum specialization in high school

63 Percentage distribution of 1982 public high school graduates enrolled in postsecondary institutions by 1984 according to type of institution, by curriculum specialization and hours worked per week in high school

64 Percentage distribution of 1992 public high school graduates enrolled in postsecondary education in 1994 according to their employment status and work orientation, by curriculum specialization in high school

65 Percentage distribution of 1992 public high school graduates according to their education and employment status in 1994, by curriculum specialization in high school

66 Percentage distribution of 1992 public high school graduates according to their postsecondary enrollment and attainment status by 1994, by curriculum specialization in high school

67 Percentage distribution of 1982 public high school graduates according to their
postsecondary attainment by 1984, by curriculum specialization and hours worked per
week in high school ..... 118

68 Percentage distribution of 1982 public high school graduates according to their postsecondary enrollment and attainment status by 1992, by curriculum specialization in high school

69 Percentage distribution of 1982 public high school graduates who subsequently enrolled according to the timing of their first postsecondary enrollment, by curriculum specialization in high school 121

## I. Introduction

## VOCATIONAL EDUCATION TOWARD THE YEAR 2000

With the advent of the 21st century, vocational education in the United States is in transition. The traditional focus on preparing students for entry-level jobs after high school or 1 or 2 years of postsecondary training is giving way to a broader purpose-one that includes greater emphasis on academic preparation and provides a wider range of career choices. Vocational Education in the United States: Toward the Year 2000 attempts to capture this evolving enterprise. However, the surveys available for assessing the status of vocational education were generally designed to capture more traditional conceptions of the enterprise and often do not provide information on the most current reform efforts. Nevertheless, the available data do signal that change is occurring in the directions advocated by reform efforts, although such change is often small and preliminary. Because the Carl D. Perkins Vocational and Applied Technology Education Act of 1998 (1998 Perkins Act) generally continues the reforms mandated by its 1990 predecessor rather than changing the course of reform, future data collection may detect greater shifts in the structure, content, and impact of vocational education.

This report is the third in a series published by the National Center for Education Statistics (NCES). The first two reports, Vocational Education in the United States: 1969-1990 and Vocational Education in the United States: The Early 1990s, were published in 1992 and 1995, respectively. Each describes vocational education in America, updating key trends based on available data and focusing on selected issues relevant to current policy discussions. This introduction describes the direction reform has taken in recent years, as well as the current structure of vocational education at both the high school and postsecondary levels.

## The Direction of Reform

Historically, the purpose of vocational education has been to prepare students for entrylevel jobs in occupations requiring less than a baccalaureate degree. Over the last 15 years, however, this purpose has shifted toward broader preparation that develops the academic, vocational, and technical skills of students in vocational education programs. This preparation involves the integration of academic and vocational education, emphasis on all aspects of an industry, and implementation of academic performance measures, among other reform efforts. Vocational
education legislation and policy now also encourage high school students to continue their studies at the postsecondary level, and 2-year postsecondary students to pursue 4 -year credentials through various articulation or "tech-prep" arrangements. This shift in purpose began in the mid1980s, was first passed into law at the federal level in the 1990 Perkins Act, and was confirmed by the recently passed 1998 Perkins Act.

In the mid-1980s, after publication of A Nation at Risk, ${ }^{1}$ some educators and school reformers began advocating for strengthening academic learning and better preparing students for the world of work. They believed this could be accomplished by integrating academic and vocational education and developing tech-prep programs. ${ }^{2}$ Integration was seen as a means to make academic learning more meaningful for all students, to prepare all students more broadly for employment, to improve student engagement and learning, and to improve the academic content of vocational courses, among other objectives. Tech-prep programs that articulate the last 2 years of high school and the first 2 years of postsecondary vocational education programs were designed to help students develop both strong academic and occupational skills and were seen as a way to prepare them for a growing number of technical jobs and for greater flexibility and adaptability in the workplace.

At the federal level, these reforms were first enacted in the 1990 Perkins Act, along with a new requirement for states to develop performance measures and standards-including a measure of academic gains-for assessing local vocational programs. The 1994 School-to-Work Opportunities Act (the STWO Act) later reinforced the call for integration of academic and vocational education and articulation of secondary and postsecondary education; however, the STWO Act advocated these reforms for all students, not just those in vocational education programs. The STWO Act also advocated wider implementation of work-based learning-a common component of traditional vocational education programs-and called for multiple forms of it, including job shadowing, mentoring, internships, and apprenticeships.

The 1998 Perkins Act, which will accompany vocational education into the 21st century, continues the emphasis on integration, secondary-postsecondary articulation, and "all aspects of the industry," and once again requires a measure of academic performance. Furthermore, the new Act strengthens the accountability mechanism of performance measures by linking monetary disincentives to poor performance on them.

[^6]Vocational education is evolving into a multipurpose enterprise that seeks to impart not only occupational skills to students wishing to enter employment directly, but also academic skills deemed to provide students with better preparation for both the world of work and postsecondary education. Consequently, more students will likely have a greater set of options available to them as they choose and invent their careers. Where this evolution will eventually lead is uncertain. That it is evolving is clear.

## Vocational Education at the High School Level

When investigating trends in vocational education at the high school level, two questions should be addressed: How has vocational education traditionally been organized and delivered? and How does one measure participation in vocational education?

## The Organization and Delivery of Vocational Education

Vocational education at the high school level has traditionally consisted of courses in specific labor market preparation (SLMP) (such as agriculture and renewable resources, business, health care, and trade and industry); family and consumer sciences education (FCSE) (formerly called "consumer and homemaking education"); and general labor market preparation (GLMP) (a loose collection of general preparation coursework, including basic keyboarding and typewriting, industrial arts and the newer technology education, and career preparation and general work experience). Figure 1 classifies high school courses according to the taxonomy used for this report, including academic, vocational, enrichment/other, and special education courses. This taxonomy was recently revised by NCES, and changes in the SLMP categories are noted for anyone comparing this report with the previous two Vocational Education in the United States publications. Generally, only minor revisions in course classifications were made, although a few were notable. ${ }^{3}$ For example, the revised taxonomy now includes English as a Second Language courses under English rather than under Non-English (previously Foreign) Languages. Additionally, all computer-related courses are now included under the Vocational curriculum, whereas some were previously included under Mathematics. Because of these and other shifts in the placement of specific courses, there may be small differences between the percentages and average credits published in this report and those published in previous Vocational Education in the United

[^7]

[^8]States publications or other NCES publications, such as the Digest of Education Statistics. However, differences should generally be small. ${ }^{4}$

The program areas listed under the "specific labor market preparation" heading represent broad groupings of related occupational programs. ${ }^{5}$ For example, "agriculture and renewable resources" encompasses programs in agricultural technology and horticulture, among others. The "trade and industry" classification consists of the construction trades, mechanics and repair, precision production, and transportation and material moving; these groupings encompass even narrower programs. Construction trades, for instance, includes specific programs in electricity, carpentry, and plumbing, among others. The categories in figure 1 were constructed for a couple of reasons. First, while some schools offer a sequence of courses in a single narrow occupational area (such as Electricity 1 and Electricity 2), many programs of study involve taking coursework in related occupational areas. For example, both electricity and carpentry programs may recommend that their students take electrical fundamentals, blueprint reading, and customer relations courses in addition to their core technical coursework. Although these courses may be associated with a particular occupational program, they may be available to and form part of the program of study for students in several different occupational programs. Moreover, individual schools may attach specific courses to program areas in varying ways. For example, one school may consider blueprint reading to be part of the electricity program, while another may offer it through its carpentry program. Grouping related courses and programs together avoids misclassifying some courses. The second reason for establishing these broad groupings is that the number of students included in a national educational survey who take courses in any one narrow occupational area is often too small to be reported reliably.

Recent research suggests that schools are beginning to organize occupational education around broader occupational clusters or specific industries. These new initiatives represent attempts to provide students with broader academic and occupational preparation so they have a greater choice of careers and postsecondary paths and can bring a wider array of skills into the work world. Some practices include organizing entire schools around a broad occupational or industry theme (such as aviation, fashion, or finance); these schools are sometimes called "magnet" or "theme schools." Other practices include creating one or more schools-within-a-school that have occupational or career-related themes (such as health science, business and finance, natural resources, graphic arts, communications, or technology). These career academies or "houses" may be designed for either at-risk or academically talented students, or for a

[^9]heterogeneous mix of students. Still other practices involve grouping occupational programs into clusters, majors, or pathways. The current taxonomy of high school courses and the reliance of NCES on transcript data for obtaining reliable information on students' course-taking patterns are generally not able to capture these school-level phenomena. Instead, a survey of school administrators included in this report provides some information on the prevalence of these activities. ${ }^{6}$

These reforms aside, vocational education has usually been offered in three main public high school settings. ${ }^{7}$ Comprehensive high schools—the traditional American high school—typically offer the full range of academic and vocational education, including FCSE, GLMP, and SLMP coursework, although the latter offerings may be limited depending on the school. In addition to comprehensive high schools, some states have area vocational schools, usually offering a wide range of occupational programs, that students attend for part of the day to take their occupational coursework. Where area vocational schools exist, the comprehensive "sending" high school may restrict its vocational offerings to FCSE and GLMP courses. Finally, a few states have full-time vocational high schools that provide students with all of their academic preparation, as well as offer a variety of occupational programs. Such high schools may or may not be organized around occupational or industry themes or function as magnet or theme schools; they differ from comprehensive high schools in that students are generally required to select and complete an occupational program or major. Some of the surveys used for this report are able to identify comprehensive high schools and vocational schools but are unable to distinguish between area vocational schools and full-time vocational high schools. ${ }^{8}$

## Measuring Participation in Vocational Education

Except in traditional full-time vocational high schools where graduates are typically required to complete a vocational program of study, most high school students are free to take as much and as varied vocational coursework as they want. Some states have traditionally required that students complete a small number of vocational courses (usually one or two semester-long courses) to graduate. However, the vast majority of public high school graduates take more than 1.0 Carnegie unit of vocational education, and more than half take the equivalent of three or

[^10]more year-long courses. ${ }^{9}$ Moreover, students may take a sequence of related occupational courses, may dabble in different occupational program areas, or may take no specific occupational coursework whatsoever. This report documents the different patterns of participation in vocational education found in public high schools and the trends in such participation over time.

Almost all public high school students take vocational courses. In 1994, 97 percent of public high school students took at least one vocational education course, and 91 percent completed at least one specific occupational course (table 1). However, it can be useful to identify the subset of high school students who complete a sequence of related occupational courses for several reasons. Examining this pattern of participation helps determine whether schools are preparing students adequately for the world of work. It also provides one indication of the size of the vocational enterprise and whether it is growing or shrinking. Completing a sequence of related occupational courses can be examined in conjunction with completing a college preparatory curriculum. That is, to what extent do students complete both courses of study or neither, and what are the trends over time? Additionally, identifying different curriculum pathways makes it possible to examine the outcomes associated with these pathways, such as achievement in high school and subsequent postsecondary and labor market participation.

Table 1—Percentage of public high school graduates completing one or more courses in vocational education, by type of vocational education: 1982-94

| Vocational education type | 1982 | 1990 | 1994 |
| :--- | :---: | :---: | :---: |
| Total | 98.2 | 98.0 | 97.2 |
|  |  |  |  |
| Family and consumer sciences education | 50.2 | 48.1 | 45.1 |
| General labor market preparation | 77.6 | 68.8 | 61.1 |
| Specific labor market preparation | 88.7 | 90.6 | 90.8 |

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

Nonetheless, deciding on appropriate criteria for what constitutes completion of a sequence of related occupational courses is somewhat arbitrary. States and individual high schools have varying definitions of "vocational completion." However, to facilitate our analysis, two definitions were used in this study. The report defines "vocational concentrators" as those public high

[^11]school graduates who completed 3.0 or more Carnegie units in a single occupational program area, as indicated by the major headings under the "specific labor market preparation" classification in figure 1. A more restrictive definition of "vocational specialization" was defined as completing 4.0 or more Carnegie units in one of these occupational areas, with 2.0 or more of the units taken beyond the introductory level. Because a number of states count students as "vocational completers" if they take 3.0 or more vocational credits, generally the focus here is on the less restrictive definition.

## Vocational Education at the Postsecondary Level

Some of the issues facing vocational education at the postsecondary level are similar to those at the high school level, and others are unique.

## The Organization and Delivery of Vocational Education

Federal legislation historically defines vocational education as leading to less than a bachelor's degree. Vocational education at the postsecondary level, therefore, covers associate's degree and subbaccalaureate certificate programs. Both 4-year and less-than-4-year postsecondary institutions offer subbaccalaureate vocational programs. Unlike at the high school level, postsecondary vocational education is commonly offered in both the public and private sectors. In all, six main types of postsecondary institutions offer vocational education programs and are included in this report:

- public 4-year institutions
- public 2-year institutions (sometimes referred to as "community colleges")
- public less-than-2-year institutions (sometimes referred to as "vocational-technical institutes")
- private, not-for-profit 4-year institutions
- private, not-for-profit 2-year institutions (which includes all private, not-for-profit less-than-4-year institutions)
- private, for-profit institutions

The designation "4-year" means that the institution awards bachelor's or graduate degrees as its highest degree type. The designation " 2 -year" means the institution awards associate's
degrees or less-than-4-year, subbaccalaureate certificates as its highest award type. The designation "less-than-2-year" means that the institution does not award degrees but awards subbaccalaureate certificates of less than 2 years in length. Private, for-profit institutions usually offer certificates but may offer other degrees as well.

Figure 2 presents the taxonomy used in this report to classify subbaccalaureate postsecondary majors as either academic or vocational. ${ }^{10}$ Some institutions that offer subbaccalaureate programs explicitly identify their programs as either academic or vocational. In some cases, different degrees are awarded, for example, Associate of Arts (A.A.) degrees for completing academic programs and Associate of Science (A.S.) degrees for completing vocational programs. Other institutions do not make this distinction. The taxonomy in figure 2 provides a uniform standard for classifying majors as either academic or vocational that is independent of institutional differences. ${ }^{11}$

Most of the reforms advocated for high school vocational education have also been advocated for postsecondary vocational education. These include integration of academic and vocational education, tech prep, work-based learning, and performance measures.

## Measuring Participation in Vocational Education

As at the high school level, postsecondary students participate in vocational education to varying degrees and with different intentions. Certain students enter postsecondary institutions with a specific course of study in mind. In some cases, students must apply and be accepted to a vocational program or otherwise formally enroll. For example, associate's degree nursing programs are often in such great demand that they require formal admission. Some shorter-term vocational certificate programs with a set course of study that students pursue as a cohort also require formal enrollment. In many cases, however, postsecondary students are responsible for their own course enrollment and select from a broad range of academic and vocational courses each semester. Students who have clear degree intentions may follow the recommended course of study for a program that is laid out in the institution's course catalog. However, many students may explore different types of coursework before settling on a "major." Others may enroll for credit but do not have clear intentions of completing a degree or certificate program. Still others may have specific short-term goals for obtaining new skills that do not involve certificate or

[^12]FIGURE 2-CLASSIFICATION OF ACADEMIC AND VOCATIONAL MAJORS FOR SUBBACCALAUREATE POSTSECONDARY PROGRAMS

Academic Majors

[^13] Education, March 1992).
degree completion. Most of the postsecondary data included in this report were derived from surveys of students enrolled for credit in postsecondary institutions.

If postsecondary transcript data were available, it would be interesting to explore the different paths and combinations of coursework that subbaccalaureate students take. However, no such recent data are available. ${ }^{12}$ Instead, this publication relies on self-reported degree intentions and major fields to identify subbaccalaureate students and classify them by their reported majors as either academic or vocational (or not reported). For this reason, the postsecondary analysis in this report is less extensive and detailed than the high school analysis, which had access to course enrollment data contained in high school transcripts. Additionally, comparable data were generally available beginning in 1990, shortening the timeframe over which postsecondary trends could be analyzed. ${ }^{13}$

## Content and Structure of the Report

Policymakers and vocational educators need information about the status and direction of vocational education in the United States. To respond to these information needs, this report addresses the following questions:

- What are the major national economic and labor market trends and their implications for vocational education programs and policies?
- What skills do employers value, and how have skill requirements and worker proficiency changed in recent years?
- How large is the vocational education enterprise at both the secondary and postsecondary levels, and is it growing, shrinking, or holding constant over time?
- What types of vocational education do students take at each level, and how much do they take?
- Who participates in vocational education, and is this changing?

[^14]- Is the academic preparation of students who participate in vocational education improving over time?
- What is the role of work experience and work-based learning in students' courses of study?
- To what extent have recent vocational education reform efforts taken hold at the local level?
- What are the postsecondary and labor market outcomes associated with participation in vocational education?
- What are the trends in vocational teacher qualifications and experience over time?
- In what types of professional development do vocational teachers participate?

## Sources of Information

To address the above questions, the authors analyzed data from nine separate national surveys sponsored by one of three federal statistical agencies: NCES, the Bureau of Labor Statistics (BLS), and the Census Bureau. The surveys were administered to representative samples of students, teachers, adults in the general population, schools, and/or employers. The following is a list of the databases analyzed for each section of the report:

## Employer Perspectives

- First and Second National Employer Surveys ${ }^{14}$ (describing private, for-profit employers with 20 or more employees in 1994 and 1997)

## Trends in Secondary Vocational Education

- High School and Beyond Sophomore Cohort Surveys and High School Transcript Study (describing 1982 high school graduates)
- High School Transcript Studies of 1990 and 1994 (describing 1990 and 1994 high school graduates)

[^15]- National Education Longitudinal Study of 1988 Surveys, Assessment File, and High School Transcript Study (describing 1992 high school graduates)
- National Longitudinal Study of Youth-1997 (describing schools with a 12th grade) ${ }^{15}$
- Schools and Staffing Surveys of 1991 and 1994 (describing high school teachers)

## Transitions After High School

- High School and Beyond Third and Fourth Follow-up Surveys (describing outcomes for 1982 high school graduates, 2 and 10 years after graduation)
- National Education Longitudinal Study of 1988 Third Follow-up Survey (describing outcomes for 1992 high school graduates, 2 years after graduation)

## Trends in Postsecondary Vocational Education

- Current Population Surveys of 1990, 1991, 1994, and 1996, October supplements (describing adults in the general U.S. population)
- National Postsecondary Student Aid Studies of 1990 and 1996 (describing students enrolled for credit in postsecondary institutions)
- Beginning Postsecondary Students Longitudinal Study of 1990, Base Year through Second Follow-up (describing outcomes for students who began their postsecondary education for the first time in 1989-90, 4 years later in 1994)

The data sets and the analytic methods used in this report are described in detail in appendix B.

[^16]
## THIS PAGE INTENTIONALLY LEFT BLANK

## II. The Context

The trends toward a service- and information-based economy in recent decades have two important implications for vocational education programs. These trends signal an ongoing shift in the education and training fields that are required of the U.S. work force as well as the levels of that education and training. In order to prepare students for the industries and occupations of the 21 st century, it is crucial for vocational educators and policymakers to understand the transitions taking place. This chapter summarizes the current literature on economic and labor market trends and provides a context for understanding the data in the following chapters.

## ECONOMIC TRENDS

## Defining Key Terms

A clear discussion of the trend toward a service-based economy demands that key terms be defined. Confusion can arise because the terms "service-producing industries," the "services industry," "service-producing occupations," and "service occupations" refer to four distinct but overlapping phenomena. Figure 3 illustrates the relationships among several of these concepts. At the most fundamental level, industrial classification systems typically divide employment into two main sectors: service-producing and goods-producing industries. Service-producing industries encompass transportation, communications, and public utilities; wholesale and retail trade; finance, insurance, and real estate; government; and "services." Goods-producing industries encompass agriculture, mining, construction, and manufacturing. ${ }^{16}$ At times, economists compare the service-producing industries and goods-producing industries. At other times, they compare two major industry groups within these broad sectors: the services industry and the manufacturing industry. In 1997, the broader "service-producing industries" classification covered 74.4 percent of total employment in the U.S.; the narrower "services industry" classification covered 35.8 percent of total employment (figure 3 and table 2a).

The services industry includes a broad variety of activities, such as health care, advertising, computer and data processing services, personnel supply, private education, social services, legal

[^17]Figure 3-Percentage distribution of total employment, by sector and type of industry, and percentage distribution of service-producing occupations by sector and type of industry: 1997

SOURCE: (Derived from tables 2a and 2b.) U.S. Department of Commerce, Bureau of the Census, Current Population Survey, 1997, unpublished data.
services, management and public relations, engineering and architectural services, accounting, and recreation. The services industry includes establishments as diverse as Microsoft ${ }^{\mathrm{TM}}$ and 24 Hour Fitness. ${ }^{\text {TM }}$ The manufacturing industry encompasses both durable and nondurable goods production.

To complicate matters further, "service-producing occupations" and "service occupations" do not overlap neatly with either of the industrial classifications. Service-producing occupations encompass managerial and professional specialty occupations, technicians and related support, sales and administrative support (including clerical), and "service occupations." The narrower

Table 2a-Column percentage distribution of U.S. workers employed in service-producing and goodsproducing occupations according to industry: 1997

| Industry | 1997 Occupational classification |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  | Total | Managerial and professional specialty | Tech- <br> nicians <br> and <br> related <br> support | Sales and administrative support, including clerical | Service | Total | Precison production, craft, repair, operators, fabricators, and laborers | Farming, forestry, and fishing |
| Total all industries | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |
| Goods-producing industries | 25.6 | 12.1 | 17.5 | 19.2 | 10.5 | 1.9 | 60.7 | 58.2 | 84.0 |
| Agriculture | 2.6 | 0.5 | 0.5 | 1.1 | 0.5 | 0.1 | 8.2 | 0.4 | 80.6 |
| Mining | 0.5 | 0.3 | 0.4 | 0.6 | 0.2 | 0.0 | 1.1 | 1.2 | 0.0 |
| Construction | 6.4 | 2.1 | 3.8 | 1.1 | 1.5 | 0.2 | 17.5 | 19.3 | 0.6 |
| Manufacturing | 16.1 | 9.2 | 12.8 | 16.4 | 8.3 | 1.5 | 34.0 | 37.4 | 2.7 |
| Service-producing industries | 74.4 | 87.9 | 82.5 | 80.8 | 89.5 | 98.1 | 39.3 | 41.6 | 16.0 |
| Transportation and public utilities | 7.1 | 5.4 | 4.8 | 8.1 | 7.6 | 1.7 | 11.6 | 12.8 | 0.5 |
| Wholesale and retail trade | 20.7 | 23.3 | 8.0 | 4.8 | 39.5 | 29.1 | 13.9 | 15.1 | 2.9 |
| Finance, insurance, and real estate | 6.4 | 8.6 | 7.3 | 3.6 | 14.2 | 1.8 | 0.7 | 0.7 | 1.1 |
| Services, except professional | 11.9 | 13.0 | 11.7 | 9.0 | 8.6 | 25.2 | 9.2 | 9.3 | 8.3 |
| Professional services | 23.9 | 31.9 | 44.9 | 50.1 | 15.8 | 31.0 | 3.0 | 3.1 | 2.7 |
| Public administration | 4.4 | 5.8 | 5.9 | 5.2 | 3.9 | 9.4 | 0.9 | 0.9 | 0.7 |

NOTE: Percentages may not add to 100 due to rounding. Estimates appearing as 0.0 may be nonzero but less than 0.05 .
SOURCE: U.S. Department of Commerce, Bureau of the Census, Current Population Survey, 1997, unpublished data.
service occupations category covers, for example, janitors and cleaners, food preparation workers, waiters and waitresses, nursing aides and orderlies, home health aides, correction officers, and guards. Thus, service-producing occupations include managers in agribusiness companies and computer technicians in high-technology firms, as well as service occupations such as McDonalds ${ }^{\text {,TM }}$ cooks and janitors at General Motors. ${ }^{\text {TM }}$

In 1997, the broader "service-producing occupations" classification covered 72.2 percent of total employment in the U.S.; the narrower "service occupations" classification covered 13.5 percent of total employment (table 2b). Although most service-producing occupations occur in service-producing industries, 12.1 percent of these occupations occur in goods-producing industries (figure 3 and tables 2 a ). In contrast, the vast majority of service occupations ( 98.1 percent) occur in service-producing industries, although just 56.2 percent occur in the services industry (table 2a).

Table 2b—Row percentage distribution of U.S. workers employed in service-producing and goods-producing industries according to occupation: 1997

| Industry | 1997 Occupational classification |  |  |  |  |  |  |  |  |

## Ascendance of Services

At the beginning of the 20th century, the U.S. economy was in the midst of a massive transition, one that involved workers moving from agriculture into industry. At the end of the 20th century, the economy is again in a state of flux, with more and more workers finding employment in the services industry as opposed to manufacturing. In 1945, the services industry accounted for 10 percent of nonfarm employment, compared with 38 percent for manufacturing. By 1996, services accounted for 29 percent of nonfarm employment, while manufacturing declined to 15 percent. ${ }^{17}$ These trends are expected to continue into the 21 st century. The Bureau of Labor

[^18]Statistics projects that the service-producing sector will create virtually all of the new jobs between 1996 and 2006, with almost two-thirds of these jobs in the services industry. ${ }^{18}$

Some have argued that services industry jobs are not as good as manufacturing jobs and that the trend toward services is therefore worrisome for the American worker. ${ }^{19}$ However, research shows that the services industry is very diverse and that the shift from manufacturing to services does not necessarily signal a deterioration in overall job quality. ${ }^{20}$ In 1996, average hourly earnings for workers in the services industry was $\$ 11.79$-about 92 percent of the $\$ 12.78$ average for manufacturing workers. The wage differential between these two industries had narrowed considerably since 1964, when average hourly earnings in services were 77 percent of the manufacturing average. ${ }^{21}$ In 1996, the distribution, or spread, of earnings was similar for the two industries, so that one could not simply be labeled "low wage" and the other "high wage." A comprehensive assessment of job quality that examined employee benefits, job security, occupational structure, and occupational safety, in addition to average wages, found that the services industry was very diverse in terms of job quality and that many service jobs compared favorably with those in manufacturing. ${ }^{22}$

The types of employment covered under service-related classifications is very broad. Serv-ice-producing occupations cover anyone from filing clerks to chief executive officers, and serv-ice-producing industries cover anything from fast-food restaurants to corporate banks. Consequently, the shift to a service-based economy describes a complex process that encompasses both low- and high-wage jobs, requires varying skill levels, and presents a broad range of employment opportunities.

## The Emerging Information Economy

What accounts for the decline of manufacturing and the movement toward a service-based economy? The decline of manufacturing is often referred to as "economic restructuring," a term that encompasses technological change and new competitive pressures on firms. Assessing the impact of economic restructuring, though, is not a simple matter and is subject to much debate in the economic literature and the popular press. The work of Paul Krugman, Jeffrey Sachs, Howard

[^19]Shatz, and Gary Burtless contradicts the prevalent assumption that international trade is the main cause of widespread changes in the manufacturing sector during the past 30 years. ${ }^{23}$

There is more consensus about the role that technology has played in the growth of the service sector. The U.S. economy is in the midst of what Alan Greenspan calls a "once-in-acentury event," a "structural technological advance" in information technology that is changing the shape of the economy and the nature of work. ${ }^{24} \mathrm{He}$ argues that development of the transistor and integrated circuit and the resulting explosion of advancements in the computing and telecommunications technologies have fundamentally changed the structure of the American economy. Much like the industrial revolution, which caused people to move from working in the fields to working in factories, advances in information technology are causing employment to shift from factories to service-producing firms.

As a result, major industrialized economies are becoming "knowledge-based," where the creation, distribution, and use of information and knowledge-including both technology and human capital—are becoming increasingly important. According to some calculations, more than half of the total gross domestic product in the major industrialized economies is now knowledgebased, including industries such as telecommunications, computers, software, pharmaceuticals, education, and television. ${ }^{25}$ High-technology industries have almost doubled their share of manufacturing output over the past two decades to around 25 percent, and knowledge-intensive services are growing even faster. ${ }^{26}$ By one reckoning, "knowledge workers," from brain surgeons to journalists, account for 8 out of every 10 new jobs. ${ }^{27}$

[^20]
## LABOR MARKET TRENDS

Against the backdrop of the shift toward a service- and information-based economy, this section describes occupational trends and changing education and skill requirements.

## Occupational Trends

In order to understand occupational trends clearly, it is important to draw the distinction between "fast-growing occupations" and those with "large job growth." A fast-growing occupa-tion-one, for example, that doubles the number of jobs over a 10-year period—may add only a small absolute number of jobs to the economy. In contrast, a slow-growing occupation, one that increases only 10 or 20 percent over a 10 -year period, may add a large absolute number of jobs, because it began with a much larger employment base. Fast-growing occupations may receive a lot of attention because they represent "emerging" occupations and, possibly, are the wave of the future. However, it is important to consider the contribution of occupations with large job growth as well as these fast-growing occupations, in order to have a complete employment picture.

The Department of Labor's Bureau of Labor Statistics (BLS) periodically publishes employment outlooks that make projections about the fastest-growing occupations and those with the largest job growth. A recent report, published in November 1997, makes projections for the period from 1996 to $2006 .{ }^{28}$

Among the major occupational groups, employment in professional specialty occupations is projected to increase the fastest and add the most jobs between 1996 and 2006 (table 3). The group with the second fastest growth rate is projected to be technicians and related support occupations, although this group is small and is not expected to add a large number of jobs. The next fastest growing group is service occupations, which together with professional specialty occupations are projected to add nearly half of all new jobs from 1996 and 2006.

Among detailed occupations, the 10 occupations with the highest projected growth rates are all service-producing occupations, and they can be classified in either the computer technology or health fields (table 4a). Between 1996 and 2006, these occupations are projected to grow from 69 to 117 percent, while the average growth rate for all occupations is projected to be 14 percent over the same period. However, these fastest growing occupations are projected to make up 3 percent of all jobs by the year 2006.

[^21]Table 3-Employment by major occupational group: 1996 and projected 2006

| $\underline{\text { Occupational group }}$ | Employment |  | Change |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 1996 <br> (in thousands <br> of jobs) | 2006 (in thousands of jobs) | Number (in thousands of jobs) | Percent |
| All occupations | 132,353 | 150,927 | 18,574 | 14.0 |
| Executive, administrative, and managerial | 13,542 | 15,866 | 2,324 | 17.2 |
| Professional specialty | 18,173 | 22,998 | 4,826 | 26.6 |
| Technicians and related support | 4,618 | 5,558 | 940 | 20.4 |
| Marketing and sales | 14,633 | 16,897 | 2,264 | 15.5 |
| Administrative support, including clerical | 24,019 | 25,825 | 1,806 | 7.5 |

The 10 detailed occupations with the largest projected increases in number of jobs are somewhat more varied, although they also include several health occupations (table 4b). These occupations are projected to make up 16 percent of total employment by 2006. Only systems analysts and home health aides are included on both lists. Nine of the 10 occupations with the largest projected numeric increases will grow at average or above-average rates. The retail sales occupation, projected to grow at a 10 percent rate, is expected to add more jobs than all but one of the fastest-growing occupations listed in table $4 \mathrm{a} .{ }^{29}$

Table 4b—Employment in the 10 occupations with largest projected job growth: 1996 and projected 2006

| Occupations | Employment |  | Change |  | Quartile rank <br> by 1996 <br> median weekly earnings of fulltime workers | Education and training category |

[^22]
## Changing Education and Skill Requirements

Workforce 2000 estimated that more than half of new jobs between 1984 and 2000 would require some education beyond high school, and one-third would require a bachelor's degree or more. ${ }^{30}$ More recent projections anticipate that average growth will be greater for occupations requiring at least an associate's degree than for occupations requiring less education. ${ }^{31}$ Indeed, the 10 occupations with the highest projected growth rates in table 4 a have relatively high education and training requirements ( 8 require bachelor's degrees or moderate- to long-term on-the-job training). In contrast, however, the 10 occupations with the highest projected increases in number of jobs have relatively low education and training requirements ( 7 require no more than shortterm on-the-job training) (table 4b). While some emerging occupations require high education and training requirements, the majority of jobs still demand relatively low education and training levels. In 1996, 39 percent of all jobs required no more than short-term on-the-job training (table 5).

Table 5—Employment and median weekly earnings by education and training category: 1996

|  | Employment |  |  |
| :--- | ---: | ---: | ---: |
| Education and training category | Number <br> (in thousands <br> of jobs) | Percentage <br> distribution | Median <br> weekly earnings, <br> full-time workers |

[^23]Some changes in business practices are demanding greater skills of workers. Increased global competition since World War II has spurred some U.S. businesses to create "highperformance workplaces," relying on flexible and decentralized work practices and multiskilled workers. Although a growing number of firms are adopting high-performance characteristics, some claim this trend will probably affect only a small number of firms clustered in a few industrial sectors. ${ }^{32}$ To the extent that new business practices are adopted, there may be some increase in the required skills of front-line workers. Some have argued that front-line production workers will need to be proficient at using a range of machines and will need to demonstrate increased flexibility, problem-solving, responsibility, teamwork, initiative, and care and attention, especially in monitoring automated equipment. ${ }^{33}$

Some have also argued that the shift to a service-based economy increases the need for critical-thinking and social skills. For example, jobs that require direct contact with customers and clients require problem solving, responsibility, and social skills. ${ }^{34}$ Additionally, while customer service occupations (such as cooks, nursing aides, secretaries, clerical workers, and cashiers) may require only modest technical skill levels, workers in these occupations are expected to possess social, communication, problem-solving, and basic academic skills. ${ }^{35}$

Generally, research has shown that obtaining workers with a good work ethic and appropriate social behavior has been a priority for employers. Employers complain about the attitude and character of workers-particularly about absenteeism, an inability to adapt, a lack of discipline, and negative work behaviors. ${ }^{36}$ In response to criticisms about the general employability of the work force, the Secretary's Commission on Achieving Necessary Skills (SCANS) identified a range of skills that all work force participants should have. ${ }^{37}$ These include the following:

## Basic Skills

Reading
Writing
Arithmetic
Mathematics

[^24]Listening
Speaking
Thinking Skills
Creative Thinking
Decision Making
Problem Solving
Seeing Things in the Mind's Eye
Knowing How to Learn
Reasoning

## Personal Qualities

## Responsibility

Self-Esteem
Sociability
Self-Management
Integrity/Honesty

In summary, the preponderance of the research evidence argues that there are trends toward greater education and training requirements and a greater need for critical-thinking skills, personal responsibility, and social skills among work force participants. However, these trends are not uniform across industries and occupations, and some disagree about their magnitude.

## Returns to Education and Training

Research has consistently documented positive labor market returns to increasing educational attainment. For example, both rates of employment and labor force participation rise with educational attainment. In 1996, 39 percent of adults who had not completed high school were employed, while 70 percent of those with at least some college (including those with postsecondary vocational certificates) were employed (table 6). Similarly, more than half ( 56 percent) of people lacking a high school education were not in the labor force, compared with 27 percent of those with at least some college education. The unemployment rate of those who had not completed high school was twice that of adults with some college education ( 10 percent versus 4 percent, among labor force participants). Additionally, in 1996, median weekly earnings for fulltime workers generally increased as the education and training requirements of an occupation increased (table 5). For example, while workers in jobs requiring no more than short-term on-thejob training earned $\$ 337$ per week, on average, those with an associate's degree earned almost twice as much (\$639).

Table 6-Percentage distribution of all adults aged 18 years or older and of those in the labor force according to their employment status, by educational attainment: 1996

| Educational attainment | Of all adults |  |  | Adults in labor force |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Employed | Unemployed | $\begin{gathered} \text { Not in labor } \\ \text { force } \\ \hline \end{gathered}$ | Employed | Unemployed |
| Total | 65.1 | 3.2 | 31.8 | 95.3 | 4.7 |
| Less than high school completion | 39.4 | 4.4 | 56.2 | 90.0 | 10.0 |
| High school completion | 63.7 | 3.7 | 32.6 | 94.5 | 5.5 |
| Some college, no degree | 69.7 | 3.0 | 27.3 | 95.9 | 4.2 |
| Associate's degree | 77.5 | 2.6 | 20.0 | 96.8 | 3.2 |
| Bachelor's degree or higher | 79.6 | 1.7 | 18.7 | 97.9 | 2.1 |

NOTE: Percentages may not add to 100 due to rounding.
SOURCE: U.S. Department of Commerce, Bureau of the Census, October Current Population Survey, 1996.

While there is a consistent and strong association between education and training and labor market success, to some extent, these greater returns may be due to "selection bias." That is, persons attaining higher levels of education may be different from those with lower educational attainment in ways-exclusive of education-that affect labor market success. If this is true, then the impact of obtaining more education and training on success in the labor market, in itself, may be overstated. However, recent increases in income disparities between those with more and less education suggest that there are, in fact, direct returns to education and training.

The trend away from a manufacturing-based economy toward a services-based one has been positive for many individuals and industries. ${ }^{38}$ This is not to say, however, that recent changes have benefited everyone. Those without the appropriate education and skills to meet the demands of an increasingly competitive and technical marketplace have watched their wages stagnate and decline over the past 20 years. The rise of information technologies has contributed to the widening inequality in income. Disparities between the more and less educated have increased, and individuals whose work involves less conceptual activities have had either stagnant or falling real income over the past two decades. Table 7 and figure 4 illustrate that income inequality has widened over the period from 1970 to 1995 between holders of high school diplomas and those who have earned bachelor's degrees or higher.

[^25]Table 7—Ratio* of median annual earnings of wage and salary workers aged 25-34 whose highest education level was a bachelor's degree or higher to those with a high school diploma, by sex: Selected years 1970-95

| Year | Male | Female |
| :--- | :--- | :--- |
|  |  |  |
| 1970 | 1.24 | 1.68 |
| 1972 | 1.19 | 1.63 |
| 1974 | 1.14 | 1.74 |
| 1976 | 1.19 | 1.58 |
| 1978 | 1.18 | 1.55 |
| 1980 | 1.19 | 1.52 |
| 1982 | 1.34 | 1.63 |
| 1984 | 1.36 | 1.61 |
| 1986 | 1.50 | 1.78 |
| 1988 | 1.42 | 1.81 |
| 1990 | 1.48 | 1.92 |
| 1991 | 1.53 | 1.90 |
| 1992 | 1.60 | 2.00 |
| 1993 | 1.57 | 1.99 |
| 1994 | 1.52 | 1.86 |
| 1995 | 1.52 | 1.91 |

*This ratio is most useful when compared to 1.0. For example, the ratio of 1.52 in 1995 means that males whose highest education level was a bachelor's degree or higher earned 52 percent more than males who had a high school diploma.
SOURCE: U.S. Department of Commerce, Bureau of the Census, March Current Population Surveys.

Figure 4—Ratio* of median annual earnings of wage and salary workers aged 25-34 with a bachelor's degree or higher to those with a high school diploma, by sex: Selected years 1970-95

*This ratio is most useful when compared to 1.0. For example, the ratio of 1.52 in 1995 means that males whose highest education level was a bachelor's degree or higher earned 52 percent more than males who had a high school diploma.

SOURCE: U.S. Department of Commerce, Bureau of the Census, March Current Population Surveys.

The reported benefits of higher educational attainment are consistent with recent vocational education reforms emphasizing greater academic preparation and further education and training. Research has also shown the following positive employment and earnings outcomes for participants in vocational education: ${ }^{39}$

1) High school students who concentrate their coursework in a vocational field of study have been shown to have better employment and earnings outcomes than those who take fewer than 2.0 credits in a single vocational field;
2) Vocational completers who obtain a job in an occupation that matches their vocational field of study have been shown to outperform their peers who obtain employment in an unrelated field;
3) Female high school students who complete coursework in the business and health fields have been shown to have better outcomes than those who train in other fields. Similarly, both male and female postsecondary students who complete coursework in the health and technical fields have been shown to have better outcomes than those who train in other vocational fields;
4) Students who pursue their vocational studies at a community college have been shown to have better outcomes than students attending other types of postsecondary institutions; and
5) Postsecondary students who complete a vocational program and obtain a degree or certificate have been shown to have better outcomes than those who do not complete or obtain certification.

Participating in vocational education has also been shown to have particular economic benefits for women in general and students with disabilities.

## KEY FINDINGS

The following presents a summary of key findings based on the discussion in this chapter:

- The United States is shifting from a manufacturing- to a service- and information-based economy. These trends have two important implications for vocational education programs. They signal an ongoing shift in the education and training fields that are required of the U.S. work force as well as the levels of that education and training.

[^26]- The occupations with the highest projected growth rates are generally in the computer technology and health fields. Those with the highest projected increase in number of jobs are somewhat more varied, although they also include several health occupations.
- While the occupations with the highest projected growth rates have relatively high education and training requirements, those with the highest projected increase in number of jobs have relatively low education and training requirements. Some emerging occupations require high education and training requirements, while the majority of jobs still demand relatively low education and training levels.
- There is consensus in the research literature that there are trends toward greater education and training requirements and a greater need for critical thinking, personal responsibility, and social skills among work force participants. However, these trends are not uniform across industries and occupations, and some disagree about their magnitude.
- Although researchers have long identified the association between increased educational attainment and better labor market outcomes, the disparity in incomes between those with more and less education has increased in recent years. Some argue that this means that education and training are increasingly crucial for narrowing the income gap and for preventing the creation of a society of haves and have nots.
- Research has shown that positive employment and earnings outcomes accrue to participants in vocational education who concentrate their coursework in a vocational field of study in high school, who complete a postsecondary vocational program and obtain a certificate or degree, and who obtain a job in a field related to their vocational education.

## IMPLICATIONS FOR DATA ANALYSIS

How might the economic and labor market trends in this chapter be reflected in employer, education, and labor market data? The following is a list of questions to guide readers as they examine the data in the following chapters:

- What skills do employers value and how have skill requirements changed in recent years? Are employers implementing high-performance workplaces?
- What are the trends in specific occupational preparation at the high school and postsecondary levels? Specifically, is there a shift from participation in traditional manufacturing programs (such as trade and industrial programs) toward service-sector and information-age programs (such as health and technology and communications programs)?
- Are high school students enrolling in courses that teach technological skills?
- Are students who participate in high school vocational education more academically prepared than in the past, for either the world of work or postsecondary education?
- Are more students in secondary vocational education programs enrolling in and completing postsecondary education than in the past? Are more adults obtaining postsecondary vocational education credentials than before?
- What are the labor market outcomes for persons concentrating in vocational education programs? How do these outcomes compare with other kinds of preparation?

## III. Employer Perspectives

## OVERVIEW

This chapter examines how workplaces are changing and how employers view current and prospective employees. The analysis relies on the 1994 and 1997 National Employer Surveys, which gathered data from a random sample of private firms with 20 or more employees. Public and not-for-profit institutions, firms with fewer than 20 employees, and corporate headquarters were not surveyed. ${ }^{40,41}$ Additional information on the surveys is provided in appendix B.

Key questions about workplace practices examined in this chapter include the following:

- To what extent are firms becoming "high-performance workplaces"?
- What percentage of firms are participating in school-to-work partnerships?
- What forms does this participation take?

The extent to which firms are becoming "high-performance workplaces" may affect the types of skills demanded of employees. Because "high-performance workplaces" are typically decentralized, they demand flexibility and multiple skills from workers. Additionally, employees need to have good critical-thinking and problem-solving skills, and since they often work in teams, good communication and social skills are also necessary. The National Employer Surveys also asked about employer participation in school-to-work partnerships. These data provide one indication of the extent to which the integration of school- and work-based learning is occurring at the local level.

In this chapter, a number of key questions about employer perspectives on employees are addressed, including the following:

[^27]- What do employers look for in front-line workers? Is educational attainment important to employers?
- What percentage of front-line workers have postsecondary education?
- Have skill requirements and worker proficiency changed in recent years?
- How do new hires with work experience (such as cooperative education, internships, or apprenticeships) compare with other new hires?

These questions provide a counterpoint to what the research literature says about changing skill requirements. While the general labor market trend may be toward higher education and training requirements, employers have a unique perspective, which is particularly important in the short term. The National Employer Surveys also allow one to examine from the employer point of view whether previous work experience affects performance on the job, particularly for new hires. These findings have important implications for the current emphasis on providing workbased learning experiences to students.

## WORKPLACE PRACTICES

## High-Performance Workplaces

There is evidence that some employers are transforming their firms into high-performance workplaces, with larger firms being more likely than smaller firms to undergo certain changes. These firms, however, are still in the minority. Both good critical-thinking and social skills are necessary in the decentralized and team-based environment of the high-performance workplace. However, the extent to which these practices will be implemented and these skills be required in the future is uncertain.

- Between 20 and 25 percent of surveyed employers reported some form of highperformance work characteristic in 1997 (table 8). Twenty percent reported performance benchmarking, and one-quarter had recently undergone reengineering. Larger firms were more likely to participate in these activities. On average, about one in five nonsupervisory employees participated in job rotation in 1997, and about 16 percent of nonsupervisory employees worked in self-managed teams.

Table 8-Percentage of employers reporting selected high-performance work characteristics, by firm size: 1994 and 1997

| Firm size (number of employees) | Percentage of employers who |  |  | Average percentage of nonmanagerial and nonsupervisory employees participating in |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Adopted total quality management program | Underwent reengineering within past 3 years | Participated in performance benchmarking | Job rotation | Self-managed teams |
| 1994 |  |  |  |  |  |
| Total | 36.6 | - | 22.7 | 18.8 | 13.1 |
| 20-49 | 33.1 | - | 19.2 | 21.6 | 13.8 |
| 50-99 | 37.3 | - | 24.6 | 13.7 | 12.0 |
| 100-249 | 42.6 | - | 26.2 | 16.7 | 12.1 |
| 250 or more | 59.9 | - | 47.1 | 12.1 | 11.6 |
| 1997 |  |  |  |  |  |
| Total | - | 24.9 | 20.4 | 21.7 | 15.5 |
| 20-49 | - | 20.4 | 15.6 | 24.6 | 16.3 |
| 50-99 | - | 29.2 | 24.7 | 16.7 | 13.9 |
| 100-249 | - | 30.9 | 28.8 | 17.8 | 14.1 |
| 250 or more | - | 44.9 | 39.3 | 18.4 | 16.5 |

—Not available.
SOURCE: 1994 National Employer Survey, Phase I, and 1997 National Employer Survey, Phase II. Administered by the U.S. Bureau of the Census; designed and funded by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania.

- In 1994, 37 percent of surveyed employers had adopted Total Quality Management (TQM) practices (table 8). Although larger firms were more likely to report adopting TQM, one-third of firms in the smallest category also reported these practices.

## Employer Participation in School-to-Work Activities

Some employers are also participating in school-to-work partnerships and different kinds of work-based learning opportunities for students. Once again, however, these firms are in the minority.

- In 1997, one-quarter of surveyed employers reported participating in a school-to-work partnership (table 9; figure 5). Larger employers were more likely than smaller ones to report such participation.

Table 9—Percentage of employers reporting that they were involved in a school-to-work partnership, by firm size: 1997

| Firm size (number of employees) | School-to-work <br> partnership |
| :--- | :---: |
|  |  |
| Total | 25.4 |
|  |  |
| $20-49$ | 22.9 |
| $50-99$ | 23.8 |
| $100-249$ | 32.6 |
| 250 or more | 44.7 |

NOTE: The sample is made up of private, for-profit employers with 20 or more employees.

- Forty-two percent of employers in 1997 reported providing at least one formal workbased learning activity (table 10 and figure 6a). Twenty-one percent provided internships, 15 percent job shadowing, 14 percent cooperative education, and 10 percent mentoring. Larger employers and services industry employers were more likely to provide internships and job shadowing than other employers (table 10 and figure 6b).

## PERSPECTIVES ON EMPLOYEES

## Hiring Practices

Employers do not rate years of completed schooling or high academic performance as important as attitude and communication skills, when hiring front-line workers from among an established applicant pool. ${ }^{42}$ However, it may be that years of completed schooling and high academic performance are more important during initial applicant screening. ${ }^{43}$ It may also be that employers have historically found that schooling measures are not reliable indicators of what students know and are able to do. ${ }^{44}$ High academic performance may also not be as important as satisfactory academic performance.

[^28]- In 1997, employers rated attitude and communications skills as the most important factors in hiring front-line workers from an established applicant pool (4.6 and 4.1 on a 5point scale) (figure 7). In a list of six possible hiring factors, years of completed schooling ranked fourth in importance, and high academic performance fifth (2.9 and 2.5 on a 5-point scale).

Figure 7—Average employer rating of hiring factors for front-line workers ${ }^{1}$ in an established applicant pool: 1997

${ }^{1}$ For manufacturing establishments, the term "front-line workers" includes production workers; for other establishments, the term refers to sales and customer service workers.
${ }^{2}$ On a $1-5$ scale, a response of 1 indicates the hiring factor is not important and is not considered in hiring; a rating of 5 indicates it is very important to employers in hiring.
NOTE: The sample is made up of private, for-profit employers with 20 or more employees.
SOURCE: 1997 National Employer Survey, Phase II. Administered by the U.S. Bureau of the Census; designed and funded by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania.

## Education Levels of Front-Line Workers

Firms in the services industry report higher education levels of front-line workers than firms in the wholesale/retail trade industry and the construction, manufacturing, and transportation industries. ${ }^{45}$

- The education levels of front-line workers employed in service firms were higher than those of their counterparts employed in other types of firms in 1997 (table 11; figure 8). Fifty-six percent of front-line workers in service firms had at least some postsecondary education, compared with 20 percent of front-line workers in construction, manufacturing, and transportation firms and 39 percent of these workers in wholesale and retail trade firms.

[^29]Table 11—Percentage distribution of employers according to their estimations of the education levels of new front-line workers, ${ }^{1}$ by firm type: 1997

| Firm type | Some postsecondary <br> education |  |
| :--- | :---: | :---: |
| Total | 36.8 | High school <br> diploma or less |
| Construction, manufacturing, and transportation | 20.4 | 63.2 |
| Wholesale/retail trade | 38.7 | 79.6 |
| Services | 56.1 | 61.3 |

${ }^{1}$ For manufacturing establishments, the term "front-line workers" includes production workers; for other establishments, the term refers to sales and customer service workers.
${ }^{2}$ Certification, some college, 2-year degree, or 4-year degree or higher.

## Skill Requirements

Most employers report that front-line skill requirements are increasing.

- In 1997, 53 percent of employers reported that the skills required to do production or support jobs at an acceptable level increased in the previous 3 years, while 41 percent reported that required skills stayed the same and 6 percent reported that they decreased (figure 9).

Figure 9-Percentage distribution of employers reporting that the skills required to do production or support jobs at an acceptable level increased, decreased, or remained the same during the last 3 years: 1997

SOURCE: 1997 National Employer Survey, Phase II. Administered by the U.S. Bureau of the Census; designed and funded by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania.

## Worker Proficiency and Training

According to most employers, the proficiency of their front-line workers either stayed the same or increased between 1994 and 1997. Employer-provided training, which also increased over this 3-year period, may have contributed to proficiency gains. Alternatively, education reform efforts over the last decade may have contributed to the improvement in worker proficiency. In either case, it is impossible to establish a causal link from the available data.

- Fifty-five percent of employers surveyed in 1997 reported that the proficiency of frontline workers remained the same over the last 3 years (1994-97) (table 12). About onethird said the proficiency of these workers increased, while 14 percent said it decreased. Firms in the lowest revenue category (less than $\$ 1$ million per year) were generally less likely to report that the proficiency of their front-line workers increased (figure 10).

Table 12-Percentage distribution of employers reporting that the proficiency of front-line workers* has increased, decreased, or remained the same during the last $\mathbf{3}$ years, by firm revenues: 1997

| 1996 Firm revenues (in millions) | Increased | Decreased | Remained the same |
| :--- | :---: | :---: | :---: |
| Total | 31.9 |  |  |
|  |  | 13.7 | 54.5 |
| Less than $\$ 1$ | 15.2 | 22.1 |  |
| $\$ 1-10$ | 33.5 | 10.1 | 62.8 |
| $\$ 10-100$ | 35.7 | 14.4 | 56.4 |
| More than $\$ 100$ | 38.6 | 6.7 | 49.8 |

SOURCE: 1997 National Employer Survey, Phase II. Administered by the U.S. Bureau of the Census; designed and funded by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania.

- Seventy-two percent of employers in 1997 reported increasing the amount of formal training provided to workers in the previous 3 years (figure 11a). Economic reasons-to remain competitive and improve the quality of output-were more likely to be given as the cause of this increase in training than lack of skills among newly hired workers (figure 11b).

Figure 11a-Percentage distribution of employers reporting that the formal training provided to employees has increased, decreased, or remained the same during the last 3 years: 1994

## Comparing Previous Work-Based Learning and On-the-Job Experiences

The majority of employers with new front-line employees who participated in work-based learning report that these employees are superior to comparable new hires in terms of productivity and attitude. Virtually no employers report that new front-line workers with work-based learning experience are inferior in these two respects to comparable new hires. ${ }^{46}$

- In 1997, of those employers who reported hiring front-line workers with prior workbased learning experience (cooperative education, internships, or apprenticeships), most were more satisfied with these new hires than with other newly hired front-line workers aged 18-25 (table 13; figures 12a and 12b). Sixty-two percent reported that the new hires with work-based learning experience were more productive than workers aged 18-25 without such experience. Sixty-five percent reported that the attitude of these employees was better than that of their counterparts. At least one-third of employers reported that the productivity or attitude of front-line workers with work-based learning experience was about the same as that of other young new hires. No more than 1 percent of employers reported that the productivity or attitude of front-line workers with work-based learning experience was worse than that of other young new hires.

Table 13—Among firms with employees with work-based learning (WBL) experience, percentage distribution of employers according to their evaluations of new front-line workers ${ }^{1}$ with WBL experience $^{2}$ versus their non-WBL counterparts aged 18-25, by selected employee characteristics: 1997

| Selected employee characteristics | Rated WBL <br> employees the same | Rated WBL <br> employees better | Rated WBL <br> employees worse |
| :--- | :---: | :---: | :---: |
| Productivity | 37.6 | 61.9 | 0.5 |
| Attitude | 34.0 | 65.1 | 0.9 |

${ }^{1}$ For manufacturing establishments, the term "front-line workers" includes production workers; for other establishments, the term refers to sales and customer service workers.
${ }^{2}$ The work-based learning experiences of these new front-line workers may have taken place at the current employer's firm or at another firm.

NOTE: The sample is made up of private, for-profit employers with 20 or more employees. Percentages may not add to 100 due to rounding.
SOURCE: 1997 National Employer Survey, Phase II. Administered by the U.S. Bureau of the Census; designed and funded by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania.

SOURCE: 1997 National Employer Survey, Phase II. Administered by the U.S. Bureau of the Census; designed and funded by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania.

- Eighty-one percent of firms in 1997 who reported hiring front-line workers with prior work-based learning experience reported that none of these new hires needed remedial training in reading or mathematics (figure 13). Fifty-six percent of these firms also reported that none of their front-line workers with work-based learning experience were fired within 1 year of being hired, and 35 percent reported that none of these employees quit within a year of being hired. However, the survey did not ask for comparable information about front-line workers who did not have prior work-based learning experience.

## IV. Trends in Secondary Vocational Education

## OVERVIEW

This chapter provides information on trends in secondary vocational education during the period 1982-1994. Because little vocational education has historically been provided by private schools, the analysis focuses on public high schools (grades 9 through 12). The chapter also provides data on school reform efforts as of 1997 and teacher trends from 1991 to 1994. Specifically, this chapter provides information on these key topics:

- participation in vocational education
- characteristics of students participating in vocational education
- academic coursetaking and achievement
- school reform efforts
- work experience and work-based learning
- technology literacy
- vocational teachers

When making comparisons among different groups of high school graduates, three cur-riculum-based definitions were used:

Vocational concentrators completed 3.0 or more credits in a single occupational program area. ${ }^{47}$ These program areas include the following:

- agriculture and renewable resources
- business
- marketing and distribution

[^31]- health care
- public and protective services
- trade and industry
- technology and communications
- child care and education
- food service and hospitality
- personal and other services

College preparatory students completed a college preparatory course of study that was consistent with the prevailing entrance requirements at public 4 -year institutions. ${ }^{48}$ These included 4.0 credits in English; 3.0 credits in mathematics at the Algebra 1 level or higher; 2.0 credits in biology, chemistry, and/or physics; 2.0 credits in social studies with at least 1.0 credit in U.S. or World History; and 2.0 credits in a single foreign language.

Other/general students met neither of the above criteria.
Students who met both the vocational concentrator and college preparatory criteria were included in the vocational concentrators total in the tables and figures. Students who met only the vocational concentrator criteria, as well as the "both" group, were also reported separately. In most instances, the chapter focuses on the vocational concentrators total, and refers to this group simply as "vocational concentrators." When the chapter describes students who met only the vocational concentrator criteria or those who met both the vocational concentrator and college preparatory criteria, the text makes it clear that these subgroups are being discussed.

As previewed in the Introduction, the data sets used in this chapter include the following:

- High School and Beyond (HS\&B) Sophomore Cohort Surveys and High School Transcript Study (describing 1982 high school graduates)
- High School Transcript Studies (HSTS) of 1990 and 1994 (describing 1990 and 1994 high school graduates)
- National Education Longitudinal Study of 1988 (NELS:88) Surveys, Assessment File, and High School Transcript Study (describing 1992 high school graduates)

[^32]- National Longitudinal Study of Youth (NLSY) of 1997 (describing schools with a 12th grade)
- Schools and Staffing Surveys (SASS) of 1991 and 1994 (describing teachers)

The first three data sets, HS\&B, HSTS:90, and HSTS:94, form the foundation of the trend analysis in this chapter. They contain transcript data, which provide a rich source of information on course-taking patterns, as well as other survey information. NELS:88 was used primarily to examine the relationship between vocational coursetaking and achievement test gains between the 8th and 12th grades. NLSY provided information on the extent to which certain school reforms have been implemented in public schools with a 12th grade. ${ }^{49}$ SASS was used to provide trend data (1991-94) on the qualifications, experience, and demographic characteristics of vocational teachers, as well as to allow comparisons with other teachers. SASS:94 included questions that provide baseline data on teachers' professional development activities.

## PARTICIPATION IN VOCATIONAL EDUCATION

From 1982 to 1994, there was a general decline in the participation of high school students in vocational education. The percentage of public high school graduates taking at least one vocational education course decreased slightly. However, the decline in the percentage of graduates completing a sequence of related occupational courses was more dramatic. These decreases may be partly due to increases in high school graduation requirements implemented by many states after the publication of $A$ Nation at Risk ${ }^{50}$ in 1983. As students have been required to take more academic coursework, they may have elected to take fewer vocational courses. See figure 1 in the Introduction for a summary of the high school curriculum categories referred to in this section (that is, the academic, vocational (and its subcategories), and enrichment/other curricula).

- The total amount of coursework completed by public high school graduates increased, on average, from 21.6 credits in 1982 to 24.2 credits in 1994, an increase of 12 percent (table 14; figure 14). This change was driven by a 23 percent increase in completed academic credits. The average number of credits public high school graduates earned in the enrichment/other curriculum remained steady over this time period at about 2.6 , while the average number of vocational credits earned fell from 4.7 to 4.0. In 1994, credits

[^33]earned in the vocational education curriculum fell to 16 percent of total high school credits, while the share in 1982 was about 22 percent.

Table 14—Average number of Carnegie units accumulated by public high school graduates, by type of coursework: 1982, 1990, and 1994

| Type of coursework | 1982 | 1990 | 1994 |
| :--- | ---: | ---: | ---: |
| Total | 21.60 | 23.53 | 24.17 |
| Academic | 14.28 | 16.66 | 17.58 |
| Vocational total | 4.68 | 4.19 | 3.96 |
| Specific labor market preparation | 3.03 | 2.89 | 2.79 |
| General labor market preparation | 0.95 | 0.73 | 0.64 |
| Consumer and homemaking education | 0.69 | 0.57 | 0.52 |
| Enrichment/other | 2.64 | 2.68 | 2.63 |

NOTE: Averages may not add to totals due to rounding.

*Includes Carnegie units earned in enrichment/other courses.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

- The percentage of public high school graduates taking at least one vocational education course decreased slightly from 98.2 percent in 1982 to 97.2 percent in 1994 (table 1 in
the Introduction). Although the percentage of graduates taking at least one specific labor market preparation course increased slightly from 88.7 percent in 1982 to 90.8 percent in 1994, the average amount of coursework completed in the specific labor market preparation curriculum declined from 3.0 credits to 2.8 credits over the same time period (tables 1 and 14).
- The percentage of graduates concentrating in the vocational curriculum (taking three or more courses in a single occupational program area) decreased from 34 percent in 1982 to 25 percent in 1994, a decline of about 25 percent (figure 15; table 15). The percentage of graduates specializing in the vocational curriculum (taking four or more courses in a single occupational program area with at least two of those courses beyond the introductory level) declined more dramatically, from 13 percent in 1982 to 7 percent in 1994, a decline of about 44 percent.

Figure 15-Percentage distribution of public high school graduates according to their curriculum specialization in high school: 1982, 1990, and 1994

*Includes students who completed both a vocational concentration and a college preparatory curriculum.

| :--- | :---: | ---: | ---: |
|  |  |  |  |
| Concentrators | 33.7 | 27.8 | 25.4 |
| Specialists | 12.6 | 7.7 | 7.0 |

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

- Trade and industry and business were the most popular occupational programs in 1994about 8 percent of graduates concentrated in each of these areas (table 16). These were also the most popular programs in earlier years; however, the percentage of graduates concentrating in trade and industry, as well as the percentage concentrating in business, declined over the period studied. In 1982, about 15 percent of graduates had concentrated in trade and industry and 12 percent in business.
- Fewer students concentrated in health care and in technology and communications than in business and in trade and industry in all the surveyed years from 1982 to 1994 (table 16). However, contrary to business and trade and industry trends, the proportions of students who concentrated in health care and in technology and communications increased between 1982 and 1994.51

## CHARACTERISTICS OF STUDENTS PARTICIPATING IN VOCATIONAL EDUCATION

Although participation in the specific occupational curriculum declined for most groups of students between 1982 and 1994, there were a few exceptions to this trend. The percentage of black and Asian/Pacific Islander students concentrating in vocational education stayed about the same over this period, and the concentration rate of students with disabilities increased. ${ }^{52}$ In addition, the average number of specific occupational credits earned by blacks stayed about the same and increased for Asians/Pacific Islanders and students with disabilities. The increase in participation of students with disabilities is consistent with the emphasis of the 1990 Perkins Act on serving students with special needs.

[^34]Table 16-Percentage of public high school graduates concentrating (accumulating 3 or more credits) in various vocational programs: 1982, 1990,

|  | Agriculture and renewable resources | Business | Marketing and distribution | Health care | Public and protective services | Trade and industry | $\begin{aligned} & \text { Technology } \\ & \text { and } \\ & \text { communi- } \\ & \text { cations } \\ & \hline \end{aligned}$ | Occupational home economics |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Year |  |  |  |  |  |  |  | Total | Personal and other services | Food service and hospitality | Child care and education |
| 1982 | 2.8 | 11.6 | 1.8 | 0.6 | 0.0 | 14.8 | 0.5 | 1.7 | 1.3 | 0.2 | 0.2 |
| 1990 | 2.5 | 8.4 | 2.1 | 0.6 | 0.0 | 11.2 | 0.8 | 2.0 | 1.3 | 0.5 | 0.3 |
| 1994 | 3.2 | 7.7 | 2.2 | 1.0 | 0.0 | 8.5 | 0.9 | 2.0 | 1.1 | 0.4 | 0.6 |

NOTE: Estimates appearing as 0.0 may be nonzero but less than 0.05 .
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

In all the surveyed years from 1982 to 1994, male students, students in rural schools, and students with lower grade-point averages (GPAs) completed more specific occupational coursework and were more likely to be vocational concentrators than female students, students in urban and suburban schools, and students with higher GPAs.

## Participation in Vocational Education Overall

Although the decline in vocational coursetaking between 1982 and 1994 was apparent for most groups, the decline was steeper for females than males and for Hispanics than other racialethnic groups. In contrast, students with disabilities increased their vocational coursetaking over this period.

- In 1994, both male and female public high school graduates earned approximately 24 credits in total coursework (table 17). Females averaged about 18 credits in academic classes, whereas males averaged 17. Both females and males increased their academic coursework from 1982 to 1994. However, the rate of increase was faster for female high school graduates than for their male counterparts, resulting in a greater gender difference in academic course completion in 1994 than in 1982. The number of vocational credits completed by both male and female public high school graduates decreased between 1982 and 1994. Although males and females completed about the same amount of vocational coursework in 1982, the number of vocational credits earned by females decreased at a faster rate than that of male graduates from 1982 to 1994. Consequently, males earned more vocational credits than females in 1994, completing 4.1 credits versus 3.8 for females.
- In all the surveyed years from 1982 to 1994, Asian/Pacific Islander students completed fewer courses in the vocational curriculum than did students of other race-ethnicities (table 18). Asians/Pacific Islanders earned about 3.0 vocational credits in 1994, while other students completed between 3.9 and 4.3 credits, on average. Hispanic students completed more vocational credits than white students in 1982; however, the two groups completed similar amounts in 1990 and 1994. ${ }^{53}$ All students, despite their race-ethnicity, decreased the amount of vocational coursework they completed between 1982 and 1994. During this period, Hispanics had the sharpest decline in the amount of vocational coursework completed.

[^35]Table 17—Average number of Carnegie units accumulated by public high school graduates, by type of
coursework and sex: 1982, 1990, and 1994

| Type of coursework and sex | 1982 | 1990 | 1994 |
| :--- | :---: | :---: | :---: |
| Total | 21.60 | 23.53 | 24.17 |
| Male | 21.43 | 23.35 | 23.99 |
| Female | 21.76 | 23.69 |  |
| Academic | 14.28 | 16.66 | 17.58 |
| Male | 14.00 | 16.17 | 17.03 |
| Female | 14.55 | 17.10 | 18.11 |

| Hispanic | 5.26 | 4.12 | 3.87 |  | 3.30 | 2.85 | 2.75 |  |
| White, non-Hispanic | 4.59 | 4.22 | 3.96 |  | 3.02 | 2.97 | 2.81 |  |

[^36]- Students with and without disabilities increased at similar rates the amount of total high school coursework they completed between 1982 and 1994 (table 19). However, trends differed by type of coursework. ${ }^{54}$ Students without disabilities completed 23 percent more academic credits in 1994 than they had completed in 1982, while students with disabilities maintained a steady academic course load of about 14 credits. In contrast, students without disabilities decreased their vocational coursetaking by 17 percent between 1982 and 1994, and students with disabilities increased their vocational coursework by about 24 percent over the same period. Therefore, although students with and without disabilities completed similar amounts of vocational coursework in 1982,

NOTE: Averages may not add to totals due to rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

[^37]students with disabilities completed significantly more vocational credits than students without disabilities in 1990 and 1994. In fact, students with disabilities completed 54 percent more vocational credits in 1994 than students without disabilities. Students with disabilities also completed increasing numbers of enrichment/other credits throughout this period. In 1994, students with disabilities averaged 3.6 enrichment/other credits upon graduation, and students without disabilities earned 2.6 credits.

- In all the years surveyed, there was a positive relationship between graduates' GPAs and the total amount of coursework they completed (table 20). That is, graduates with higher GPAs completed more total coursework. Similarly, there was a positive association between GPA and academic coursetaking. Conversely, during this period, students with lower GPAs generally completed more vocational credits.
- In all the years surveyed, students graduating from rural high schools completed more vocational coursework than graduates of urban and suburban public high schools (table 21). These differences in vocational coursetaking remained relatively constant between 1982 and 1994.

## Participation in Specific Occupational Programs

While specific occupational coursetaking declined for most groups between 1982 and 1994, it stayed about the same for blacks and for rural high school graduates. In addition, the number of specific occupational credits earned by Asians/Pacific Islanders and students with disabilities increased over the period studied.

- In 1994, male public high school graduates earned 22 percent more specific occupational credits than their female peers (table 17). This gender gap remained relatively constant between 1982 and 1994.
- Asian/Pacific Islander graduates increased their specific occupational coursetaking between 1982 and 1994 (table 18). Despite this increase, Asian/Pacific Islander graduates completed fewer specific occupational credits than students of other race-ethnicities in all the years studied. American Indian/Alaskan Native, Hispanic, and white graduates all completed fewer specific occupational credits in 1994 than they had in 1982, with the number of specific occupational credits earned by Hispanics decreasing at a faster rate than that of whites. Black students earned about the same number of specific occupational credits in all 3 years.

Table 20—Average number of Carnegie units accumulated by public high school graduates, by grade point average (GPA) and type of coursework: 1982, 1990, and 1994

| GPA and type of coursework | 1982 | 1990 | 1994 |

IV. Trends in Secondary Vocational Education

Table 21—Average number of Carnegie units accumulated by public high school graduates in the vocational and specific labor market preparation curricula, by school urbanicity: 1982, 1990, and 1994

|  | Vocational total |  |  |  |  | Specific labor market preparation |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| School urbanicity | 1982 | 1990 | 1994 |  | 1982 | 1990 | 1994 |  |
| Total | 4.68 | 4.19 | 3.96 |  | 3.03 | 2.89 | 2.79 |  |
|  |  |  |  |  |  |  |  |  |
| Rural | 5.23 | 4.66 | 4.68 |  | 3.32 | 3.22 | 3.25 |  |
| Urban | 4.28 | 3.66 | 3.34 |  | 2.83 | 2.52 | 2.39 |  |
| Suburban | 4.46 | 3.98 | 3.47 |  | 2.91 | 2.69 | 2.52 |  |

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

- Graduates with disabilities increased the number of specific occupational credits they earned by 25 percent between 1982 and 1994 (table 19). Over the same period, graduates without disabilities completed 9 percent fewer of these credits. These contrasting trends led to a gap in specific occupational credits earned in 1994, with students who had disabilities earning 36 percent more credits than students without disabilities.
- In all the years surveyed from 1982 to 1994, graduates who earned higher GPAs completed fewer specific occupational credits than graduates with lower GPAs (table 20).
- Students graduating from rural public high schools in 1982, 1990, and 1994 completed more specific occupational courses than students graduating from either urban or suburban schools (table 21). The amount of specific occupational coursework students graduating from urban and suburban schools completed decreased between 1982 and 1994, with a steeper decline for urban graduates than for suburban ones. Students graduating from rural schools, however, did not significantly change their specific occupational course-taking patterns over the years studied.

## Concentration in Vocational Education

While rates of concentration in vocational education declined for most groups between 1982 and 1994, they stayed about the same for blacks and Asians/Pacific Islanders and increased for students with disabilities.

- The percentage of graduates concentrating in the vocational curriculum (taking three or more courses in a single occupational program area) decreased over time for both male and female students (table 22). Rates of vocational concentration decreased uniformly
across rural, suburban, and urban schools. The percentage of graduates specializing in the vocational curriculum (completing four or more courses in a single occupational program area, with at least two of those courses beyond the introductory level) decreased for all categories of gender, GPA, and school urbanicity.
- In 1994, 29 percent of male public high school graduates were vocational concentrators, compared with 22 percent of female graduates (table 22). About 9 percent of males were vocational specialists, compared with about 6 percent of females. These 1994 gender disparities in vocational concentration and specialization are similar to the gender gaps in 1982 and 1990.

Table 22-Percentage of public high school graduates concentrating (accumulating $\mathbf{3}$ or more credits) and specializing (accumulating 4 or more credits with 2 or more of those credits beyond the introductory level) in vocational programs, by selected student and school characteristics: 1982, 1990, and 1994

| Selected student and school characteristics | Vocational concentrators |  |  | Vocational specialists |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1982 | 1990 | 1994 | 1982 | 1990 | 1994 |
| Total | 33.7 | 27.8 | 25.4 | 12.6 | 7.7 | 7.0 |
| Sex |  |  |  |  |  |  |
| Male | 39.0 | 32.3 | 28.8 | 14.9 | 9.2 | 8.5 |

| Race-ethnicity |  |  |  |  |  |  |
| American Indian/Alaskan Native | 46.6 | 38.0 | 20.9 | 6.2 | 12.4 | 2.5 |
| Asian/Pacific Islander | 17.3 | 16.6 | 14.2 | 5.0 | 1.4 | 3.8 |
| Black, non-Hispanic | 32.7 | 27.3 | 29.0 | 11.7 | 7.8 | 8.2 |
| Hispanic | 37.7 | 27.9 | 24.9 | 13.2 | 7.2 | 6.5 |
| White, non-Hispanic | 33.2 | 28.5 | 25.3 | 12.9 | 8.1 | 7.1 |
| Disability status |  |  |  |  |  |  |
| Has disability | 31.5 | 42.2 | 41.3 | 12.9 | 10.4 | 12.4 |
| No disability | 33.8 | 27.4 | 24.8 | 12.6 | 7.6 | 6.8 |
| Grade point average |  |  |  |  |  |  |
| 3.3 or more | 19.8 | 13.6 | 14.6 | 7.4 | 3.0 | 2.8 |
| 2.6-3.29 | 30.9 | 23.8 | 23.9 | 12.3 | 6.4 | 6.6 |
| 1.6-2.59 | 40.3 | 35.1 | 31.8 | 14.5 | 10.2 | 9.5 |
| Less than 1.6 | 36.1 | 34.7 | 31.8 | 13.9 | 9.6 | 7.8 |
| School urbanicity |  |  |  |  |  |  |
| Rural | 38.3 | 32.1 | 31.9 | 13.7 | 8.5 | 9.1 |
| Suburban | 31.8 | 26.5 | 22.3 | 12.7 | 10.4 | 6.5 |
| Urban | 30.7 | 22.6 | 19.3 | 10.6 | 5.9 | 4.9 |

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

- Hispanics, American Indians/Alaskan Natives, and whites all decreased their rates of vocational concentration in public high school during the time period studied (table 22). Black graduates, as well as Asian/Pacific Islander graduates, did not significantly change their concentration rates over the years. In 1994, 29 percent of black students concentrated in vocational education, compared with about 25 percent of white and Hispanic students, 21 percent of American Indian/Alaskan Native students, and 14 percent of Asian/Pacific Islander students.
- Rates of specializing in vocational education (taking four or more courses in a single occupational program area, with at least two of those courses beyond the introductory level) declined among black, Hispanic, and white graduates between 1982 and 1994 (table 22). On the other hand, there was no consistent trend in the specialization rate for American Indians/Alaskan Natives during the 3 years studied, although their rate of specialization in vocational education declined significantly between 1990 and 1994. The specialization rate for Asians/Pacific Islanders did not change significantly over the 1982-1994 period. In 1994, American Indian/Alaskan Native and Asian/Pacific Islander graduates were generally less likely than graduates from all other racial-ethnic groups to specialize in vocational education. ${ }^{55}$
- Students with disabilities increased their rates of concentration in the vocational curriculum from 32 to 41 percent during the years studied (table 22). Conversely, rates of vocational concentration declined steadily among students without disabilities, from 34 percent in 1982 to 25 percent in 1994. The rate at which students without disabilities specialized in the vocational curriculum also decreased by almost one-half, from 13 percent in 1982 to 7 percent in 1994. Rates of vocational specialization among students with disabilities remained relatively similar over the years studied.
- Public high school graduates with GPAs of 1.6 or higher had decreasing rates of concentration in the vocational curriculum between 1982 and 1994 (table 22). Students with GPAs of less than 1.6 were about equally likely to concentrate in vocational education during all of the years studied, with approximately one-third concentrating in vocational education in each year. In 1994, 15 percent of students with GPAs of 3.3 or higher concentrated in vocational education, and 3 percent of such students were vocational specialists. These rates of concentration and specialization were significantly lower than the rates for students earning lower GPAs. For example, in 1994, 32 percent of students with

[^38]GPAs between 1.6 and 2.59 concentrated in vocational education, and 10 percent of such students were vocational specialists.

- In all 3 years studied, students graduating from rural public high schools were more likely to concentrate in vocational education than students graduating from suburban and urban schools (table 22). ${ }^{56}$ In 1994, about 32 percent of rural graduates in comparison with 22 percent of suburban and 19 percent of urban graduates concentrated in vocational education.

## ACADEMIC COURSETAKING AND ACHIEVEMENT

## Academic Course-Taking Trends

The academic preparation of students participating in vocational education increased between 1982 and 1994, in both absolute and relative terms. While public high school graduates in general increased their coursetaking in the core academic subjects (English, mathematics, science, and social studies), the rate of increase over the period studied was greater for vocational concentrators than for either college preparatory or other/general students. However, in 1994, vocational concentrators still completed fewer total credits in each of the core academic subjects than did either college preparatory or other/general students. Vocational concentrators also generally increased the rigor of their academic coursework, particularly in mathematics, science, and social studies.

- The percentage of public high school graduates meeting the "New Basics" ${ }^{57}$ core academic standards increased from 13 percent in 1982 to 38 percent in 1990, and then to 50 percent in 1994 (table 23). ${ }^{58}$

[^39]Table 23-Percentage of public high school graduates meeting the New Basics core academic standards, ${ }^{1}$ by curriculum specialization in high school: 1982, 1990, and 1994

| Curriculum specialization and |  |  |  |

| Social studies - 3 years | 69.9 | 87.9 | 88.6 |

${ }^{1}$ The New Basics core academic standards include 4 years of English and 3 years each of mathematics, science, and social studies.
${ }^{2}$ This category includes some vocational concentrators who also completed a college preparatory curriculum.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

- In 1994, vocational concentrators were less likely than graduates completing a college preparatory curriculum to meet the core academic standards ( 33 versus 90 percent), but were just as likely as graduates completing general coursework to do so ( 33 versus 30 percent) (table 23; figure 16). ${ }^{59}$ The percentage of vocational concentrators meeting these standards increased from 5 percent in 1982. The percentage of vocational concentrators meeting the core academic standards in 1994 was about six times the percentage in 1982, compared with an increase of about three times for other/general students and of about 38 percent for college preparatory students.

Figure 16-Percentage of public high school graduates meeting the New Basics core academic standards, ${ }^{1}$ by curriculum specialization in high school: 1982, 1990, and 1994

${ }^{1}$ The New Basics core academic standards include 4 years of English and 3 years each of mathematics, science, and social studies.
${ }^{2}$ Includes students who completed both a vocational concentration and a college preparatory curriculum.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

[^40]- The percentage of vocational concentrators completing the science standard increased from 13 to 45 percent between 1982 and 1994 (table 23). However, vocational concentrators were least likely to meet the science standard than any other core academic standard in 1994. While 45 percent of vocational concentrators met the science standard in 1994, 71 percent met the mathematics standard, 84 percent the social studies standard, and 89 percent the English standard. Students who completed general coursework in high school were also least likely to meet the science standard versus other standards.
- The percentage of public high school graduates completing both a vocational concentration and a college preparatory curriculum increased seven and a half times, from 0.6 in 1982 to 4.5 percent in 1994 (table 24). The percentage of graduates completing neither a vocational concentration nor a college preparatory curriculum decreased from about 58 percent in 1982 to 42 percent in 1994. In 1994, more students still completed general coursework in high school than completed either a vocational concentration or a college preparatory curriculum.

Table 24—Percentage distribution of public high school graduates according to curriculum specialization in high school: 1982, 1990, and 1994

- The percentage of all graduates taking Algebra 1 in high school increased from 59 percent in 1982 to 69 percent in 1994, an increase of 17 percent (table 27). Over the same period, the percentage of vocational concentrators taking this subject increased from 52 to 67 percent, an increase of 29 percent. The total number of credits vocational concentrators earned in mathematics increased steadily from 2.3 in 1982 to 3.0 in 1994 (table 28). The number of credits earned in courses below the Algebra 1 level increased from .95 in 1982 to 1.2 in 1990, and then fell again to .95 in 1994. The share of total mathematics credits that these below-algebra credits represented fell steadily from 47 percent in 1982, to 44 percent in 1990, to 35 percent in 1994.

- During this same period, the number of credits vocational concentrators earned in biology, chemistry, and physics rose from .96 to 1.6 , an increase of 68 percent (table 29). In 1994, vocational concentrators completed, on average, one biology course. In addition, about one in three vocational concentrators completed a chemistry course in 1994, and one in eight, a physics course (table 30). The proportion of science credits vocational concentrators earned that were at the basic level decreased steadily from 37 percent in 1982, to 24 percent in 1990, to 21 percent in 1994 (table 29).

## Academic Achievement Gains

As discussed in the Introduction to this report, the purpose of vocational education has broadened over the last 15 years to include increasing the academic achievement of students participating in vocational programs. In addition to improving the rigor of the academic courses that students in vocational programs take, education reformers advocate strengthening the academic content of vocational coursework. ${ }^{60}$ This section of the report examines the academic achievement gains of 1992 public high school graduates. These gains were measured using mathematics, reading, and science test scores in the 8th, 10th, and 12th grades. Composite test results combining scores for all three subjects were also examined.

Since the relationship between academic achievement and participation in the vocational curriculum is complex, results must be interpreted cautiously. Descriptive analyses typically find that increased vocational coursetaking is associated with lower academic achievement. ${ }^{61}$ However, attributing this lower achievement to participation in the vocational curriculum could be misleading. An alternate explanation for the inverse association between achievement and vocational program participation is that, at least historically, lower-achieving students have opted or been encouraged to follow a vocational program of study in high school. Thus, the gap in academic achievement between vocational concentrators and other students may be attributed, at least partly, to their initial differences in achievement. Moreover, these initially low-achieving students are likely to complete less rigorous academic coursework during high school than their

higher-achieving peers, thereby compounding their academic disadvantage and possibly widening the achievement gap.

Using the National Education Longitudinal Study of 1988 (NELS:88), it was possible to examine the relationship between students' achievement in the 8th grade and their subsequent coursetaking in high school. The analysis found that lower-achieving 8th graders were more likely to become vocational concentrators in high school than their higher-achieving counterparts. For example, 33 percent of 1992 public high school graduates who scored in the lowest composite test quartile in the 8th grade became vocational concentrators only (not also completing the college preparatory criteria), in comparison with 8 percent of graduates who scored in the highest 8th-grade composite test quartile-a difference of a factor of 4 (table 31). Thus, there is

Table 31—Percentage distribution of 1988 8th graders according to subsequent specialization in high school, by 8th-grade composite test score quartiles: 1992

some evidence that lower-achieving students were, in fact, more likely than higher-achieving students to concentrate in vocational education in high school, at least as of 1992.

There is also evidence that these initial 8th-grade differences in achievement may have been compounded by differential course-taking patterns in high school. Variations exist in the amount and rigor of academic courses taken by students completing different types of curricula. These differences were reflected in the NELS:88 data for 1992 graduates. Vocational concentrators had academic course-taking patterns that were more like those of graduates who completed general coursework in high school than like those of college preparatory graduates.

For example, vocational concentrators and other/general students were more likely than their college preparatory peers to take lower-level English courses (such as language skills and functional and basic courses) (table 32a). Vocational concentrators also completed more mathematics courses at a level lower than Algebra 1 than did both college preparatory and other/general students (table 32b). Even when controlling for prior achievement-as measured by 8th-grade mathematics test score quartiles-lower-level mathematics coursetaking was generally dissimilar for these groups of students (figure 17). ${ }^{62}$

In contrast, college preparatory students were more likely to complete more and higherlevel courses in English, mathematics, and science than their vocational and other/general peers (tables $32 \mathrm{a}-\mathrm{c}$ ). On average, college preparatory students took 3.8 credits in mathematics, 4.4 credits in English, and 3.7 credits in science, while their vocational peers completed 2.9 credits in mathematics, 4.1 credits in English, and 2.5 credits in science. Furthermore, college preparatory students earned, on average, 1.6 credits in precalculus, 0.5 credits in physics, and 1.2 credits in advanced English, whereas vocational concentrators completed 0.5 credits in precalculus, 0.1 credits in physics, and 0.2 credits in advanced English.

Given these differences in initial achievement and academic coursework in high school, a gap in academic gains would not be unexpected, particularly between the vocational concentrator and college preparatory groups. In fact, 1992 vocational concentrators did exhibit lower test score gains in reading, mathematics, and science than their college preparatory peers, but more similar gains to graduates who completed general coursework in high school (table 33). This was generally true for 8 th- to 10th-grade gains, 10th- to 12 th-grade gains, and 8th- to 12 th-grade gains. ${ }^{63}$

The usual statistical method for attempting to control for and separate out the various factors contributing to academic achievement-multivariate regression analysis-was beyond the scope of this study. However, this analysis attempted to reduce in two ways the bias that may be due to vocational concentrators having lower initial academic achievement. First, by examining gains at two or more points in time, rather than achievement at a single point in time, the analysis effectively controlled for those characteristics that are consistent over time. ${ }^{64}$ Second, the analysis used three-way tables to control for prior academic achievement as measured by the student's 8th-grade test quartile. However, despite this partial control for prior achievement, many differences among the vocational concentrator, college preparatory, and other/general groups remained statistically significant (tables 34-36). For example, among students who were in the middle two test quartiles in the 8th grade, vocational concentrators gained 18 test score points in reading and 23 in mathematics by the 12th grade, in comparison with 19 and 24 points for other/general students and 22 and 29 points for college preparatory students, in reading and mathematics, respectively (figure 18). ${ }^{65}$

One finding of this analysis was that the academic coursework of vocational concentrators who also completed a college preparatory curriculum was more like the coursework of the college preparatory group than like that of other vocational concentrators. For example, this academically oriented group of vocational concentrators earned fewer low-level mathematics and English credits than their strictly vocational counterparts (tables 32a,b and 37). In keeping with this similarity in coursetaking, the test score gains for vocational concentrators who also completed a college preparatory curriculum were generally statistically indistinguishable from those of the college preparatory group, and these vocational concentrators generally outperformed their vocational peers who did not complete a college preparatory curriculum (tables 33-36).

This suggests that the achievement gap may be narrowed by providing students in vocational programs with a challenging academic curriculum. However, it may also be that vocational concentrators who also take a college preparatory curriculum are different from other vocational concentrators in ways that impact academic achievement. For example, as 8th-grade achievement increased, so did the likelihood that students would meet both the vocational concentrator and college preparatory criteria in high school. In contrast, 8th-grade achievement was inversely related to the likelihood of students meeting only the vocational concentrator criteria (table 31). The direct impact of vocational concentrators taking more rigorous academic coursework cannot be determined by these descriptive data.

## SCHOOL REFORM EFFORTS

By 1997, public comprehensive high schools reported implementing some vocational edu-cation-related reforms, although the quality and specific forms of these efforts were not discernible from the available survey data. ${ }^{66}$ About half of these schools reported integrating academic and vocational education, and a similar proportion reported offering tech prep. Fewer schools reported having block scheduling, career majors, school-based enterprises, skill standards, or skill or occupational certificates. Generally, schools with career academies and larger schools were more likely to report these reforms, while rural schools were less likely to do so.

- In 1997, 90 percent of public high schools reported that teachers attended conferences on integrating academic and vocational education, and almost half ( 45 percent) reported actually integrating these curricula (table 38; figure 19). Schools with career academies were more likely than other schools to report that academic and vocational curricula were being integrated, with 78 percent of career academy schools reporting such activity. Rural schools were less likely to implement integration, as were smaller schools. As mentioned above, it is not possible from the available data to discern the quality and specific forms of the integration activities reported.

[^47]Table 38-Percentage of public schools reporting various efforts to integrate academic and vocational education, by selected school characteristics: 1997

- About 50 percent of public high schools offered tech prep (table 39; figure 20). ${ }^{67}$ Schools more likely to offer this program included schools in the Midwest and West (versus those in the Northeast and South); suburban schools (with urban schools second and rural schools last); schools with a career academy (versus those without); and larger schools.

- Thirty-nine percent of public high schools reported offering some form of block scheduling that allows for longer class periods (table 40; figure 21). About one in five public high schools offered career majors or school-based enterprises to their students.
- Among public high schools, 28 percent reported having skill standards, 20 percent reported offering skill certificates, and 20 percent occupational certificates (table 41). Large schools and urban schools were more likely than small and rural schools to offer these types of standards and certificates. Also, schools with higher percentages of minority students were more likely to have skill certificates and standards. For example, 51 percent of high-minority schools (those with more than 75 percent minority students) had skill standards.

## WORK EXPERIENCE AND WORK-BASED LEARNING

Most public high school graduates work during their senior year of high school, although most of these students work part time. ${ }^{68}$ In addition to student-found employment, many schools offer work-based learning experiences, with cooperative education being the most common form of work-based learning, followed by job shadowing, internships, and mentoring. Although participation in occupational education decreased between 1982 and 1994, the percentage of public high school graduates earning cooperative education credits increased somewhat over the same time period. ${ }^{69}$ By 1994, about one in ten graduates participated in cooperative education.

- Most 1992 public high school graduates (71 percent) worked during their senior year of high school (table 42). Of these, most worked 20 or fewer hours per week. While vocational concentrators were only slightly more likely than college preparatory and other/general students to work during their senior year, they were significantly more likely than these two groups to work more than 20 hours per week. ${ }^{70}$

Table 42—Percentage distribution of 1992 public high school graduates according to their work status during their senior year in high school, by curriculum specialization in high school

| Curriculum specialization | Never worked | Any work | Hours worked |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | 20 or fewer hours | More than 20 hours |
| Total | 29.2 | 70.8 | 67.7 | 32.3 |
| College preparatory only | 31.8 | 68.2 | 79.9 | 20.1 |
| Vocational concentrators total* | 25.3 | 74.7 | 55.8 | 44.2 |
| Vocational concentration only | 24.5 | 75.5 | 53.8 | 46.3 |

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Education Longitudinal Study of 1988, Second Follow-up and High School Transcript Study.

[^49]- Between 25 and 50 percent of public high schools offered each type of work-based learning activity in 1997 (figure 22). Cooperative education and job shadowing were more prevalent than mentoring or internships, with 48 and 43 percent of public schools offering cooperative education and job shadowing, respectively, and 25 percent of public schools offering mentoring and 25 percent internships.

Figure 22—Percentage of public schools offering various work-based activities: 1997

NOTE: The sample is made up of public schools with a 12 th grade. Schools that were identified by school district officials as primarily vocational in nature were not included in the sampling frame.

SOURCE: U.S. Department of Labor, Bureau of Labor Statistics, National Longitudinal Survey of Youth, 1996-97.

- The percentage of public high school graduates taking cooperative education courses increased from 8.0 percent in 1982 to 9.4 percent in 1994 (table 43). Given that the average number of specific occupational credits earned by graduates decreased over the same period, this means that the share of occupationally specific credits that were cooperative education credits increased, from 3.5 percent in 1982 to 4.5 percent in 1994 (table 44).
- Vocational concentrators exhibited the highest rates of participation in cooperative education courses in all the years studied (tables 43 and 44). Twenty-three percent of vocational concentrators earned credits in this area in 1994, compared with 3 percent of college preparatory students and 6 percent of students completing general coursework in high school. Similarly, vocational concentrators earned a greater share of their specific occupational credits in cooperative education coursework than did college preparatory or other/general students in 1994.

- Both vocational concentrators and college preparatory students increased their cooperative education coursetaking between 1982 and 1994 (tables 43 and 44). While 15 percent of vocational concentrators completed cooperative education courses in 1982, 23 percent did so in 1994. Course completion rates for college preparatory students increased from less than 1 percent in 1982 to 3 percent in 1994. Both groups also increased their share of specific occupational credits earned in cooperative education coursework over the years studied. However, vocational concentrators increased their absolute and relative participation in cooperative education at a faster rate than did college preparatory students.
- In 1994, graduates earned more cooperative education credits in business and in marketing and distribution than in other program areas (table 45). The average number of cooperative education credits earned in these program areas remained relatively unchanged from 1982.
- The percentage of all graduates completing career preparation and general work experience courses that were not associated with a specific occupational program decreased from 17 to 13 percent between 1982 and 1994 (table 46).

## TECHNOLOGY LITERACY

The percentage of public high school graduates taking at least one computer education course increased substantially between 1982 and 1990, and then remained relatively steady through 1994. In that year, about 80 percent of graduates had completed at least one semester of computer education. Participation in the more traditional "industrial arts" declined over the 1982-1994 period, while participation in the newer "technology education" increased. However, it is not possible to determine from the available data the extent to which this shift reflects relabeling, rather than a change in course objectives or content. In 1994, fewer graduates completed coursework in the combined introductory technology fields than in 1982.

- The percentage of public high school graduates who completed at least one semester of computer education increased sixfold from 13 percent in 1982 to 78 percent in 1990, and then remained relatively constant between 1990 and 1994 (table 47)..$^{71}$

[^51]Table 45-Average number of Carnegie units accumulated by public high school graduates in cooperative education and work experience coursework in a specific occupational area: 1982, 1990, and 1994

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

- Although male and female graduates completed computer education coursework at similar rates in 1982, females were more likely than males to take such coursework in later years (table 47). In 1994, 85 percent of female graduates versus 75 percent of male graduates took at least one semester of computer education. By contrast, earlier differences among racial-ethnic groups in completing computer coursework disappeared in later years. In 1982, American Indians/Alaskan Natives and Hispanics were less likely
than other racial-ethnic groups to take at least one semester of computer education. ${ }^{72}$ In 1990 and 1994, however, all race-ethnicities completed computer education coursework at similar rates. For example, in 1994, between 75 and 81 percent of students in the different racial-ethnic groups completed at least one semester of computer education. ${ }^{73}$
- The percentage of public high school graduates completing at least one course in technology education jumped between 1990 and 1994, from 0.8 percent to 4.2 percent (table 48). The percentage in 1982 was 0.2 . Over the same period, the percentage of graduates completing at least one course in industrial arts declined from 14 percent in 1982 to 8 percent in 1994. Combining the more traditional industrial arts with the newer technology education, fewer graduates completed coursework in introductory technology fields in 1994 than in $1982 .{ }^{44}$
- Female public high school graduates were less likely than their male peers to complete introductory technology coursework in all years studied (table 48). In 1994, 3 percent of female graduates versus 20 percent of male graduates completed introductory technology coursework. In the same year, Asian/Pacific Islander graduates were less likely than white and black graduates to complete introductory technology coursework.

## VOCATIONAL TEACHERS

The available teacher trend data were for school years 1990-91 and 1993-94, and the changes noted were generally small for the 3-year period. However, these changes included a teaching force that grew older and accrued more years of teaching experience. This trend held for vocational and academic teachers alike.

Vocational and academic teachers were similar in a number of ways: about the same proportions held bachelor's degrees, and similar percentages held either standard or advanced certification. However, about 8 percent of vocational teachers had less than a bachelor's degree, in comparison with less than 1 percent of academic teachers. Also, vocational teachers were generally older than academic teachers, which may be due to the fact that vocational teachers entered the teaching profession at an older age, possibly after obtaining industry experience. There were

| Hispanic | 9.0 | 5.7 | 3.7 |
| White, non-Hispanic | 12.0 | 8.5 | 4.2 |

[^53]some variations among vocational teachers who taught in different program areas and school settings. For example, trade and industry and technical teachers and those teaching in more than one vocational field were generally least likely to have a bachelor's or advanced degree than other vocational teachers.

## Qualifications and Experience

- The educational attainment of vocational teachers as a group remained about the same in 1990-91 and 1993-94 (table 49). Although there was a small decrease in the percentage of teachers with a master's degree, the percentage of vocational teachers with a doctorate or first-professional degree increased slightly. ${ }^{75}$ In both 1990-91 and 1993-94, about 8 percent of vocational teachers had less than a bachelor's degree; 47 percent had a bachelor's degree; and the rest (about 45-46 percent) had some type of advanced degree.
- About the same proportion (47 percent) of vocational and academic teachers held bachelor's degrees as their highest degree in 1993-94 (table 49; figure 23). Vocational teachers were more likely to have less than a bachelor's degree ( 8.3 versus 0.5 percent), while academic teachers were more likely to have a master's or doctorate/firstprofessional degree.
- Educational attainment varied markedly by vocational program area. Trade and industry and technical teachers and those teaching in more than one vocational field were generally least likely to have a bachelor's or advanced degree in 1993-94 (table 49). About 39 percent of trade and industry teachers, 32 percent of "mixed" vocational teachers, and 16 percent of technical teachers held less than a bachelor's degree. ${ }^{76}$ This may reflect the practice in some states of counting industry experience in place of education in hiring some vocational teachers. ${ }^{77}$ In contrast, agriculture, business, career education, home economics, and industrial arts teachers were more like academic teachers in terms of their educational attainment, with less than 6 percent of these groups having less than a bachelor's degree. ${ }^{78}$

- Between the 1990-91 and 1993-94 school years, the percentage of vocational teachers whose highest degree was in the broad field of vocational education decreased slightly (by about 3 percent), while the percentage who had an occupationally specific degree increased by about the same amount (table 50). More than half ( 57 percent) of vocational teachers in 1993-94 held their highest degree in vocational education, while approximately equal percentages of vocational teachers (12-13 percent) held degrees in the specific occupational and general education fields.

- In 1993-94, vocational teachers as a group had accrued more years of teaching experience than in 1990-91 (table 51). In particular, the percentage of vocational teachers with 10-20 years of teaching experience decreased, while the percentage with more than 20 years of teaching experience increased. ${ }^{79}$ A similar trend was evident for academic teachers. ${ }^{80}$ About the same percentage of vocational and academic teachers ( 37 percent) had taught for more than 20 years by 1993-94.

[^56]
## Demographic Characteristics

- As might be expected, in addition to gaining more years of teaching experience, the teaching force aged somewhat between 1990-91 and 1993-94 (table 53). Specifically, while 62 percent of all teachers were age 40 or over in 1990-91, 69 percent were in this age group in 1993-94. This aging trend held for both vocational and academic teachers.
- In both school years surveyed, vocational teachers were generally older than academic teachers; however, as mentioned previously, they had similar years of teaching experience (table 53; figure 24). Vocational teachers may have been older than their academic peers because they began teaching at an older age, possibly after obtaining industry experience, or because they alternated teaching spells with other experiences.

- About half of academic and vocational teachers were male, and half female (table 54). This was true in both 1990-91 and 1993-94, with no significant change in the gender ratio between the 2 years. In both years, the percentage of vocational teachers who were black was greater than the percentage of academic teachers who were black (table 55). However, the percentage of vocational teachers who were black decreased slightly over the 3 -year period. ${ }^{82}$

## Professional Development Activities

Most teachers-vocational, academic, and special education alike-reported participating in some professional development activity during 1993-94. The professional development activities surveyed included district- and school-sponsored workshops or inservices, postsecondary coursework, professional association activities, and participation in various teaching-related committees. Vocational teachers were generally more likely than other teachers to seek professional development opportunities outside their school or district. This was particularly true for vocational teachers in a vocational school setting. This suggests that schools and districts, particularly vocational schools and the districts that oversee them, may be somewhat less successful at providing their vocational teachers with relevant professional development activities. Alternatively, it may be that these schools and districts offer fewer vocationally relevant activities directly, relying more on outside professional development providers.

- Most teachers (96 percent) reported participating in at least one type of professional development activity in 1993-94 (table 56; figure 25). This was true for both vocational and academic teachers. However, vocational teachers were twice as likely as other teachers to participate on a curriculum integration committee, and were more likely to participate in professional association activities and take adult education courses. Vocational teachers were slightly less likely than other teachers to participate in district-sponsored workshops.

- Most teachers (85 percent) participated in at least one type of inservice activity in 199394 (table 57). The activities surveyed included the following topics: educational technology, student assessment, cooperative learning, various methods of teaching in one's subject field, and an in-depth study in that subject field. Vocational teachers were more likely than other teachers to participate in workshops on the uses of educational technology and to report participating in an in-depth study in their subject field. ${ }^{83}$ However, vocational teachers were less likely than other teachers to participate in workshops on methods of teaching in their subject field.

to change their teaching practices. ${ }^{84}$ Vocational teachers were more likely than academic teachers to report that professional development activities provided new information and caused them to seek further information or training. Vocational teachers were less likely than their academic counterparts to report that professional development activities were a waste of time.

- Almost three-quarters (73 percent) of all teachers reported receiving some support for inservice or professional development activities (table 59). Types of support included release time, scheduled professional development time, travel and/or per diem expenses, tuition and/or fees, and professional growth credits. Vocational teachers were more likely than other teachers to report receiving travel and/or per diem support. This may be related to the fact that they were generally more likely than other teachers to seek professional development opportunities outside their school or district.

[^59]Vocational teachers reported different professional development experiences depending on their school setting:

- Vocational teachers in vocational schools were significantly less likely than vocational teachers in comprehensive high schools to participate in district-sponsored workshops and were more likely to take extension or adult education courses (table 56). ${ }^{85}$ Vocational teachers in comprehensive high schools were significantly less likely than other vocational teachers to have participated in a teaching induction program during their first year of teaching. These findings suggest that regular school districts may be somewhat less successful at meeting the professional development needs of their vocational teachers. It may also be that vocational schools or districts offer fewer activities directly, relying more on outside professional development opportunities.
- Vocational teachers in vocational schools were less likely than vocational teachers in comprehensive and other high schools to participate in inservices on the uses of educational technology, and more likely than these teachers to participate in an in-depth study in their subject field (table 57). ${ }^{86}$ This may be due to the different types of vocational programs that are typically offered in vocational and comprehensive schools. ${ }^{87}$ Alternatively, this may be due to the possibility of vocational teachers in vocational schools having greater industry experience before entering teaching. Two phenomena suggest that this may be true. First, vocational teachers in vocational schools tended to be older than vocational teachers in comprehensive high schools when they first began to teach (table 60). Second, they were also more likely than these teachers to have less than a bachelor's degree (table 60). ${ }^{88}$ As stated previously, some states count industry experience in place of education in hiring some vocational teachers. ${ }^{89}$

## V. Transitions After High School

## OVERVIEW

This chapter provides information on the postsecondary education and labor market experiences of public high school graduates. Postsecondary outcomes are presented before labor market outcomes, because, as discussed in Chapter II, postsecondary attainment contributes to labor market success. Two data sets were used in the analysis:

- High School and Beyond (HS\&B) Sophomore Cohort Second and Fourth Follow-up Surveys
- National Education Longitudinal Study of 1988 (NELS:88) Third Follow-up Survey

The first data set provides information on 1982 public high school graduates 2 and 10 years after their high school graduation, while the second provides information on 1992 public high school graduates 2 years after their graduation. Due to the comparable nature of the data sets, it was possible in this analysis to compare postsecondary and labor market trends 2 years after high school for 1982 and 1992 graduates, although some data elements available in NELS:88 were not present in HS\&B. Comparable long-term (10-year) outcomes for the 1992 cohort are obviously not yet available.

When making comparisons of postsecondary and labor market experiences for different groups of high school graduates, the same curriculum-based definitions used in the previous chapter were applied here:

Vocational concentrators completed 3.0 or more credits in a single occupational program area. ${ }^{00}$ These program areas include the following:

- agriculture and renewable resources
- business

[^61]- marketing and distribution
- health care
- public and protective services
- trade and industry
- technology and communications
- food service and hospitality
- child care and education
- personal and other services

College preparatory graduates completed a college preparatory course of study that was consistent with the prevailing entrance requirements at public 4 -year institutions. These included 4.0 credits in English; 3.0 credits in mathematics at the Algebra 1 level or higher; 2.0 credits in biology, chemistry, and/or physics; 2.0 credits in social studies with at least 1.0 credit in U.S. or World History; and 2.0 credits in a single foreign language.

Other/general students met neither of the above criteria.

Students who met both the vocational concentrator and college preparatory criteria were included in the vocational concentrators total in the tables and figures. Students who met only the vocational concentrator criteria, as well as the "both" group, were also reported separately. When examining post-high school outcomes, it is important to relate these outcomes to the particular paths that students took in high school. Consequently, in this chapter, outcomes for vocational concentrators who also completed a college preparatory curriculum (the "both" group) are sometimes compared with outcomes for vocational concentrators who did not meet the college preparatory criteria (referred to as "strictly vocational concentrators"). When the vocational concentrator group is divided into these two subgroups, the distinctions are made clear in the text, tables, and figures.

Readers are cautioned against interpreting the findings in this chapter as evidence of the causal impact of vocational education on student outcomes. These data are descriptive onlythey describe the post-high school experiences of students completing different courses of study in high school. They are not causal in the sense that participation in vocational education or the college preparatory curricula necessarily caused these outcomes. Factors that influenced students
to complete a particular course of study in high school may have a more direct impact on subsequent outcomes than participation in that course of study. For example, students whose parents have a bachelor's degree or higher may be more likely both to complete a college preparatory course of study in high school and to pursue and attain a bachelor's degree after high school. Attributing the finding that college preparatory students were more likely than other students to obtain a bachelor's degree within 10 years of graduating from high school to their having completed a college preparatory course of study is misleading. It is impossible in a descriptive analysis to determine the specific contribution of completing different courses to post-high school outcomes. In order to control for "selection bias" and isolate the impact of particular courses of study on subsequent outcomes, an experimental or quasi-experimental study would have to be performed.

## POSTSECONDARY OUTCOMES

The postsecondary education outcomes described in this section include both enrollment in a postsecondary institution after high school, postsecondary remedial coursework taken, and completion of a degree or certificate. The points 2 and 10 years after high school graduation are examined. Generally, the expressions "degree attainment" and "degree completion" used in the text refer to attainment of any postsecondary degree or certificate, not just degrees. The vast majority of the certificates referred to in this section are subbaccalaureate certificates, as opposed to 4 -year or post-baccalaureate certificates (such as some teaching credentials). ${ }^{91}$

## The Transition to Postsecondary Education: Two Years After High School

Within 2 years after graduating from public high school in 1992, about three out of every four students enrolled in a postsecondary institution. This indicates a marked increase in postsecondary enrollment rates from a decade earlier, when about half of 1982 public high school graduates enrolled in a postsecondary institution within 2 years of graduating. Between 1982 and 1992, postsecondary enrollment rates increased for vocational concentrators and students completing general coursework in high school, but not for college preparatory graduates. While the gap in enrollment rates among the three main curriculum-based groups appeared to be narrowing, 1992 vocational concentrators were still less likely than their college preparatory and other/general peers to enroll in a postsecondary institution within 2 years. However, vocational concentrators who also completed a college preparatory curriculum had enrollment outcomes that were more like those of their college preparatory peers than did strictly vocational concentrators.

[^62]Vocational concentrators were more likely than their other/general peers to obtain a degree or certificate within 2 years, despite the fact that the two groups enrolled at similar rates in community colleges and that vocational concentrators were more likely to be employed while in school.

- Fifty-seven percent of 1982 public high school graduates had enrolled in postsecondary education within 2 years of graduation, in contrast to 73 percent of 1992 graduates (tables 61 and 62). Both 1992 vocational concentrators and other/general students were more likely to enroll in postsecondary education within 2 years than their 1982 counterparts. Forty-two percent of 1982 vocational concentrators enrolled in postsecondary education, while 55 percent of 1992 vocational concentrators did so. Similarly, 61 percent of 1982 high school graduates who completed general coursework in high school pursued further education by 1984, while 69 percent of their 1992 counterparts enrolled in postsecondary education within 2 years of leaving high school. There was no significant difference in the postsecondary enrollment rates for college preparatory graduates over the decade studied.

- Among 1992 public high school graduates, vocational concentrators were less likely than their peers to enroll in a postsecondary institution within 2 years after completing high school (table 62). Specifically, about 55 percent of vocational concentrators had enrolled, compared with 93 percent of college preparatory students and 69 percent of other/general students. Vocational concentrators who also completed a college preparatory curriculum were about as likely to enroll in a postsecondary institution as their college preparatory peers ( 91 percent versus 93 percent). Patterns among the different curriculum-based groups were similar for 1982 public high school graduates (table 61).
- Among 1992 public high school graduates who enrolled in postsecondary education within 2 years of graduation, vocational concentrators were more likely to enroll in community colleges than were college preparatory graduates ( 50 versus 19 percent), but they enrolled in these institutions at rates that resembled those of other/general graduates (47 percent) (table 62). College preparatory graduates and vocational concentrators who also completed a college preparatory curriculum were more likely to enroll in 4-year postsecondary institutions than their strictly vocational and other/general peers. Patterns among the different curriculum-based groups were similar for 1982 public high school graduates (table 63). ${ }^{92}$
- Among those who enrolled in postsecondary education within 2 years of high school graduation in 1992, vocational concentrators were more likely to be employed than were their college preparatory peers, but were about as likely to be employed as other/general graduates (44 percent versus 17 percent and 38 percent, respectively) (tables 64 and 65; figure 26).
- Among 1992 public high school graduates who were employed as well as enrolled in postsecondary education 2 years later, those who were vocational concentrators in high school had a stronger work orientation than other students (table 64). About one quarter (26 percent) of postsecondary students who were vocational concentrators in high school identified themselves primarily as workers rather than as students. In comparison, 8 percent of postsecondary students who were college preparatory graduates and 22 percent of postsecondary students who were other/general graduates in high school considered themselves primarily as workers.

- Among 1992 public high school graduates who enrolled in postsecondary education within 2 years of completing high school, about 12 percent of vocational concentrators and 9 percent of other/general graduates had completed an associate's degree or certificate by 1994 (table 66). In contrast, 6 percent of college preparatory graduates had done so. Vocational concentrators were more likely than their other/general peers to obtain a degree or certificate within 2 years, despite the findings noted above that the two groups enrolled at similar rates in community colleges and that vocational concentrators were more likely to be employed while in school. Similar differences in rates of award completion were found among 1982 public high school graduates (table 67).

## The Transition to Postsecondary Education: Ten Years After High School

Initial indications are that long-term postsecondary enrollment rates have increased for public high school graduates over the decade from 1982 to 1992. About three-fourths of 1992 graduates enrolled in a postsecondary institution within 2 years of graduation, while two-thirds of 1982 graduates enrolled within a full 10 years after graduation. By the year 2002, the 10-year enrollment rate is likely to be even higher than 74 percent for 1992 graduates.

Among 1982 graduates, vocational concentrators were less likely than either their other/general or college preparatory peers to enroll in postsecondary education by 1992. However, vocational concentrators who also completed a college preparatory curriculum were about as likely as college preparatory graduates to enroll during this timeframe. Students who worked fewer than 15 hours per week during their senior year of high school were more likely to both enroll in postsecondary education and complete a postsecondary degree or certificate within 10 years than their peers who worked more hours.

- About two-thirds ( 68 percent) of 1982 public high school graduates enrolled in postsecondary education by 1992 (table 68; figure 27). Vocational concentrators were less likely than either their other/general or college preparatory peers to enroll within 10 years ( 54 percent versus 72 percent and 97 percent, respectively). However, vocational concentrators who also completed a college preparatory curriculum were about as likely as college preparatory graduates to enroll during this time frame ( 92 percent and 97 percent, respectively).

Figure 27—Percentage of 1982 public high school graduates who were enrolled in postsecondary education by 1992, by curriculum specialization in high school

*Includes students who completed both a vocational concentration and a college preparatory curriculum.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Fourth Follow-up Survey.

- Most 1982 public high school graduates ( 92 percent) who subsequently enrolled in postsecondary education did so within 3 years of high school graduation (table 69). Vocational concentrators were more likely than college preparatory graduates to delay their enrollment. Among graduates who enrolled within 10 years, 6 percent of vocational concentrators enrolled more than 5 years after high school graduation, compared with 0.2 percent of college preparatory graduates. However, most vocational concentrators (87 percent) enrolled within 3 years.

NOTE: Within 1 year indicates the percentage of 1992 high school graduates who enrolled in their first postsecondary institution from June 1983 to May 1984. Similarly, within 1-2 years suggests that the graduates enrolled in their first institution from June 1984 to May 1985. Percentages may not add to 100 due to rounding. Estimates appearing as 0.0 may be nonzero but less than 0.05 .

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Fourth Follow-up Survey.

- Enrollment rates for vocational concentrators varied by program area. For example, among those with a vocational concentration, concentrators in technology and communications and in business were more likely to enroll in postsecondary education within 10 years than concentrators in personal services and in trade and industry ( 81 percent and 64 percent, respectively, versus 37 percent and 47 percent, respectively) (table 70).
- Those 1982 public high school graduates who worked 15 or more hours per week during their senior year of high school were less likely than their counterparts working fewer than 15 hours per week to enroll in postsecondary education by 1992 (table 71). About 71-72 percent of graduates who worked fewer than 15 hours per week during their senior year enrolled in postsecondary education by 1992, compared with 65 percent of graduates who worked 15 to 34 hours per week and 55 percent of graduates who worked full time ( 35 or more hours per week). Readers are cautioned against interpreting this finding as evidence of the causal impact of working fewer hours on greater postsecondary enrollment. It may be that graduates working fewer than 15 hours per week were more likely for other reasons to enroll in college. For example, as discussed in Chapter IV, 1992 college preparatory graduates were significantly less likely than vocational concentrators to work part time during their senior year (table 42). They were also significantly less likely than other/general graduates to work part time. ${ }^{93}$
- Among 1982 public high school graduates who enrolled in postsecondary education by 1992, those who worked 15 or more hours per week during their senior year of high school were less likely than those working 1-14 hours per week to have earned a postsecondary degree (table 71 ). Specifically, 53 percent of graduates who worked 15 to 34 hours per week in high school and 43 percent of those who worked 35 or more hours per week obtained a degree within 10 years, compared with 61 percent of graduates who worked 1 to 14 hours per week.

## Remedial Coursework in Postsecondary Education

Among 1982 public high school graduates who enrolled in postsecondary education by 1992, students earned, on average, approximately one and a half remedial credits in postsecondary coursework. In general, vocational concentrators completed more remedial coursework than their peers. Postsecondary degree completers earned fewer remedial credits than their counterparts who enrolled in postsecondary education but did not earn a degree or certificate. Among postsecondary award holders, certificate and bachelor's degree completers earned fewer remedial credits than graduates completing an associate's degree. Comparing remedial coursework by type of degree or certificate is relevant, because vocational education policy has emphasized greater educational attainment in recent years.

- On average, 1982 public high school graduates who enrolled in postsecondary education by 1992 completed 1.4 remedial credits in postsecondary coursework (table 72; figure 28). Graduates completed most of this coursework in mathematics: 53 percent of all remedial coursework was in mathematics, compared with 9 percent in English and 38 percent in other areas.
- Vocational concentrators earned more remedial credits than other 1982 public high school graduates, although they were more like other/general graduates in terms of the amount of credits earned than like their college preparatory peers (earning 1.8 credits versus 1.4 and 0.6 credits, respectively) (table 72; figure 28). Vocational concentrators who also completed a college preparatory curriculum earned fewer remedial credits, on average, than their strictly vocational peers ( 1.0 credit versus 1.8 credits). ${ }^{94}$
- Among 1982 public high school graduates who enrolled in postsecondary education by 1992, vocational concentrators and other/general graduates took a greater proportion of their remedial coursework in mathematics than did college preparatory graduates ( 55 percent and 54 percent, respectively, versus 44 percent) (table 72 ).

[^67]Table 72—Average number of postsecondary remedial credits earned by 1982 public high school graduates by 1992, and of those earning remedial credits, percentage distribution according to subject of remedial credits, by curriculum specialization in high school

| Curriculum specialization | Total | Average number of remedial credits ${ }^{1}$ |  |  | Percentage of total remedial credits earned ${ }^{1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

*Includes students who completed both a vocational concentration and a college preparatory curriculum.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Fourth Follow-up Survey.

- Among 1982 public high school graduates who enrolled in postsecondary education by 1992, those attaining a postsecondary degree or certificate earned fewer remedial credits than those who did not attain a degree or certificate ( 1.2 credits versus 1.6 credits) (table 73). Although taking remedial coursework may slow students' progress toward a degree, students who take more remedial coursework may be less likely to obtain a degree in the first place. Perhaps this pattern exists because these students have lower educational aspirations or because they are more academically at risk.
- Among 1982 public high school graduates who enrolled in postsecondary education by 1992, those obtaining an associate's degree completed more remedial coursework than either certificate or bachelor's degree earners ( 2.2 credits versus 1.3 credits and 1.0 credits, respectively) (table 73). There may be several reasons why associate's degree holders complete more remedial coursework. Associate's degree programs may have stricter academic prerequisites than certificate programs; alternatively, associate's degree earners may complete more coursework overall than certificate earners. In addition,

Table 73-Average number of postsecondary remedial credits earned by 1982 public high school graduates by 1992, and of those earning remedial credits, percentage distribution according to subject of remedial credits, by degree attainment by 1992

| Degree attainment | Total | Average number of remedial credits* |  |  | Percentage of total remedial credits earned* |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Associate's degree | 2.16 | 0.20 | 1.18 | 0.78 | 8.3 | 55.0 | 36.7 |
| Bachelor's degree or higher | 0.99 | 0.09 | 0.49 | 0.41 | 9.0 | 49.8 | 41.3 |

*Averages are for all 1982 public high school graduates, while percentages are for those graduates earning postsecondary remedial credits.
NOTE: Averages may not add to totals and percentages may not add to 100 due to rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Fourth Follow-up Survey.
associate's degree earners may be less academically prepared than students who pursue a bachelor's degree; alternatively, 2-year institutions may be more likely to offer remedial coursework than 4-year institutions.

## Postsecondary Completion 10 Years After High School

More than half of 1982 public high school graduates who enrolled in postsecondary education completed a degree or certificate by 1992. Vocational concentrators had lower postsecondary completion rates overall than their peers. However, vocational concentrators who also completed a college preparatory curriculum were as likely as college preparatory graduates to earn a postsecondary degree during this period. Among graduates who enrolled in postsecondary education by 1992, vocational concentrators were less likely than their peers to earn a bachelor's degree, but more likely to obtain a certificate or an associate's degree.

- Among 1982 public high school graduates who enrolled in postsecondary education after high school, 56 percent completed a degree or certificate within 10 years (table 68; figure 29). Vocational concentrators had lower postsecondary completion rates than their college preparatory and other/general peers ( 48 percent versus 77 percent and 56 percent, respectively). Vocational concentrators who also completed a college preparatory curriculum were as likely as college preparatory graduates to earn a postsecondary degree during this period ( 81 percent versus 77 percent).
- Among 1982 public high school graduates who enrolled in postsecondary education by 1992, vocational concentrators were more likely than both college preparatory and other/general graduates to complete a certificate ( 13 versus 2 and 7 percent, respectively) or an associate's degree ( 13 versus 6 and 10 percent, respectively), and less likely to complete a bachelor's degree ( 22 versus 69 and 39 percent, respectively) (table 68). Again, vocational concentrators who also completed a college preparatory curriculum in high school exhibited rates of certificate and degree completion that were similar to those of their college preparatory peers.

Figure 29—Percentage of 1982 public high school graduates who were enrolled in postsecondary education according to their attainment status by 1992, by curriculum specialization in high school

*Includes students who completed both a vocational concentration and a college preparatory curriculum.
SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Fourth Follow-up Survey.

- Among 1982 public high school graduates who enrolled in postsecondary education by 1992, most associate's degree and certificate earners obtained their awards in vocational rather than academic areas (table 74). Almost two-thirds ( 63 percent) of associate's degree earners and virtually all ( 99 percent) of certificate earners obtained their awards in vocational areas.

## LABOR MARKET OUTCOMES

The labor market outcomes described in this section include participation in the labor force, employment and unemployment rates, and earnings. The points 2 and 10 years after high school graduation are examined.

Table 74—Percentage distribution of 1982 public high school graduates who earned an associate's degree and/or a certificate by 1992 according to postsecondary program, by curriculum specialization in high school

| Curriculum specialization | Associate's degree |  |  |  | Certificate |  |  | Associate's degree or certificate |  |  |  |

## Labor Market Outcomes 2 Years After High School

Labor market experiences 2 years after leaving high school were similar for the graduating classes of 1982 and 1992. In both cases, about three out of four public high school graduates were in the labor force. Vocational concentrators in both graduating classes were more likely than their college preparatory peers to be in the labor force 2 years after graduation. While 1992 public high school graduates had similar labor market experiences regardless of their course of study in high school, 1982 college preparatory graduates tended to have lower unemployment rates than their vocational concentrator and other/general peers. This difference may be due to changes over the decade in economic conditions or in the academic preparation of high school graduates, or other factors.

- Among 1992 public high school graduates, vocational concentrators and graduates completing general coursework in high school were more likely to be in the labor force in December 1993 than were their college preparatory peers ( 83 percent and 80 percent versus 63 percent, respectively) (table 75). Among labor force participants, all curriculumbased groups had similar employment and unemployment rates. Although vocational concentrators who also completed a college preparatory curriculum appeared to have a lower unemployment rate than that of other groups, the differences were not statistically significant.

Table 75—Percentage distribution of 1992 public high school graduates according to their employment status in December 1993, by curriculum specialization and work experience in high school

| Curriculum specialization <br> and work experience | In labor force | Of those in labor force |  |
| :--- | :---: | :---: | :---: |
| Total | 75.5 | Employed | Unemployed |
|  |  | 91.4 | 8.6 |
| Curriculum specialization in high school |  |  |  |
| College preparatory only | 63.4 | 91.4 | 8.6 |
| Vocational concentrators total* | 82.8 | 93.3 | 6.7 |
| Vocational concentration only | 84.4 | 93.0 | 7.0 |
| Both vocational concentration |  |  |  |
| and college preparatory | 73.3 | 95.6 | 4.4 |

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Education Longitudinal Study of 1988, Third Follow-up and High School Transcript Study.

- Among 1982 public high school graduates, vocational concentrators were more likely to be in the labor force in February 1984 than were either their other/general or college preparatory counterparts ( 81 percent versus 71 percent and 59 percent, respectively) (table 76). Among labor force participants, vocational concentrators and other/general graduates had higher unemployment rates than those of their college preparatory peers ( 7 percent and 6 percent, respectively, versus 2 percent). This contrasts with the experience of 1992 public high school graduates when all groups had statistically similar unemployment rates one and a half years after graduation. This difference may be due to changes over the decade in economic conditions or in the academic preparation of high school graduates, or other factors.
- Among 1992 vocational concentrators who were in the labor force in December 1993, unemployment rates appeared to vary by vocational program area (table 77). Specifically, graduates who concentrated in technology and communications, agriculture, and trade and industry appeared to have higher unemployment rates than those in marketing and distribution, health care, occupational home economics, and business. However, these differences were not statistically significant. ${ }^{95}$
- Among 1982 and 1992 public high school graduates who were in the labor force 2 years after graduation, those with no work experience in high school had higher unemployment rates than those with part-time work experience, but they had similar unemployment rates as those employed full time in high school ${ }^{96}$ (tables 75 and 76).

[^68]Table 76-Percentage distribution of 1982 public high school graduates according to their employment status in February 1984, by curriculum specialization and hours worked per week in high school

## Labor Market Outcomes 10 Years After High School

Vocational concentrators and other/general students had similar labor market experiences 10 years after graduation from high school. While the number of months employed and unemployed was similar regardless of one's course of study in high school, college preparatory graduates tended to enjoy higher earnings in 1991 than their peers, possibly because of their greater postsecondary attainment. Obtaining a bachelor's degree was generally associated with increased earnings and lower unemployment rates. At the other end of the educational spectrum, students who earned a postsecondary certificate had similar annual earnings and unemployment rates as their peers who did not complete a postsecondary degree or certificate. Furthermore, both postsecondary certificate and high school diploma holders earned less and were more likely to be unemployed in 1991 than graduates who earned an associate's degree or higher.

- During 1991, 1982 public high school graduates spent, on average, 11 out of 12 months, or 91 percent of their time, in the labor force (table 78). These figures were basically the same regardless of graduates' course of study in high school. Among labor force participants, the percent of time spent unemployed was also similar regardless of course of study in high school.
- Among 1982 public high school graduates who were in the labor force, percent of time spent unemployed during 1991 decreased as postsecondary attainment increased (table 79). Specifically, percent of time unemployed for graduates without a postsecondary degree or certificate was 6 percent, while the percent of time unemployed for graduates with a certificate, associate's degree, and bachelor's degree was 4 percent, 3 percent, and 3 percent, respectively.
- For 1982 public high school graduates who were in the labor force, work experience in high school was inversely related to percent of time spent unemployed 10 years later (table 79). In particular, the percent of time in the labor force spent unemployed during 1991 decreased steadily as the number of hours graduates worked per week in high school increased—ranging from 5 percent of time spent unemployed for those with no work experience to 3 percent for those with full-time employment ( 35 or more hours per week) during high school.

Table 78—Average number and percentage distribution of months according to employment status in 1991 for 1982 public high school graduates, by curriculum specialization in high school

| Curriculum specialization | Average number of months |  |  | Percent of months |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | In labor force |  | Not inlabor force | In labor force | Percent of time in labor force |  |
|  | Employed | Unemployed |  |  | Employed | Unemployed |
| Total | 10.43 | 0.52 | 1.05 | 91.3 | 95.2 | 4.8 |

- Among 1982 vocational concentrators who were in the labor force in December 1991, unemployment rates appeared to vary by vocational program area (table 80). For example, graduates who concentrated in technology and communications, trade and industry, and agriculture appeared to have lower unemployment rates than concentrators in most other fields and graduates who concentrated in health care appeared to have a higher unemployment rate than concentrators in other fields. However, these differences were not statistically significant; there were small sample sizes and large standard errors for these groups. This finding was similar to that for 1992 graduates 2 years after high school graduation.
- Among 1982 public high school graduates, college preparatory graduates had higher annual earnings in 1991 (about $\$ 26,500$ ) than those of their vocational concentrator and other/general peers, who earned approximately the same amount (about \$22,000) (table 81; figure 30). In 1991, vocational concentrators who also completed a college preparatory curriculum appeared to earn, on average, about $\$ 3,000$ more during the year than both their strictly vocational and other/general peers. However, these differences were not statistically significant. Vocational concentrators who also completed a college preparatory curriculum had a small sample size and large standard errors.

- Among 1982 public high school graduates, men spent more time in the labor force in 1991 than did women ( 11.6 months versus 10.4 months) (tables 82a,b). Female 1982 graduates also spent a greater percent of their time in the labor force unemployed in 1991 than did male graduates ( 7 percent versus 3 percent). Male vocational concentrators were similar to male college preparatory and other/general graduates in terms of labor force participation rates and percent of time in the labor force spent unemployed. Among female graduates, there were no significant differences in labor force participation rates between vocational concentrators and college preparatory and other/general graduates. Although female vocational concentrators appeared to spend almost twice as much of their time in the labor force unemployed as female college preparatory graduates, this difference was not statistically significant. ${ }^{97}$

- On average, male 1982 public high school graduates earned about \$25,500 in 1991 (table 83). Among these male graduates, college preparatory graduates had higher earnings (about $\$ 30,000$ ) than vocational concentrators and other/general graduates, who earned about the same amount (about $\$ 25,000$ ). In comparison, female 1982 public high school graduates earned, on average, about $\$ 19,500$ in 1991. Among these female graduates, vocational concentrators earned the least (about $\$ 18,000$ ), followed by other/general graduates (about $\$ 20,000$ ). Female college preparatory graduates enjoyed the highest annual earnings (about $\$ 23,000$ ).

- Among 1982 public high school graduates, annual earnings in 1991 increased with degree attainment (table 84). Specifically, graduates with no postsecondary degree or certificate and those with a postsecondary certificate earned about $\$ 21,000$, and associate's degree holders $\$ 23,000$, while bachelor's degree holders earned $\$ 27,000$. Obtaining a postsecondary certificate did not increase earnings measurably over holding a high school diploma for this graduating class.

# VI. Trends in Postsecondary Vocational Education 

## OVERVIEW

This chapter describes trends in participation in postsecondary vocational education from 1990 to 1996. The data sets used in the analysis include the following:

- Current Population Surveys (CPS) of 1990, 1991, 1994, and 1996, October supplements (describing adults in the general U.S. population) ${ }^{98}$
- National Postsecondary Student Aid Studies (NPSAS) of 1990 and 1996 (describing students enrolled for credit in postsecondary institutions) ${ }^{99}$
- Beginning Postsecondary Students (BPS) Longitudinal Survey of 1990, Base Year through Second Follow-up (describing outcomes for students enrolled for credit in postsecondary institutions for the first time in 1989-90, 4 years later in 1994)

The first set of surveys (CPS) provides an overview of the postsecondary attainment status of adults aged 18-64 in the general U.S. population and their recent participation in postsecondary education. The second set of surveys (NPSAS) forms the foundation of the trend analysis in this chapter. NPSAS contains information on a representative sample of all students enrolled for credit in postsecondary institutions during the surveyed year. It does not include students taking not-for-credit "adult" or "continuing" education courses; nor does it include transcript data. The survey relies instead on information from student self-reports and from institutional records about the degrees and majors students are pursuing, among other factors. The BPS survey provides longitudinal data on students who were enrolled for credit for the first time in 1989-90. In particular, the survey provides information on postsecondary enrollment and completion and some labor market outcomes as of 1994, relying on student self-reported information. Because recent postsecondary transcript data were not available for this analysis, the information on trends at the postsecondary level is generally less detailed than that at the secondary level. ${ }^{100}$

[^72]Specifically, it was not possible to examine students' actual course-taking patterns in this chapter.

Because of the federal definition of vocational education, the analysis in this chapter focuses primarily on subbaccalaureate students, based on student reports of the degrees they were pursuing at the time of the survey. ${ }^{101}$ Undergraduate students who reported that they were pursuing either an associate's degree or certificate, or were not in a degree program, were included in the analysis. ${ }^{102}$ In addition, data on major field were collected directly from NPSAS students and from their institutional records; these data were then coded into categories (about 100 categories for the 1995-96 survey and about 50 categories for the 1989-90 survey). In order to classify students as either "academic" or "vocational" for comparative analysis, these fields were collapsed using the taxonomy provided in figure 2 in the Introduction. All reported majors were classified as either academic or vocational. Students for whom major field information was not known were placed in a category called "major not reported." ${ }^{103}$

Unlike at the high school level, vocational education at the postsecondary level is provided extensively by both public and private institutions. In total, six types of postsecondary institutions are included in the analysis in this chapter:

- public 4-year institutions
- public 2-year institutions (sometimes referred to as "community colleges")
- public less-than-2-year institutions (sometimes referred to as "vocational-technical institutes")
- private, not-for-profit 4-year institutions
- private, not-for-profit 2-year institutions (which includes all private, not-for-profit less-than-4-year institutions)
- private, for-profit institutions

[^73]The designation "4-year" means that the institution awards bachelor's or graduate degrees as its highest degree type. The designation "2-year" means the institution awards associate's degrees or less-than-4-year, subbaccalaureate certificates as its highest award type. The designation "less-than-2-year" means that the institution does not award degrees but awards subbaccalaureate certificates of less than 2 years in length. Private, for-profit institutions usually offer certificates but may offer other degrees as well.

## TRENDS IN EDUCATIONAL ATTAINMENT

The United States has experienced both greater educational participation and higher attainment in recent years, continuing long-standing patterns. More people are attending postsecondary institutions than ever before, and the average educational attainment of the adult population (those 18 and older) has been steadily rising.

- The average educational attainment of the adult U.S. population (those 18 and older) increased between 1992 and 1996 (table 85; figure 31). The number of adults with less than a high school diploma decreased by 5 percent (about 2 million people) from 1992 to

Table 85—Percentage distribution and number of adults aged 18 or older according to highest educational attainment: 1992 and 1996

|  | Of all adults 18 or older |  |  |  | Of those who completed a degree* |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Less than <br> high school | High school only | Some college, no degree* | College degree* | Associate's |  |  | Bachelor's |  |
| Total percentage of adults | 19.4 | 35.3 | 18.8 | 26.5 | 1992 24.2 | 13.5 | 10.7 | 50.8 | 25.0 |
| Total number of adults (in 1000s) | 36,043 | 65,505 | 34,863 | 49,060 | 11,864 | 6,628 | 5,235 | 24,932 | 12,265 |
| Total percentage of adults | 17.6 | 33.8 | 19.8 | 28.9 | 1996 24.1 | 12.5 | 11.6 | 52.0 | 23.9 |
| Total number of adults (in 1000s) | 34,089 | 65,349 | 38,233 | 55,815 | 13,431 | 6,977 | 6,455 | 29,036 | 13,347 |

*The surveys did not ask specifically about postsecondary certificate completion. It is, therefore, not possible to know whether adults completing a postsecondary certificate, but not an associate's or higher degree, include themselves in the "some college, no degree" or "college degree" category.

NOTE: Percentages may not add to 100 due to rounding.

1996. In contrast, the number of adults with some college education increased by 10 percent (about 3 million people), and the number of those who earned a college degree increased by 14 percent (close to 7 million additional people). ${ }^{104}$ These changes should be viewed in the context of an overall population increase of about 4 percent during the same time period.

- Among adults who completed a college degree, the percentage who held associate's degrees remained fairly steady at about 24 percent between 1992 and 1996 (table 85). While there appeared to be a small increase in the total number of adults who earned vocational associate's degrees, this difference was not statistically significant. However, the total number of adults who held academic associate's degrees increased between 1992 and 1996 by approximately an additional 1 million people.

[^74]- In 1996, slightly more men than women had completed a college degree ( 30 percent versus 28 percent) (table 86). This difference was due to a higher proportion of men having bachelor's or advanced degrees. Women, on the other hand, were somewhat more likely than men to have earned an associate's degree ( 8 percent versus 6 percent). This gender gap held for both academic and vocational associate's degrees.
- Educational attainment differed by race-ethnicity in 1996. For example, substantial differences appeared in the proportion of adults completing a college degree, with 32 percent of whites, 19 percent of blacks, and 14 percent of Hispanics doing so (table 86). ${ }^{105}$ Differences were modest in 1996 in terms of the percentages of adults who had earned associate's degrees: 8 percent of whites, 6 percent of blacks, and 4 percent of Hispanics had this level of attainment. ${ }^{106}$

Table 86-Percentage distribution of adults aged 18 or older according to highest educational attainment, by sex and race-ethnicity: 1996

| Sex and race-ethnicity | Of all adults 18 or older |  |  |  | Of those who completed a degree ${ }^{1}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Less than high school | High <br> school <br> only | Some college, no degree ${ }^{1}$ | College degree ${ }^{1}$ | Associate's |  |  | Bachelor's | Master's or higher |
|  |  |  |  |  | Total | Vocational | Academic |  |  |
| Total | 17.6 | 33.8 | 19.8 | 28.9 | 6.9 | 3.6 | 3.3 | 15.0 | 6.9 |
| Sex |  |  |  |  |  |  |  |  |  |
| Male | 17.5 | 32.6 | 19.6 | 30.2 | 6.2 | 3.2 | 3.0 | 15.8 | 8.3 |
| Female | 17.7 | 34.9 | 19.9 | 27.6 | 7.6 | 4.0 | 3.7 | 14.3 | 5.6 |
| Race-ethnicity ${ }^{2}$ |  |  |  |  |  |  |  |  |  |
| Black, non-Hispanic | 23.8 | 36.2 | 21.5 | 18.5 | 5.5 | 2.6 | 2.9 | 9.1 | 3.8 |
| Hispanic | 43.8 | 28.0 | 14.5 | 13.6 | 4.4 | 2.3 | 2.1 | 6.7 | 2.6 |
| White, non-Hispanic | 13.5 | 34.6 | 20.2 | 31.7 | 7.5 | 4.0 | 3.5 | 16.6 | 7.7 |

${ }^{1}$ The surveys did not ask specifically about postsecondary certificate completion. It is, therefore, not possible to know whether adults completing a postsecondary certificate, but not an associate's or higher degree, include themselves in the "some college, no degree" or "college degree" category.
${ }^{2}$ Non-Hispanic adults who are neither black nor white are included in the total row but not shown separately.

[^75]
## TRENDS IN POSTSECONDARY ENROLLMENT

Vocational coursework is a substantial component of subbaccalaureate students' education. Among all subbaccalaureate students, about one-half majored in a vocational program area in 1996; the proportion decreased from 54 to 49 percent over the 6 years from 1990 to $1996 .{ }^{107}$

Although postsecondary enrollments overall have shown recent increases, there is no evidence that bachelor's degree holders are returning in large numbers for additional undergraduate schooling, as some have speculated. In particular, small proportions of students who were pursuing associate's degrees or certificates had already earned a bachelor's or advanced degree. The vast majority of students who enroll in postsecondary education are pursuing a higher level credential than the one they currently possess. However, this report focused on students participating in for-credit postsecondary programs. It may be that a significant number of bachelor's degree holders are taking noncredit, "adult" or "continuing" education courses.

There was an increase between 1990 and 1996 in the proportion of all vocational students being served by community colleges, with a corresponding decrease at private proprietary institutions.

- About 8 percent of adults age 18 and older in the United States were enrolled in postsecondary courses in October 1994, nearly all of them working toward a degree (94 percent) (table 87). About 4 percent of enrolled adults were working toward a license, diploma, or certificate; 22 percent toward an associate's degree; and 68 percent toward a bachelor's or advanced degree. ${ }^{108}$
- In 1994, the 22 percent of postsecondary students who were seeking an associate's degree were split about evenly between vocational and academic majors (table 87). The percentage of adults seeking a vocational associate's degree declined somewhat since 1991, from about 14 to 11 percent, while the percentage seeking an academic associate's degree rose from 9 to 11 percent.

- About one-half of all subbaccalaureate students reported majoring in a vocational field in 1995-96 (figure 32). The proportion of all subbaccalaureate students who declared a vocational major decreased slightly, from 54 percent in 1989-90 to 49 percent in 1995-96 (table 88). ${ }^{109}$

[^77]- In 1995-96, 20 percent of subbaccalaureate students held a previous postsecondary degree or certificate, and 2 percent held a bachelor's or higher degree (table 89). Among community college students, 19 percent held a previous postsecondary degree or certificate, and 1 percent held a bachelor's or higher degree. Whether subbaccalaureate students had previously earned a baccalaureate degree did not differ by students' major: 2 percent of academic majors and 1 percent of vocational majors had bachelor's or advanced degrees. Among previous degree holders, certificate seekers were about twice as likely as associate's degree seekers to hold a bachelor's or advanced degree in 1995-96 ( 12 versus 6 percent). About one-third of subbaccalaureate students who were not pursuing a degree or certificate held a bachelor's or advanced degree in 1995-96. (Data on prior degrees earned are not available for 1989-90.)

- Public 2-year institutions served a greater proportion of all subbaccalaureate students in 1995-96 than in 1989-90 (79 percent versus 67 percent) (table 90). This was true for each major field category (vocational, academic, and not reported). About 60 percent of students with vocational majors attended community colleges in 1989-90, for example, while 71 percent of them did so in 1995-96. There was a corresponding decline in attendance at private, for-profit schools: 16 percent of subbaccalaureate vocational students attended this type of school in 1995-96, down from 23 percent 6 years earlier.

## STUDENT CHARACTERISTICS

Subbaccalaureate students with vocational majors were older, more likely to have family responsibilities, more likely to receive financial aid, more likely to have a previous postsecondary degree or certificate, and reported higher postsecondary grade-point averages (GPAs) than their academic counterparts (figure 33). These students with vocational majors also tended to have parents with lower educational attainment: as the education level of their parents increased, students' likelihood of reporting a vocational major generally decreased. Differences by race-ethnicity among subbaccalaureate students in the probability of having a vocational major were either minimal or not statistically significant. Also, among subbaccalaureate students, there was no clear association between majoring in a vocational field and disability status.

- A slightly higher proportion of U.S. women than men were enrolled in postsecondary courses in 1994 ( 8 percent versus 7 percent) (table 87). Among those enrolled, women tended to be concentrated more in subbaccalaureate programs than men ( 29 percent versus 23 percent), and a higher percentage of women than men were earning vocational associate's degrees ( 12 percent versus 9 percent).
- Among subbaccalaureate students, about 58 percent of vocational majors were women in 1995-96, compared with 64 percent of academic majors (table 91). While subbaccalaureate males appeared to be slightly more likely than their female counterparts to report a vocational major in both 1989-90 and 1995-96, these small differences were not statistically significant (table 88).

Table 91—Percentage distribution of subbaccalaureate students according to sex, by major field category: 1995-96

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1995-96 National Postsecondary Student Aid Study.

- Subbaccalaureate students were more likely to have vocational than academic majors in 1995-96; this pattern held for all racial-ethnic groups except American Indian/Alaska Native students, where the sample size was small (table 92). The percentage within each racial-ethnic group (except black) that had a vocational major did not differ significantly from the overall total of 49 percent. ${ }^{110}$ About 58 percent of black students had a vocational major in 1995-96, a higher proportion than that of all subbaccalaureate students.
- Among black students, the likelihood of majoring in a vocational field decreased between 1989-90 and 1995-96 (table 92). While 68 percent of black students reported a vocational major in 1989-90, 58 percent of these students did so in 1995-96. For other racial-ethnic groups, the decrease was not statistically significant.

[^78]- Subbaccalaureate students with and without disabilities were equally likely to report a vocational major in 1995-96 (table 93). There was no change between 1989-90 and 1995-96 in the probability that subbaccalaureate students with and without disabilities had a vocational major. However, these estimates should be viewed with caution because of the high proportion of missing disability status data (45 percent missing data).

- Among subbaccalaureate students in 1995-96, vocational majors reported higher postsecondary GPAs than academic majors (table 94). For example, 24 percent of vocational majors reported GPAs of 3.5 or more in 1995-96, in contrast with 20 percent of academic majors. There were no consistent changes over time in the percentage of students with various GPAs who reported a vocational major.

- Students in their late 20s were more likely to report a vocational major in 1995-96 than those aged 20 or younger. In 1995-96, while 44 percent of students 20 years or younger reported a vocational major, about 54 percent of those ages $24-29$ did so (table 95). In 1995-96, 36 percent of vocational majors versus 26 percent of academic majors were 30 years or older (table 96 and figure 33). Between 1989-90 and 1995-96, the proportion of vocational students who were 20 or younger decreased, and the proportion who were 30 or older increased.

Table 95-Percentage distribution of subbaccalaureate students majoring in an academic, vocational, or unreported field, by age: 1989-90 and 1995-96

| Age | 1989-90 |  |  | 1995-96 |  |  |

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 and 1995-96 National Postsecondary Student Aid Study.

- Among subbaccalaureate students in 1995-96, vocational majors were more likely than academic majors to have a previous postsecondary degree or certificate (table 89 and figure 33). About 23 percent of vocational majors versus 17 percent of academic majors reported a previous postsecondary credential of some type.
- Among subbaccalaureate students in 1995-96, vocational majors were more likely than academic majors to receive financial aid (table 97 and figure 33). From 1989-90 to 1995-96, there was no significant change in the proportions of vocational majors receiving financial aid. In contrast, academic majors had a greater likelihood of receiving aid in 1995-96 than in 1989-90.

Table 97—Percentage distribution of subbaccalaureate students according to their financial aid status, by major field category: 1989-90 and 1995-96

|  | $1989-90$ |  |  | 1995-96 |  |
| :--- | :---: | :---: | :---: | :---: | :---: |

| Total | 38.1 | 61.9 |  | 40.7 | 59.3 |
|  |  |  |  |  |  |
| Vocational | 46.3 | 53.7 |  |  |  |
| Academic | 31.6 | 68.4 |  |  | 39.3 |
| Major not reported | 25.5 | 74.5 |  |  | 25.8 |

[^79]- Among subbaccalaureate students, higher proportions of vocational majors than academic majors had family responsibilities in both 1989-90 and 1995-96 (table 98). Vocational majors were generally more likely to be financially independent and to be married and/or have dependents (figure 33). These characteristics may be related to the older age of vocational majors. Between 1989-90 and 1995-96, the percentage of subbaccalaureate students who were unmarried with dependents (mainly single parents) more than doubled, from about 7 to 17 percent. This increase held for both vocational and academic majors.

Table 98—Percentage distribution of subbaccalaureate students according to their dependency and marital status, by major field category: 1989-90 and 1995-96

- As the education level of their parents increased, subbaccalaureate students were generally less likely to major in vocational fields, and were more likely to major in academic fields (table 99). For example, in 1995-96, 59 percent of subbaccalaureate students whose parents had a high school diploma but no postsecondary education reported a vocational major, compared with 35 percent of those whose parents had a graduate or professional degree.

Table 99—Percentage distribution of subbaccalaureate students majoring in an academic, vocational, or unreported field, by parental education: 1995-96

| Parental education | Academic | Vocational | Major not reported |

## SPECIFIC OCCUPATIONAL PREPARATION

This section examines student preparation in specific occupational program areas. Business, health, and technical fields continued to account for large numbers of vocational students' majors. However, between 1989-90 and 1995-96, there were small decreases in the proportion of subbaccalaureate students reporting majors in business, marketing, computers/data processing, and engineering/science technologies.

Among subbaccalaureate students, gender gaps persisted in the fields of business, health, and "other vocational" fields (where women predominated), as well as trade and industry, protective services, computers/data processing, and engineering/science technologies (where men predominated). A particularly large gap between men and women occurred in 1995-96 in engineering/science technologies, in which 12 percent of male students and only 2 percent of female students declared a major.

- Among subbaccalaureate students in 1995-96, popular vocational majors included business (about 14 percent of subbaccalaureate students reported this major); health (11 percent); and engineering/science technologies ( 6 percent) (table 100). Technical education as a whole, which includes computers/data processing, engineering/science technologies, and protective services, accounted for 12 percent of all subbaccalaureate majors.
- The percentage of subbaccalaureate students reporting majors in business, marketing, computers/data processing, and engineering/science technologies, declined significantly between 1989-90 and 1995-96 (table 100). Although percentages in other fields may appear to have changed, these differences were not statistically significant.
- Among subbaccalaureate students, gender gaps remained in 1995-96 in the following fields: business, health, and "other vocational" (where women predominated), as well as trade and industry, protective services, computers and data processing, and engineering/science technologies (where men predominated) (table 100 and figure 34). ${ }^{111}$ In particular, in engineering/science technologies, the ratio of male to female majors was about 7:1 in 1995-96. However, that difference was slightly smaller than in 1990, when the ratio was about 8:1.

## WORK EXPERIENCE WHILE ENROLLED

While many subbaccalaureate students were employed while they were enrolled in school, work experience that was directly related to coursework (such as internships, apprenticeships, or cooperative education) was relatively rare. In general, whether subbaccalaureate students had a vocational or academic major was not related to whether they worked in general or had a job linked to their schoolwork.

- Among subbaccalaureate students, working while enrolled in school was a very common practice. In both 1989-90 and 1995-96, about four in five students worked for pay at some point during the school year (table 101). Moreover, of those who worked for pay in 1995-96, 58 percent worked at least 35 hours a week, and 31 percent worked 20-34 hours a week. About 12 percent of subbaccalaureate students worked fewer than 20 hours a week. Students with vocational and academic majors were equally likely to have worked for pay in 1989-90, while in 1995-96, vocational majors were slightly less likely than academic majors to have worked for pay during the school year ( 77 versus 82 percent). However, among employed students in 1995-96, vocational majors were more likely than their academic peers to work 35 or more hours per week (figure 35).

Table 101—Percentage of subbaccalaureate students who worked while enrolled and, of those who worked, percentage distribution according to average hours worked per week, by major field category: 1989-90 and 1995-96

|  | Worked <br> for pay | Hours worked per week |  |  |

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1995-96 National Postsecondary Student Aid Study.

- Work experience that is connected to postsecondary coursework is uncommon. In 199596, about 8 percent of subbaccalaureate students reported participating in an internship, apprenticeship, or cooperative education during their postsecondary careers (table 102). Half of those participating had worked in internships. Vocational and academic students were equally likely to have had school-linked work experiences. (These data were not available for 1989-90.)
- Among students who first enrolled in postsecondary education in 1989-90 and were no longer enrolled in February 1994, a minority of vocational majors (13 percent) reported having at least one job while they were enrolled that was related to their studies (table 103). Vocational majors were no more likely than academic majors to have worked in a related job while they were enrolled. Students who had pursued a bachelor's degree were more likely to have had a related job than those seeking other degrees. (This difference may reflect the duration of a bachelor's degree program.)

Table 102-Percentage of subbaccalaureate students participating in various school-related work experience programs, by major field category: 1995-96

## POSTSECONDARY COMPLETION AND OTHER OUTCOMES

This section examines differences in postsecondary degree completion, licensure, and labor market outcomes. ${ }^{112}$ Among the group of students who first began their postsecondary studies in 1989-90, those with academic majors were more likely than students with vocational majors to have completed at least one postsecondary credential 4 years later. However, a majority of both academic and vocational majors completed some type of degree or certificate within 4 years. A large majority of beginning postsecondary students were employed 4 years later, and this was even more pronounced among those who were not enrolled in 1994. The likelihood of being employed did not differ between vocational and academic majors.

## Postsecondary Completion

- Educational aspirations were high among students beginning their postsecondary education in 1989-90. About one-third of those who declared either a vocational or an academic major in their first year planned to eventually earn a bachelor's degree, and an additional 37 percent of vocational majors expected to earn a graduate or professional degree (table 105). An even higher proportion, 58 percent, of first-year academic majors aspired to a graduate or professional degree. Long-term aspirations, the degree sought when enrolling for the first time, and one's major field (vocational or academic) may all influence the length of time it takes a student to attain a postsecondary credential. Indirectly, such factors may also influence employment outcomes.

[^83]Table 105—Percentage distribution of 1989-90 beginning postsecondary students according to their educational aspirations, by major field category and degree goal in 1989-90

| Major field category and degree goal | Highest level of education ever expected to complete |  |  |  |
| :---: | :---: | :---: | :---: | :---: |

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 Beginning Postsecondary Students Longitudinal Study, Second Follow-up, 1994.

- Half of beginning postsecondary students had attained at least one postsecondary credential by 1994 (table 107). Of those who received a credential, a little more than half earned bachelor's degrees; one-fourth earned certificates; and slightly less than onefourth earned associate's degrees.
- Beginning postsecondary students with an academic major were more likely than vocational majors to have attained a credential by 1994 ( 59 percent versus 52 percent) (table 107). In spring 1994, a minority of vocational and academic majors ( 36 percent and 24 percent, respectively) both were not enrolled and had not earned a degree (table 106). Among those who had completed a degree, vocational majors were more likely than academic majors to have earned a certificate, about equally likely to have earned an associate's degree, and less likely to have earned a bachelor's degree by 1994 (table 107).

- Among students who first began their postsecondary studies in 1989-90, there was little difference between certificate and bachelor's degree seekers in their likelihood of attaining a postsecondary credential within 4 years (table 107 and figure 36). However, those who began by pursuing a vocational associate's degree were less likely than other students to have earned a credential within 4 years. About 42 percent of vocational associate's degree seekers attained a degree or certificate in comparison with 57 percent of academic associate's degree seekers, 59 percent of bachelor's degree seekers, and 64 percent of certificate seekers.

Degree working toward in 1989-90

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 Beginning Postsecondary Students Longitudinal Study, Second Follow-up, 1994.

- Among students who first began their postsecondary studies in 1989-90, students pursuing an academic associate's degree were more likely than all other groups to transfer ${ }^{113}$ to a different postsecondary institution (58 percent did so) (table 108). Students seeking a certificate or license were least likely to transfer (19 percent did so). One in three students seeking a vocational associate's degree transferred. Of this last group, about half transferred to 4 -year institutions, and 77 percent to public institutions. Among all beginning postsecondary students, those who transferred were slightly less likely than nontransfer students to have attained a degree by 1994 ( 45 versus 52 percent) (table 107).

Table 108-Percentage distribution of 1989-90 beginning postsecondary students according to their transfer status in spring 1994 and, of those who transferred, type of destination institution, by selected student and institutional characteristics

## Licensure

Taking an occupational licensing exam was not very common among beginning postsecondary students. Those who started with a vocational major were no more likely to have taken a licensing exam by 1994 than those with an academic major. However, vocational majors were more likely to have taken a licensing exam in the business/finance, nursing, cosmetology/barbering, and engineering-related fields, while academic majors were more likely to have taken a teaching exam. Pass rates for licensing exams were generally high.

- A minority (14 percent) of students who first began their postsecondary studies in 198990 had taken an occupational licensing exam within 4 years (table 109). Students who began with a vocational or academic major were equally likely to have taken a licensing exam. Vocational majors were more likely to have taken a licensing exam in the business/finance, nursing, cosmetology/barbering, and engineering-related fields. Academic majors were more likely to have taken a licensing exam in the teaching field.

Table 109—Percentage of 1989-90 beginning postsecondary students who took an occupational licensing exam by 1994, and, of those who took at least one exam, percentage who took an exam in various fields, by major field category and degree goal

| Major field category and degree goal | Took a licensing exam | Type of licensing exam |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| No credential | 11.6 | - | - | - | - | - | - | - | - |

-Too few sample observations for a reliable estimate.
NOTE: Percentages in the last eight columns add to more than 100 because some students took exams in more than one field. Estimates appearing as 0.0 may be nonzero but less than 0.05 .

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 Beginning Postsecondary Students Longitudinal Study, Second Follow-up, 1994.

- The pass rates for licensing exams were quite high—generally at least 90 percent (table 110). The business/finance field appeared to be an exception, with an 81 percent pass rate. However, few students took licensing exams; sample sizes were small and differences between the rates for business and other fields were not statistically significant.

Table 110—Among 1989-90 beginning postsecondary students who took an occupational licensing exam, percentage who passed at least one exam by 1994, and the pass rate by occupational field

|  | Passed a licensing exam | Type of licensing exam |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Labor Market Participation

- Data on all adults 18 or older in the United States in 1996 indicate that both rates of employment and labor force participation rise with educational attainment. For example, in 1996, 39 percent of adults who had not completed high school were employed, while bachelor's or higher degree holders were employed at about twice that rate (table 111 and figure 37). Similarly, more than half of adults lacking a high school diploma were not in the labor force, compared with 19 percent of those with at least a bachelor's degree. The unemployment rate of those who had not completed high school was roughly five times that of bachelor's or graduate degree holders ( 10 percent versus 2 percent).

Table 111—Percentage distribution of all adults aged 18 years or older and of those in the labor force according to their employment status, by educational attainment: 1996

| Educational attainment | Of all adults |  |  | Of those in the labor force |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Employed | Unemployed | Not in labor force | Employed | Unemployed |
| Total | 65.1 | 3.2 | 31.8 | 95.3 | 4.7 |
| Less than high school completion | 39.4 | 4.4 | 56.2 | 90.0 | 10.0 |
| High school completion | 63.7 | 3.7 | 32.6 | 94.5 | 5.5 |
| Some college, no degree | 69.7 | 3.0 | 27.3 | 95.9 | 4.2 |
| Associate's degree | 77.5 | 2.6 | 20.0 | 96.8 | 3.2 |
| Bachelor's degree or higher | 79.6 | 1.7 | 18.7 | 97.9 | 2.1 |

NOTE: Percentages may not add to 100 due to rounding.

Figure 37-Percentage of labor force participants aged 18 years or older who were unemployed, by educational attainment: 1996

SOURCE: U.S. Department of Commerce, Bureau of the Census, October Current Population Survey, 1996.

- Among students who first began their postsecondary studies in 1989-90 and were no longer enrolled in the spring of 1994, about four-fifths had a job in February 1994 (table 112). The likelihood of being employed did not differ substantially for vocational and academic majors.
- Among employed respondents who first began their postsecondary studies in 1989-90 and were no longer enrolled in the spring of 1994, the most common occupations were clerical (about 25 percent), service/sales ( 22 percent), and managerial/computers (21 percent) (table 112). The level of institution in which students started their postsecondary studies was not related to their likelihood of having a job in spring 1994. However, the control of institution was relevant: those who enrolled initially at private, for-profit institutions, and were no longer enrolled 4 years later, were somewhat less likely to have a job. One explanation may be that private, for-profit institutions prepare their students less well for the labor market; alternatively, these institutions may enroll a higher proportion of students with low prior achievement than other types of schools.
- Among students who first began their postsecondary studies in 1989-90, those who were no longer enrolled in the spring of 1994 were more likely to be employed than those still enrolled ( 78 versus 65 percent) (tables 112 and 104). Enrolled students were somewhat more likely to be working in a service or sales job, while those no longer enrolled were more likely to hold a job in trade and industry (crafts, repair, labor, or machining).
- Among students who first began their postsecondary studies in 1989-90 and were no longer enrolled in the spring of 1994, a majority of vocational majors reported that in their most recent principal job they applied skills and used equipment or tools similar to the ones they used in school, and that they needed their postsecondary education to get that job ( 78 percent, 85 percent, and 58 percent, respectively, reported these work-school linkages) (table 103). About 70 percent of vocational majors reported that their first job after leaving postsecondary education was the same as their last job while enrolled.

Table 112-Percentage distribution of 1989-90 beginning postsecondary students who were not enrolled in 1994 according to their February 1994 employment status and of those employed, type of primary occupation in 1993, by selected student and institutional characteristics

| Selected student and institutional characteristics | Employment status in Feb. 1994 |  | Primary occupation in 1993 |  |  |  |  |  |

## THIS PAGE INTENTIONALLY LEFT BLANK

## VII. Conclusion

This publication describes vocational education at the turn of the century as an enterprise in transition. The traditional focus on preparing students for entry-level jobs after high school or subbaccalaureate postsecondary vocational training is giving way to a greater emphasis on academic preparation and preparing students for a wider range of career choices. The available data signal that change is occurring in the directions advocated by recent reform efforts, although such change is often small and preliminary. Evidence of change includes findings that the academic preparation of high school students participating in vocational education increased between 1982 and 1994; about half of public comprehensive high schools reported integrating academic and vocational education, and a similar proportion reported offering tech prep, by 1997; and over the decade from 1982 to 1992, postsecondary enrollment rates within 2 years of high school graduation increased for vocational concentrators.

This chapter revisits the key questions that were identified in the Executive Summary and expanded on in Chapter II, and summarizes the relevant findings.

## KEY QUESTIONS AND RELEVANT FINDINGS

## What are the major national economic and labor market trends and their implications for vocational education programs and policies?

The United States is shifting from a manufacturing- to a service- and information-based economy. These trends have two important implications for vocational education programs. They signal an ongoing shift in the education and training fields that are required of the U.S. work force as well as the levels of that education and training. The occupations with the highest projected growth rates are generally in the computer technology and health fields. Those with the highest projected increase in number of jobs are somewhat more varied, although they also include several health occupations. While the occupations with the highest projected growth rates have relatively high education and training requirements, those with the highest projected increase in number of jobs have relatively low education and training requirements. Implications are that some emerging occupations require high education and training requirements, while the majority of jobs still demand relatively low education and training levels. There is consensus in the research literature that there are trends toward greater education and training requirements
and a greater need for critical thinking, personal responsibility, and social skills among work force participants. However, these trends are not uniform across industries and occupations, and some disagree about their magnitude. Although researchers have long identified the association between increased educational attainment and better labor market outcomes, the disparity in incomes between those with more and less education has increased in recent years. Some argue that this means that education and training are increasingly crucial for narrowing the income gap and for preventing the creation of a society of haves and have nots. (Chapter II)

## What skills do employers value and how have skill requirements changed in recent years? Are employers implementing high-performance workplaces?

Employers do not rate years of completed schooling or academic performance as important as attitude and communication skills, when hiring front-line workers from among an established applicant pool. Nevertheless, most employers report that front-line skill requirements are increasing. There is evidence that some employers are transforming their firms into highperformance workplaces, with larger firms being more likely than smaller firms to undergo certain changes. These firms, however, are still in the minority. Both good critical-thinking and social skills are necessary in the decentralized and team-based environment of the highperformance workplace. However, the extent to which these practices will be implemented and these skills be required in the future is uncertain. (Chapter III)

## How large is the vocational education enterprise and is it growing, shrinking, or holding constant over time?

From 1982 to 1994, there was a general decline in the participation of high school students in vocational education. The percentage of public high school graduates taking at least one vocational education course decreased slightly. However, the decline in the percentage of graduates completing a sequence of related occupational courses was more dramatic. These decreases may be partly due to increases in high school graduation requirements implemented by many states after the publication of A Nation at Risk in 1983. As students have been required to take more academic coursework, they may have elected to take fewer vocational courses. (Chapter IV)

At the postsecondary level, vocational coursework is a substantial component of subbaccalaureate students' education. Among all subbaccalaureate students, about one-half majored in a vocational program area in 1996; the proportion decreased from 54 to 49 percent over the 6 years from 1990 to 1996. (Chapter VI)

## What types of and how much vocational education do students take and is this changing?

In particular, what are the trends in specific occupational preparation at the high school and postsecondary levels? Is there a shift from participation in traditional manufacturing programs (such as trade and industrial programs) toward service-sector and information-age programs (such as health and technology programs)?

Trade and industry and business were the most popular occupational programs in 1994about 8 percent of graduates concentrated in each of these areas. These were also the most popular programs in earlier years; however, the percentage of graduates concentrating in trade and industry, as well as the percentage concentrating in business, declined over the period studied. In 1982, about 15 percent of graduates had concentrated in trade and industry and 12 percent in business. In contrast, fewer students concentrated in health care and in technology and communications than in business and in trade and industry in all the surveyed years. However, the proportions of students who concentrated in health care and in technology and communications increased between 1982 to 1994 (from . 6 to 1 percent for health care, and from .5 to .9 percent for technology and communications). (Chapter IV)

At the postsecondary level, popular vocational majors in 1996 included business (about 14 percent of subbaccalaureate students reported this major); health (11 percent); and engineering/science technologies ( 6 percent). Technical education as a whole, which includes computers/data processing, engineering/science technologies, and protective services, accounted for 12 percent of all subbaccalaureate majors. However, between 1990 and 1996, there were small decreases in the proportion of subbaccalaureate students reporting majors in business, marketing, computers/data processing, and engineering/science technologies. (Chapter VI)

## Who participates in vocational education and is this changing?

In public high schools, although participation in the specific occupational curriculum declined for most groups of students between 1982 and 1994, there were a few exceptions to this trend. The percentage of black and Asian/Pacific Islander students concentrating in vocational education stayed about the same over this period, and the concentration rate of students with disabilities increased. In addition, the average number of specific occupational credits earned by blacks stayed about the same and increased for Asians/Pacific Islanders and students with disabilities. The increase in participation of students with disabilities is consistent with the emphasis of the 1990 Perkins Act on serving students with special needs. In all the surveyed years from 1982 to 1994, male students, students in rural schools, and students with lower grade-point
averages (GPAs) completed more specific occupational coursework and were more likely to be vocational concentrators than female students, students in urban and suburban schools, and students with higher GPAs. (Chapter IV)

At the postsecondary level, subbaccalaureate students with vocational majors were older, more likely to have family responsibilities, more likely to receive financial aid, more likely to have a previous postsecondary degree or certificate, and reported higher postsecondary gradepoint averages (GPAs) than their academic counterparts. These students with vocational majors also tended to have parents with lower educational attainment: as the education level of their parents increased, students' likelihood of reporting a vocational major generally decreased. Differences by race-ethnicity among subbaccalaureate students in the probability of having a vocational major were either minimal or not statistically significant. Unlike at the secondary level, there was no clear association between majoring in a vocational field and disability status among subbaccalaureate postsecondary students. (Chapter VI)

## Is the academic preparation of students who participate in vocational education improving over time?

In public high schools, the academic preparation of students participating in vocational education increased between 1982 and 1994, in both absolute and relative terms. While public high school graduates in general increased their course taking in the core academic subjects (English, mathematics, science, and social studies), the rate of increase over the period studied was greater for vocational concentrators than for either college preparatory or other/general students. However, in 1994, vocational concentrators still completed fewer total credits in each of the core academic subjects than did either college preparatory or other/general students. Vocational concentrators also generally increased the rigor of their academic coursework, particularly in mathematics, science, and social studies. (Chapter IV) Comparable data were not available at the postsecondary level.

## Are high school students enrolling in courses that teach technological skills?

The percentage of public high school graduates taking at least one computer education course increased substantially between 1982 and 1990, and then remained relatively steady through 1994. In that year, about 80 percent of graduates had completed at least one semester of computer education. Participation in the more traditional "industrial arts" declined over the 1982-1994 period, while participation in the newer "technology education" increased. However, it is not possible to determine from the available data the extent to which this shift reflects
relabeling, rather than a change in course objectives or content. In 1994, fewer graduates completed coursework in the combined introductory technology fields than in 1982. (Chapter IV)

## What is the role of work experience and work-based learning in students' courses of study?

Most public high school graduates work during their senior year of high school, although most of these students work part time. In addition to student-found employment, many schools offer work-based learning experiences, with cooperative education being the most common form of work-based learning, followed by job shadowing, internships, and mentoring. Although participation in occupational education decreased between 1982 and 1994, the percentage of public high school graduates earning cooperative education credits increased somewhat over the same time period. By 1994, about one in ten graduates participated in cooperative education. (Chapter IV)

At the postsecondary level, many subbaccalaureate students were employed while they were enrolled in school in 1995-96. However, work experience that was directly related to coursework (such as internships, apprenticeships, or cooperative education) was relatively rare. In general, whether subbaccalaureate students had a vocational or academic major was not related to whether they worked in general or had a job linked to their schoolwork. (Chapter VI) Among 1992 public high school graduates who were both employed and enrolled in postsecondary education 2 years after high school, those who were vocational concentrators in high school had a stronger work orientation than other students. About one quarter ( 26 percent) of postsecondary students who were vocational concentrators in high school identified themselves primarily as workers rather than as students, in comparison with 7 percent of college preparatory graduates and 21 percent of other/general graduates. (Chapter V )

The majority of employers with production employees who participated in work-based learning reported that these employees were superior to comparable new hires in terms of productivity and attitude. Virtually no employers reported that employees with work-based learning experience were inferior in these two respects to comparable new hires. (Chapter III)

## To what extent have recent vocational education reform efforts taken hold at the local level?

By 1997, public comprehensive high schools reported implementing some vocational edu-cation-related reforms, although the quality and specific forms of these efforts were not discernible from the available survey data. About half of these schools reported integrating academic and
vocational education, and a similar proportion reported offering tech prep. Fewer schools reported having block scheduling, career majors, school-based enterprises, skill standards, or skill or occupational certificates. Generally, schools with career academies and larger schools were more likely to report these reforms, while rural schools were less likely to do so. (Chapter IV)

## What are the trends in vocational teacher qualifications and experience over time?

The available teacher trend data were for school years 1990-91 and 1993-94, and the changes noted were generally small for the 3 -year period. However, these changes included a teaching force that grew older and accrued more years of teaching experience. This trend held for vocational and academic teachers alike. The educational attainment of vocational teachers as a group remained about the same over the 3-year period. About the same proportions of vocational and academic teachers held bachelor's degrees. However, about 8 percent of vocational teachers had less than a bachelor's degree, in comparison with less than 1 percent of academic teachers. There were some variations among vocational teachers who taught in different program areas and school settings. For example, trade and industry and technical teachers and those teaching in more than one vocational field were generally least likely to have a bachelor's or advanced degree than other vocational teachers. This may reflect the practice in some states of counting industry experience in place of education in hiring some vocational teachers. Similar percentages of vocational and academic teachers held either standard or advanced certification. A small percentage of vocational and academic teachers were teaching either without a credential or with a probationary, temporary, provisional, emergency, or alternative certificate. (Chapter IV)

## What are the postsecondary education outcomes associated with participation in vocational education?

In particular, are more students in secondary vocational education programs enrolling in and completing postsecondary education than in the past? Between 1982 and 1992, postsecondary enrollment rates increased for vocational concentrators and students completing general coursework in high school, but not for college preparatory graduates. While the gap in enrollment rates among the three main curriculum-based groups appeared to be narrowing, 1992 vocational concentrators were still less likely than their college preparatory and other/general peers to enroll in a postsecondary institution within 2 years. However, vocational concentrators who also completed a college preparatory curriculum had enrollment outcomes that were more like those of their college preparatory peers than did strictly vocational concentrators. With regard to completing postsecondary education, among 1982 public high school graduates who enrolled in
postsecondary education by 1992, vocational concentrators had lower postsecondary completion rates overall than their peers. However, vocational concentrators who also completed a college preparatory curriculum were as likely as college preparatory graduates to earn a postsecondary degree during this period. Among graduates who enrolled in postsecondary education by 1992, vocational concentrators were less likely than their peers to earn a bachelor's degree, but more likely to obtain a certificate or an associate's degree. (Chapter V)

Are more adults obtaining postsecondary vocational education credentials than before? The United States has experienced both greater educational participation and higher attainment in recent years, continuing long-standing patterns. More people are attending postsecondary institutions than ever before, and the average educational attainment of the adult population (those 18 and older) has been steadily rising. Among adults who completed a college degree, the percentage who held associate's degrees remained fairly steady at about 24 percent between 1992 and 1996. While there appeared to be a small increase in the total number of adults who earned vocational associate's degrees, this difference was not statistically significant. However, the total number of adults who held academic associate's degrees increased between 1992 and 1996 by approximately an additional 1 million people. The percentage of adults seeking a vocational associate's degree declined somewhat since 1991, from about 14 to 11 percent, while the percentage seeking an academic associate's degree rose from 9 to 11 percent. Among the group of students who first began their postsecondary studies in 1989-90, those with academic majors were more likely than students with vocational majors to have completed at least one postsecondary credential 4 years later. However, a majority of both academic and vocational majors completed some type of degree or certificate within 4 years. (Chapter VI)

## What are the labor market outcomes associated with participation in vocational education? How do these outcomes compare with other kinds of preparation?

Labor market experiences 2 years after leaving high school were similar for the graduating classes of 1982 and 1992. In both cases, about three out of four public high school graduates were in the labor force. Vocational concentrators in both graduating classes were more likely than their peers to be in the labor force 2 years after graduation. While 1992 public high school graduates had similar labor market experiences regardless of their course of study in high school, 1982 college preparatory graduates tended to have lower unemployment rates than their vocational concentrator and other/general peers. Vocational concentrators and other/general students had similar labor market experiences 10 years after graduation from high school. While the number of months employed and unemployed was similar regardless of one's course of study in high
school, college preparatory graduates tended to enjoy higher earnings in 1991 than their peers, possibly because of their greater postsecondary attainment. Obtaining a bachelor's degree was generally associated with increased earnings and lower unemployment rates. At the other end of the education spectrum, students who earned a postsecondary certificate had similar annual earnings and unemployment rates as their peers who did not complete a postsecondary degree or certificate. Furthermore, both postsecondary certificate and high school diploma holders earned less and were more likely to be unemployed in 1991 than graduates who earned an associate's degree or higher. (Chapter V)

## Appendix A-Standard Error Tables

This appendix provides estimates, standard errors, unweighted and weighted n's corresponding to most of the tables contained in the body of the report. Estimates take the form of either percentages or averages. Standard errors are abbreviated as "S.E." and represent a valuation of the deviation of the sample mean from the true population mean, or a measure of the accuracy of the estimate. The smaller the S.E., the more accurate the estimate. Unweighted n's represent the actual size of the survey sample on which the estimates and standard errors are based, while weighted n's represent projections of the size of the relevant population.

For example, in table A1 (corresponding to table 1 in the Introduction), the Total estimate for 1982 is 98.2 percent. The standard error associated with this estimate is 0.19 percent. The 98.2 percent figure was derived from data on a sample of 9,596 public high school graduates (the unweighted n) in the High School and Beyond Sophomore Cohort Second Follow-up Survey, while it is estimated that there were actually $2,606,000$ public high school graduates (the weighted n ) in 1982.

To estimate the number of persons in the population who meet certain criteria, you can apply percentage estimates (but not averages) to the weighted n's. Based on table A1, for example, you would estimate that $2,559,092$ (or 98.2 percent times $2,606,000$ ) public high school graduates in 1982 completed at least one vocational education course in high school. Furthermore, you could say with 95 percent confidence that the true population figure falls between 2,549,189 and 2,568,995 (or within 2 times the S.E. of 0.19 percent around the population estimate).

Table A1—Standard errors for table 1: Percentage of public high school graduates completing one or more courses in vocational education, by type of vocational education: 1982-94

| Vocational education type | 1982 | 1990 | 1994 |
| :--- | ---: | ---: | ---: |
|  |  |  |  |
| Total | 98.2 | 98.0 | 97.2 |

-Not applicable.
${ }^{1}$ In 1993-94, the "temporary" category also included "provisional" and "emergency" credential.
${ }^{2}$ In 1993-94, rather than including an "other" category, the survey asked about "alternative" and "advanced" credentials.
NOTE: Percentages may not add to 100 due to rounding. Row n's may not add to total n's because of missing data.

This section describes the data sources included in this publication.

## Beginning Postsecondary Students Longitudinal Study

The Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94) followed students from the 1989-90 National Postsecondary Student Aid Study (NPSAS:90) who were identified as first-time beginning students in academic year 1989-90. A computerassisted telephone interview (CATI) was conducted with these students in 1994, 4 years after the Base Year survey. The CATI system provides interviewers with screens of questions and guides the interviewer and respondent through the interview. The BPS:94 CATI collected information concerning enrollment, program completion, education financing, employment, and family formation; graduate school access and enrollment; and civic participation. The data derived from this survey permit a variety of analyses concerning postsecondary persistence and completion, entry into the work force, and civic participation.

The BPS sample was selected using a three-step procedure, with stratified samples and differential probabilities of selection at each level. First, postsecondary institutions were selected within geographic strata. Once institutions were organized by zip code and state, they were further stratified by control (i.e., public; private, not-for-profit; or private, for-profit) and degree offerings (less-than-2-year; 2- to 3-year; 4-year nondoctorate-granting; and 4-year doctorategranting). Within each stratum of institution type, institutions were sampled and then students within institutions were sampled. Students who were 1989-90 BPS respondents were then followed up in 1992 and again in 1994. Students who met either of the following criteria were designated as respondents to the 1994 survey: if they confirmed all schools attended during the intervening years, or if they provided their enrollment, employment, and postsecondary degree attainment status through February 1994. Among the eligible sample of students, the unweighted BPS:90/94 response rate is 91.4 percent. The weighted response rate, using the NPSAS:90 analysis weights, is 91.0 percent. Among respondents, about 10 percent of sample members did not have sufficiently detailed enrollment histories to allow for classification in the persistence variables. For more information on BPS:90/94, consult Beginning Postsecondary Students

Longitudinal Study Second Follow-up (BPS:90/94) Final Technical Report (NCES 96-153), Washington, DC: U.S. Department of Education, National Center for Education Statistics, 1996.

## Current Population Survey

The U.S. Census Bureau's Current Population Survey (CPS) collects household data on a monthly basis, primarily on labor force and demographic items. The October supplement to the basic CPS survey focuses on school enrollment and other education-related topics in detail; these data are collected for all household members age 3 or older. The CPS uses a sample of the civilian noninstitutional population of the United States; excluded from the population surveyed are members of the Armed Forces, inmates of correctional institutions, and institutionalized patients. CPS data files include information from approximately 60,000 households on about 110,000 people. Households in all 50 states and the District of Columbia are included. An adult member of the household (minimum age 15) serves as the respondent, providing information on all household members.

Approximately 729 sample areas and 1,973 counties, independent cities, and minor civil divisions are included in the stratified sampling frame. The samples are based on decennial census data, updated frequently to reflect new construction and demolition. The sampling design is revised regularly to improve data quality and reliability. For 1993 and roughly the preceding decade, the CPS samples were drawn from 1980 decennial census files. From 1994 on, the 1990 census was used as the basis for sampling and for weights; the 1990 census included adjustments for estimated undercounts of various groups. Also in 1994, the questionnaire for the CPS was redesigned, and the computer-assisted personal interviewing (CAPI) method of data collection was introduced. Standard errors for this report were estimated using generalized variance formulas, since the strata and PSU information are not available.

For additional information on the CPS and data it provides, refer to publications in the Current Population Reports series (Series P-20). Periodic reports under the title School EnrollmentSocial and Economic Characteristics of Students and Educational Attainment in the United States may be of particular interest.

## High School and Beyond

The High School and Beyond (HS\&B) longitudinal survey was first administered in 1980 to a stratified, nationally representative sample of approximately 30,000 high school sophomores and 28,000 high school seniors from more than 1,000 high schools. Follow-up surveys were administered in 1982, 1984, 1986, and 1992. This report uses data for the sophomore cohort from
the First, Second, and Fourth Follow-up Surveys (1982, 1984, and 1992) and the High School Transcript Survey. Smaller subsamples of the sophomore cohort were surveyed in 1984 and 1992. For purposes of this report, analysis samples were limited to public high school students by using the variable HSTYPE. This group was reduced further by including only public high school graduates. Graduation status was defined by using a composite of the graduation status variables RESNLEFT, FUSTTYPE, and SY12 from the Transcript, First Follow-up, and Second Followup surveys, respectively. Only those graduates who earned 16 or more Carnegie units in high school and a positive number of Carnegie units in English were included in the samples.

The First Follow-up and High School Transcript Survey were used to examine coursetaking patterns for 1982 public high school graduates. The analysis sample comprised 9,596 students. To explore the postsecondary enrollment patterns of 1982 public high school graduates in 1984, researchers used the Second Follow-up, resulting in an analysis sample of 5,984 students. Finally, the report analyzed the Fourth Follow-up data to investigate 1982 public high school graduates' postsecondary and labor market experiences 10 years after graduation in 1992. This final analysis sample comprised 6,787 students.

Standard errors were computed using the Taylor series approximation method. For further information on HS\&B, consult Calvin Jones et al., High School and Beyond Transcript Survey: 1982 Data File Users Manual, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, 1984. You may also speak to Aurora D'Amico at (202) 219-1365.

## High School Transcript Studies

Conducted in association with the National Assessment of Educational Progress (NAEP), the 1990 and 1994 High School Transcript Studies (1990 and 1994 HSTS) provided coursetaking and demographic information for a stratified, nationally representative sample of high school students. The 1990 HSTS collected transcript data for 21,531 seniors from 330 high schools, while the 1994 HSTS collected transcript data for 24,844 seniors from 340 high schools. Only public high school graduates who earned 16 or more Carnegie units in high school and a positive number of Carnegie units in English were included in each of the samples. The HSTS assigned a course identification code number, based on the Classification of Secondary School Courses (CSSC), to each course taken by a student. The 1998 Revision of the Secondary Schools Taxonomy further classified these CSSC codes into subject and program areas (see figure 1 in chapter I). This taxonomy served to standardize all of the transcripts included in the sample. Standard errors were computed using the Taylor series approximation method. For further information on the 1990 HSTS, see Stanley Legum et al., The 1990 High School Transcript Study, Final Technical Report, Washington, D.C.: National Center for Education Statistics, U.S.

Department of Education, December 1992. For further information on the 1994 HSTS, see Stanley Legum et al., The 1994 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1994, 1990, 1987, and 1982 High School Graduates, REVISED, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, September 1998. You may also speak to Janis Brown at (202) 208-0928.

## National Education Longitudinal Study of 1988

The National Education Longitudinal Study of 1988 (NELS:88) was a stratified, nationally representative sample of almost 26,000 students in the eighth grade from more than 1,000 public and private junior high schools in the United States. Follow-up surveys were administered in 1990, 1992, and 1994. The Second Follow-up "freshened" the sample to make it representative of students enrolled in the twelfth grade in the spring of 1992 by adding students who were not in the Base Year either because they were not in the country or because they were not in the eighth grade in the spring of 1992. This report used information from the Second and Third Follow-up Surveys and the High School Transcript File.

Transcript data were available for about 17,200 students. The sample used for this report was limited to public high school graduates who earned a regular high school diploma. The variable G12CTRL2 was used to restrict the sample to students attending public high schools, and the variable FRREASL was used to further limit the sample to those students who graduated from high school. (Graduates earning special education diplomas were excluded from the sample.) Only those graduates who earned more than 16 total Carnegie units in high school, and a positive number of Carnegie units in English, were included in the sample.

This report used the Second Follow-up and High School Transcript File to examine the course-taking patterns and academic achievement of 11,780 public high school graduates in 1992. To explore the postsecondary and labor market experiences of this graduating class 2 years after high school, researchers analyzed Fourth Follow-up data. The 1994 sample comprised 8,550 public high school graduates.

Standard errors for the data were computed using the Taylor series approximation method. For further information on NELS:88, consult Steven J. Ingelos et al., National Education Longitudinal Study of 1988 Second Follow-up: Data File User's Manual, Washington D.C.: National Center for Education Statistics, U.S. Department of Education, September 1994. You may also speak to Jeffrey Owings at (202) 219-1777.

## National Employer Surveys

The National Employer Surveys (NES) of 1994 and 1997 gathered data from a random sample of private firms on the perceived proficiency of the work force and investments in formal and informal training. The surveys were designed by the National Center on the Educational Quality of the Workforce and were administered by the Bureau of the Census. Public and not-forprofit institutions, establishments with fewer than 20 employees, and corporate headquarters were excluded from the sample. The survey oversampled establishments in the manufacturing sector and those with more than 100 employees. In 1994 and 1997, respectively, 3,167 and 3,081 firms were included in the NES samples. Standard errors take into account the average design effect of the survey, which was calculated through the jackknife method. Weights were created to make the sample representative of the universe of private U.S. firms with 20 or more employees. For more information about the surveys, contact Dan Shapiro at the Institute for Research in Higher Education at the University of Pennsylvania at (215) 898-4585.

## National Longitudinal Study of Youth

The National Longitudinal Study of Youth (NLSY) of 1997 collected data on school characteristics, programs, and practices through its School Administrator Survey (SAS) component. The SAS was designed as a census of public and private schools with a twelfth grade among those schools in the geographic areas in which youth in the NLSY student sample were drawn. Data from the 3,281 public schools in the sample were analyzed. Weights in the data file corrected for nonresponse and made the sample representative of the universe of U.S. schools with a twelfth grade, excluding full-time and area vocational schools. Standard errors take into account the average design effect of the survey, which was calculated through the jackknife method. For more information about this survey, please contact Chuck Pierrets at the Bureau of Labor Statistics at (202) 606-7519.

## National Postsecondary Student Aid Study

The National Postsecondary Student Aid Study (NPSAS) is a comprehensive nationwide study conducted to determine how students and their families pay for postsecondary education. It also describes demographic and other characteristics of enrolled students. The study is based on a nationally representative sample of students taking courses for credit at postsecondary education institutions that are eligible to award federal financial aid. The sample includes students attending all types and levels of institutions, including public and private institutions and less-than-2year institutions, 2-year institutions, and 4-year colleges and universities. The study is designed to address the policy questions resulting from the rapid growth of financial aid programs and the
succession of changes in financial aid program policies since 1986. The first NPSAS was conducted in 1986-87, followed by successive surveys in 1989-90, 1992-93, and 1995-96. The 1989-90 and 1995-96 studies (NPSAS:90 and NPSAS:96) were used in this report.

NPSAS:90 information was obtained from approximately 1,100 postsecondary institutions on about 47,000 undergraduates. Standard errors for the data were computed using the Taylor series approximation method. Some items on the NPSAS:90 survey had high item nonresponse. For more information on the NPSAS:90 survey, consult the U.S. Department of Education, National Center for Education Statistics, Methodology Report for the 1989-90 National Postsecondary Student Aid Study, Washington, D.C.: 1992.

NPSAS:96 information was obtained from approximately 830 postsecondary institutions on approximately 41,000 undergraduates. The weighted response rate for institutional record data collection was 93.1 percent. The weighted effective response rate for the telephone interviews was 76.2 percent. Standard errors for the data were computed using the Taylor series approximation method. For more information on the NPSAS:96 survey, consult the U.S. Department of Education, National Center for Education Statistics, Methodology Report for the 1995-96 National Postsecondary Student Aid Study (NCES 98-073), Washington, D.C.: 1997.

## Schools and Staffing Survey

The Schools and Staffing Survey (SASS) collects public- and private-sector data on the nation's elementary and secondary school teaching force, aspects of teacher supply and demand, teacher workplace conditions, characteristics of school administrators, and school policies and programs. Three such surveys have been administered; in 1987-88, 1990-91, and 1993-94. This report used the 1990-91 and 1993-94 SASS to report trends in teacher characteristics and the 1993-94 SASS to describe professional development activities.

The report restricted the survey samples to public school teachers of grades $9-12$. The relevant samples used for the analysis in this report included 23,650 teachers from the 1990-91 SASS, and 22,552 teachers from the 1993-94 SASS. The report used linked data from the Teacher and School Files. Standard errors were calculated using the Balanced Repeated Replicates (BRR) weighting method. Teachers who taught 50 percent or more of their courses in vocational subjects were classified as "vocational." For a detailed description of the procedures used to identify vocational teachers, see Phillip Kaufman, A Comparison of Vocational and NonVocational Public School Teachers in Grades 9 to 12, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, 1991. For general background on the 199091 SASS, see Steven Kaufman and Hertz Huang, 1990-91 Schools and Staffing Survey: Sample

Design and Estimation, Technical Report, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, 1993. For general background on the 1993-94 SASS, see 1993-94 Schools and Staffing Survey: Sample Design and Estimation, Technical Report, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, 1996. For additional information, you can also contact Charles Hammer, National Center for Education Statistics at (202) 219-1330 or Charles_Hammer@ed.gov.

## Technical Notes

## Differences Among Published Data

The Secondary School Taxonomy that was used to classify high school courses in this report was recently revised by NCES (see figure 1 in the Introduction). Generally, only minor revisions in course classifications were made, although a few were notable. For example, the revised taxonomy now includes English as a Second Language courses under English rather than under Non-English (previously Foreign) Languages. Additionally, all computer-related courses are now included under the Vocational curriculum, whereas some were previously included under Mathematics. Because of these and other shifts in the placement of specific courses, there may be small differences between the percentages and average credits published in this report and those published in previous Vocational Education in the United States publications or other NCES publications, such as the Digest of Education Statistics. However, differences should generally be small. See D. Bradby and E.G. Hoachlander, 1998 Revision of the Secondary School Taxonomy (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, Working Paper No. 1999-06, March 1999).

Generally, differences among published data may also be due to the application of different rules for determining which students should be included in an analysis. This report bases its analysis of high school course taking on the sample of public high school graduates who earned 16 or more Carnegie units in high school and a positive number of Carnegie units in English. See M. Alt and D. Bradby, Procedures Guide for Transcript Studies (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, Working Paper No. 1999-05, March 1999).

## Accuracy of Estimates

The statistics in this report are estimates derived from samples. Two broad categories of error occur in such estimates: sampling and nonsampling error. Sampling errors happen because observations are made only on samples of students, not on entire populations. Nonsampling
errors occur not only in surveys of sample groups but also in complete censuses of entire populations.

Nonsampling errors can be caused by a number of factors: inability to obtain complete information about all students in all schools in the sample (some students or schools refused to participate, or students participated but answered only certain items); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct information; mistakes in recording or coding data; and other errors in collecting, processing, sampling, and estimating missing data.

The accuracy of a survey result is determined by the effect of sampling and nonsampling errors. In surveys with sample sizes as large as those used in this report, the sampling errors generally are not the primary concern, except where separate estimates are made for relatively small subpopulations, such as Asian/Pacific Islanders or American Indian/Alaskan Natives. In this report, small sample sizes were generally not a problem. Instances are noted where sample sizes were small enough to affect sampling errors.

## Complex Sampling

The BPS:90/94, CPS, HS\&B, 1990 and 1994 HSTS, NELS:88, NES, NLSY-97, NPSAS, and SASS all use multistage-sample designs. The resulting samples, while representative, are not simple random samples. For example, students in both HSTS and in HS\&B were selected within high schools that were grouped within strata. Because of the effects of the multistage designs (students within schools and schools within various strata) and because of the effects of certain adjustments to the sampling weights (poststratification and weighting adjustments), observations made on different students cannot be assumed to be independent of one another. As a result, ordinary formulas used to estimate the variance of sample statistics, based on assumptions of independence and simple random samples, will tend to underestimate the true sample variability. To overcome this problem, standard errors for most estimates in this report were calculated using either replication procedures or Taylor residual techniques.

All estimates, standard errors, unweighted n's, and weighted n's are available from NCES in comma-separated form for use with all major spreadsheet software and microcomputers. In addition, hard copies of the taxonomies used to categorize courses and programs are also available, as well as hard copies of all tables in the report. Those interested in this information should contact the Early Childhood, International, and Cross-Cutting Studies Division, National Center for Education Statistics, 555 New Jersey Avenue NW, Washington, D.C. 20208.

## Statistical Procedures

Most statistical tests used in this report were based on $t$ statistics and included estimates of the probability of a Type I error, or significance level. The significance levels were determined by calculating $t$ values for the differences between each pair of means or proportions and by comparing these to published tables of significance levels for two-tailed hypothesis testing. These $t$ values may be computed for comparisons using independent estimates with the following formula:

$$
\begin{aligned}
& t=\underline{P_{1}-P_{2}} \\
& \sqrt{s e_{1}^{2}+s e_{2}^{2}}
\end{aligned}
$$

where $\mathrm{P}_{1}$ and $\mathrm{P}_{2}$ are the estimates to be compared and $\mathrm{se}_{1}$ and $\mathrm{se}_{2}$ are their corresponding standard errors.

In some cases, comparisons within and among rows or columns of data were made, and one of several tests of dependence was used. These tests included linear trend and chi-squared tests for tables of proportions, and weighted least squares (WLS) regression and analysis of variance (ANOVA) for tables of means. Linear trend and WLS tests were used to examine whether an increasing or decreasing trend existed within a single row or column of ordered data and to compare rows or columns of ordered data. Chi-squared and ANOVA tests were used to compare rows or columns of unordered data.

## Multiple Comparisons

The baseline $t$ value for the statistical analysis performed in this report is assumed to be 1.96, which represents the number of standard errors away from the expected value of the sample mean. This corresponds to a 95 percent confidence interval or a 5 percent alpha level. As the number of comparisons on the same set of data increases, so does the likelihood that the $t$ value for at least one of the comparisons will exceed 1.96 simply due to increases in sampling error. For a single comparison, there is a 5 percent chance that the $t$ value will exceed 1.96 due to sampling error. For five tests, the risk of getting at least one $t$ value higher than 1.96 increases to 23 percent, and for 20 comparisons, 64 percent.

One way to compensate for this risk when making multiple comparisons is to adjust the alpha level to take into account the number of comparisons being made. For example, rather than establishing an alpha level of 5 percent for a single comparison, the alpha level is set to ensure that the likelihood is less than 5 percent that the $t$ value for any of the comparisons exceeds the critical value by chance alone when there are truly no differences for any of the comparisons.

This Bonferroni adjustment is calculated by taking the desired alpha level and dividing it by the number of possible comparisons, based on the variables(s) being compared. The higher $t$ value corresponding to the revised lower alpha level must be exceeded in order for any of the comparisons to be considered significant. For example, to test for differences in participation rates between whites, blacks, and Hispanics, the following steps would be involved:

- Establish the number of comparisons-in this case three (whites and blacks, whites and Hispanics, and blacks and Hispanics). The number of two-way comparisons that can be made equals $[(\mathrm{n})(\mathrm{n}-1)] / 2$, where n is the number of variable categories. Thus, with three categories, the number of possible comparisons is $[(3)(2)] / 2=3$.
- Divide the desired alpha level, 0.05 , by the number of comparisons (e.g., three) to obtain the new alpha level $(0.05 / 3=0.0166)$.
- Consult a table of $t$ statistics (or the standard normal table for z values if the n is large) to find the two-tailed $t$ value that corresponds to that alpha $(t=2.39$ for alpha $=$ 0.0166 ).

All comparisons in this report were tested using the Bonferroni adjustment for $t$ tests. The number of comparisons used to make the Bonferroni adjustment was based on the relationship(s) being tested.

## Appendix C-Glossary

Academic subjects: The high school academic curriculum is divided into the main subject areas listed below and corresponds to the 1998 revised Secondary School Taxonomy categories. The examples given are not exhaustive of the courses included in each subject area.

Mathematics: Includes courses in general mathematics, consumer mathematics, prealgebra, algebra 1, geometry, algebra 2 through precalculus (including Algebra 2 and 3, Trigonometry, Analytic Geometry, and Mathematical Analysis), advanced math (including Calculus, AP Calculus, IB Mathematics, and Probability and Statistics), unified mathematics (an integrated course sequence usually taught over two or three years), and occupationally related mathematics (including Vocational Mathematics, Business Mathematics, and Technical Mathematics). Course levels indicated in this report include the "below Algebra 1"/"Algebra 1 or higher" distinction, as well as functional, basic, and regular designations.

Science: Includes courses in survey science, biological science (including Biology and some specialized courses such as Botany, Zoology, and Anatomy and Physiology), chemistry, physics, earth science, physical science, and engineering. Course levels indicated in this report include basic, regular, advanced/honors, specialized topic, and AP/IB designations.

English: Includes survey courses (including language skills courses and English 9-12), as well as courses in literature, composition and writing, speech, and English as a Second Language. Course levels indicated in this report include functional, basic, regular, advanced/honors, and AP/IB designations.

Social studies: Includes courses in American history, world history, government and politics, economics, behavioral sciences (including Psychology and Sociology), geography, and social science/humanities/other (including Social Studies, American Studies, Area Studies, Women's Studies, Law, Anthropology, and Philosophy). Course levels indicated in this report include basic, regular, advanced/honors, specialized topic, and $\mathrm{AP} / \mathrm{IB}$ designations.

Fine arts: Includes courses in visual arts, music, dance, and theater arts.

Non-English languages: Includes courses in Spanish, French, German, Latin, Italian, and other non-English languages and literatures.

Apprenticeship: Programs registered with the Department of Labor or a state apprenticeship agency in accordance with the Act of August 16, 1937, commonly known as the National Apprenticeship Act, which is conducted or sponsored by an employer, a group of employers, or a joint apprenticeship committee representing both employers and a union, and which contains all terms and conditions for the qualification, recruitment, selection, employment, and training of apprentices.

Carnegie unit: A standard of measurement used for secondary or high school education that represents the completion of a course that meets 1 period per day for 1 year. See credit.

College preparatory: Public high school graduates were classified as college preparatory if they completed 4.0 credits in English; 3.0 credits in mathematics at the Algebra 1 level or higher; 2.0 credits in biology, chemistry, and/or physics; 2.0 credits in social studies with at least 1.0 credit in U.S. or World History; and 2.0 credits in a single foreign (non-English) language during high school. Students who met both the vocational concentrator (see below) and college preparatory criteria were generally included with the vocational group. In a few instances, this "both" group was reported separately. See vocational concentrator and other/general students.

Community college: A public institution that awards associate's degrees or less-than-4-year, subbaccalaureate certificates as its highest award type. See postsecondary institutions, public 2-year institutions.

Comprehensive high school: The typical U.S. high school, offering, at minimum, academic studies and usually some vocational education.

Cooperative education: Programs that allow students to earn course credit for paid or unpaid employment that is related to a specific occupational program of study. In contrast, general work experience is not connected to a specific occupational program.

Core academic standards: In the 1983 publication A Nation at Risk, the National Commission on Excellence in Education recommended that high school graduation requirements be strengthened, and that, at a minimum, all students take 4 years of English; 3 years each of mathematics, science, social studies; and one-half year of computer science. The "core academic standards" referred to in this report include the recommendations for English, mathematics, science, and social studies.

Courses completed: Public high school graduates were said to have completed a course in a subject area if they earned a Carnegie unit, or a fraction of a unit, in that subject area.

Credit: At the secondary or high school education level, credits and Carnegie units were used interchangeably to represent the completion of a course that meets 1 period per day for 1 year. (See Carnegie unit.) At the postsecondary level, credits were standardized across institution types, with 1 credit generally equivalent to 1 hour of classroom work for 1 semester.

Curriculum types: At its most aggregated level, the 1998 revised Secondary School Taxonomy divides the high school curriculum into four distinct curricula:

## Academic: See academic subjects.

Vocational: The high school vocational curriculum is divided into family and consumer sciences education, general labor market preparation, and specific labor market preparation coursework. See vocational education and vocational programs.

## Enrichment/other: See enrichment/other.

Special education: Includes courses designed for students with individual education plans. This report does not describe special education coursework, with the exception of functional or exceptional/special education (ESE) courses taken within the academic curriculum. These courses are designated as functional level courses.

## Degrees: See postsecondary award types.

Dependency status: Postsecondary students reported whether they were financially dependent on or independent from their parents.

Disability status: High school students' disability status was constructed from teacher and parent responses. Postsecondary students' disability status was based on self-reported information.

Enrichment/other: Included in this high school curriculum are courses designed for students' personal enrichment, including courses in general skills; health, physical, and recreation education; religion and theology; and military science.

General work experience: Programs that allow students to earn course credit for paid or unpaid employment. Unlike cooperative education, general work experience is not connected to a specific occupational program of study.

New Basics standards: In the 1983 publication A Nation at Risk, the National Commission on Excellence in Education recommended that high school graduation requirements be strengthened, and that, at a minimum, all students take 4 years of English; 3 years each of mathematics, science, social studies; and one-half year of computer science. The "core academic standards" referred to in this report include the recommendations for English, mathematics, science, and social studies. See core academic standards.

Other/general students: Public high school graduates were classified as other/general if they met neither the college preparatory or vocational concentrator criteria. See college preparatory and vocational concentrator.

Postsecondary award types: Certificates and degrees awarded by postsecondary institutions are defined as follows:

Certificate: An award granted for the successful completion of a postsecondary program of studies. Subbaccalaureate certificates require less than 4 years (or equivalent) of fulltime college-level study. These certificates are usually awarded in a vocational field and may cover the same coursework as a vocational associate's degree, but without the general education requirements. Some certificates, such as teaching certificates, may be awarded for post-baccalaureate study.

Associate's degree: A degree granted for the successful completion of a subbaccalaureate program of studies, usually requiring at least 2 years but less than 4 years (or equivalent) of full-time college-level study. This includes degrees awarded in vocational and academic fields.

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time collegelevel study.

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree.

Education specialist: A degree or certificate generally awarded for one year's work beyond the master's level.

Doctorate: An earned degree carrying the title of Doctor. Many doctorates in both academic and professional fields require an earned master's degree as a prerequisite. Firstprofessional degrees, such as M.D. and D.D.S., are not included under this heading.

First-professional degree: A degree that signifies both completion of the academic requirement for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is usually based on a program requiring at least 2 academic years of work before entrance and a total of at least 6 academic years of work to complete the degree program, including both previously required college work and the professional program itself.

Postsecondary institutions: Six main types of postsecondary institutions offer vocational education programs and are included in this report:

Public 4-year institutions: Include public institutions that award bachelor's or graduate degrees as their highest degree type.

Public 2-year institutions: Include public institutions that award associate's degrees or less-than-4-year, subbaccalaureate certificates as their highest award type. These institutions are sometimes referred to as community colleges in this report. See community college.

Public less-than-2-year institutions: Include public institutions that generally do not award degrees but award subbaccalaureate certificates of less than 2 years in length. These institutions are sometimes referred to as vocational-technical institutes in this report. See vocational-technical institute.

Private, not-for-profit 4-year institutions: Include private, not-for-profit institutions that award bachelor's or graduate degrees as their highest degree type.

Private, not-for-profit 2-year institutions: Include private, not-for-profit institutions that award associate's degrees or less-than-4-year, subbaccalaureate certificates as their highest award type. These institutions include all private, not-for-profit less-than-4-year institutions.

Private, for-profit institutions: Include private, for-profit institutions that usually offer certificates but may offer other degrees as well. These institutions are sometimes referred to as private proprietary institutions.

## Postsecondary major: See postsecondary program type.

Postsecondary program type: Subbaccalaureate majors are classified into the following main program areas according to the taxonomy depicted in figure 2 in the Introduction to this report:

Academic: Includes mathematics and science; letters, humanities, and communications; social sciences; art and design; and education, among other fields.

Vocational: Includes program areas listed under vocational programs for postsecondary education. See vocational programs, at the postsecondary level.

Race-ethnicity: Classification indicating general racial or ethnic heritage based on selfidentification. These categories are in accordance with the classification scheme presented below:

American Indian/Alaskan Native: A person having origins in any of the peoples of North America and maintaining cultural identification through tribal affiliation or community recognition.

Asian/Pacific Islander: A person having origins in any of the peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands including, for example, China, India, Japan, Korea, the Philippine Islands, and Samoa.

Black, non-Hispanic: A person having origins in any of the black racial groups in Africa, excluding persons of Hispanic origin. For simplicity's sake, persons in this group were generally referred to as blacks in this report.

Hispanic: A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

White, non-Hispanic: A person having origins in any of the peoples of Europe, North Africa, or the Middle East, excluding persons of Hispanic origin. For simplicity's sake, persons in this group were generally referred to as whites in this report.

School-based enterprise: A class-related activity that engages students in producing goods or services for sale or use to people other than the participating students themselves.

Socioeconomic status: Constructed from data on father's occupation, father's education, mother's education, family income, and material possessions in the household.

Subbaccalaureate student: A postsecondary student who reported that he or she was currently seeking an associate's degree, postsecondary certificate, or was not seeking a postsecondary credential of any kind.

Tech prep: Programs consisting of the 2 or 4 years of secondary education or high school preceding graduation and 2 years of higher education, or an apprenticeship program of at least 2
years following secondary instruction, with a common core of required proficiency in mathematics, science, communications, and technologies, designed to lead to an associate's degree or certificate in a specific career field. Also referred to as $2+2$ programs.

Urbanicity: Schools were classified based on standards used by the U.S. Census:
Urban: A school was located in the central city of a Standard Metropolitan Statistical Area (SMSA).

Suburban: A school was located either (1) within a SMSA, but outside the central city; or (2) outside a SMSA, but in a town with a population of 2,500 or more and that was defined as urban.

Rural: A school was located in a community with a population of less than 2,500 and that was defined as rural.

Vocational concentrator: Public high school graduates were classified as vocational concentrators if they completed 3.0 or more credits in a single occupational program area. Students who met both the vocational concentrator and college preparatory criteria were generally included with the vocational group. In a few instances, this "both" group was reported separately. See college preparatory and other/general students.

Vocational and technical education: Organized educational activities that offer a sequence of courses that provides individuals with the academic and technical knowledge and skills the individuals need to prepare for further education and for careers (other than careers requiring a baccalaureate, master's, or doctoral degree) in current or emerging employment sectors and include competency-based applied learning that contributes to the academic knowledge, higher-order reasoning and problem-solving skills, work attitudes, general employability skills, technical skills, and occupation-specific skills of an individual.

This publication refers to the following three types of vocational education at the high school level. (All vocational education at the postsecondary level is considered to be specific labor market preparation.) The examples given are not exhaustive of the courses offered in each area.

Family and consumer sciences education: Consists of courses intended to prepare students for roles outside the paid labor market, including Home Economics, Child Development, Foods and Nutrition, and Clothing.

General labor market preparation: Consists of courses that teach general employment skills but do not have as their primary objective preparing students for paid employment
in a specific field. These courses include Typewriting, Word Processing, Industrial Arts, Career Exploration, General Work Experience, and Technology Education.

Specific labor market preparation: Consists of courses that teach skills and provide information required in a particular vocation or occupation. Courses are organized into occupationally specific program areas. See vocational programs.

Vocational high school: Includes full-time vocational high schools and area or regional vocational schools. The latter type of school may serve postsecondary and adult students in addition to high school students.

Vocational programs: Vocational programs (also called specific labor market preparation or occupationally specific programs) are offered at both the secondary and postsecondary levels, although the classifications differ somewhat at the two levels. The examples given are not exhaustive of the courses offered in each area.

At the secondary or high school level, vocational coursework is grouped by the 1998 revised Secondary School Taxonomy into the following occupationally specific program areas:

Agriculture and renewable resources: Includes courses in Agricultural Mechanics, Horticulture, Animal Sciences, and Environmental Management.

Business: Offers training in business services and business management, including courses in Bookkeeping, Accounting, Data Entry, Office Procedures, Business and Management, and Banking and Finance.

Marketing and distribution: Includes courses related to the selling and distribution of goods and services, including Distributive Education, Distribution and Marketing, Fashion Merchandising, and Entrepreneurship.

Health care: Includes courses intended to prepare students for careers in the health professions, such as Health Occupations, Dental Assistant, Medical Laboratory Technologies, and Practical Nursing.

Public and protective services: Includes courses in Criminal Justice, Fire Protection, Public Administration, and Social Work.

Trade and industry: Includes coursework in construction trades, mechanics and repair, precision production, and transportation and material moving. The construction trades program area includes courses in Electricity, Carpentry, Plumbing, and General

Construction. Mechanics and repair includes courses in Industrial Maintenance; Radio and TV Repair; Air Conditioning, Refrigeration, and Heating; and Auto Mechanics. Precision production includes courses in Drafting, Graphic Arts, Machine Shop, Woodworking, Plastics, Electronics, and Leatherwork and Upholstery. Transportation and material moving includes Aviation Technology, Marine Engine and Boat Repair, and Truck Driving.

Technology and communications: Includes coursework in computer technology, communication technology, and other technologies. The computer technology field includes courses in Computer Applications, Computer Programming, and Data Processing. The communication technology field includes courses in Broadcast Management, Film Making, and Radio and Television Production. Other technology courses include Electronic Technology, Industrial Production Technology, and Chemical Technology.

Personal and other services: Includes courses in Cosmetology, Clothing and Textiles, Vocational Home Economics, and Institutional Maintenance.

Food service and hospitality: Includes courses in Food Service and Nutrition, Hospitality, and Travel and Tourism.

Child care and education: Includes courses in Teacher Assisting, Child Care, and Elder Care.

At the postsecondary level, vocational coursework is grouped into the following occupationally specific program areas according to the taxonomy depicted in figure 2 in the Introduction to this report:

Agriculture: Includes coursework in agricultural business and production including horticulture, agricultural sciences such as animal sciences, and conservation and renewable natural resources.

Business and office: Includes coursework in business administration and management such as accounting, and in administrative and secretarial services such as typing and word-processing.

Marketing and distribution: Includes coursework in the marketing operations of apparel and accessories, business and personal services, financial services, and hospitality and recreation, as well as retailing and wholesaling operations.

Health: Includes coursework in nursing and other allied health fields such as dental and physical therapy assisting, and in health sciences such as medical laboratory and clinical anatomy.

Home economics: Includes coursework in family and community studies, foods and nutrition science, child care provider/assistant, and clothing, apparel, and textile workers and managers.

Technical education: Includes the following subgroupings:
Protective services: Includes coursework in criminal justice and fire protection.

Computers/data processing: Includes co coursework urses in computer programming, data processing, and computer and information sciences.

Engineering/science technologies: Includes coursework in architectural engineering technology; computer engineering technology; heating, air conditioning, and refrigeration technology; industrial/manufacturing technology; biological technology; and nuclear and industrial radiological technologies.

Communication technologies: Includes coursework in educational media, photographic technology, and radio and television broadcasting technology.

Trade and industry: Includes coursework in construction; automotive and other mechanics and repairers; drafting and other precision production; transportation and materials moving; and consumer, personal, and miscellaneous services.

Vocational specialist: Public high school graduates were classified as vocational specialists if they completed 4 or more Carnegie units in a single vocational program area in high school, with at least 2 of those units in a second or later course in the sequence. This classification is based on a more strict definition of vocational participation than that for vocational concentrators. See vocational concentrator.

Vocational teacher: Teachers of grades 9-12 were assigned vocational teaching status if 50 percent or more of the courses they taught were in a vocational area as defined by the Secondary School Taxonomy, or their primary assignment was in a vocational area when course information was not available.

Vocational-technical institute: Include public institutions that generally do not award degrees but award subbaccalaureate certificates of less than 2 years in length. See postsecondary institution types, public less-than-2-year institutions.

[^0]:    ${ }^{1}$ The findings in this section come from the 1994 and 1997 National Employer Surveys, which gathered data from a random sample of private firms with 20 or more employees.

[^1]:    ${ }^{2}$ Employer-provided training, which also increased over this time period, may have contributed to proficiency gains. Alternatively, education reform efforts over the last decade may have contributed to the improvement in worker proficiency. In either case, it is impossible to establish a causal link from the available data.
    ${ }^{3}$ However, in a rigorous evaluation of the benefits of work-based learning, it would be necessary to compare all work-based learning participants, not just those who were hired, with other comparable workers. It may be, for example, that those workbased learning participants who were hired had better recommendations or references than those who were not.
    ${ }^{4}$ Unless otherwise noted, trends in this section come from an analysis of transcripts for public high school graduates in 1982, 1990, and 1994. In addition to the topics described in this section, Chapter IV of the report also presents findings on academic achievement gains (page 62), work experience and work-based learning (page 87), technology literacy (page 90), and teacher professional development activities (page 101).
    ${ }^{5}$ These decreases may be partly due to increases in high school graduation requirements implemented by many states after the publication of A Nation at Risk in 1983. Because students have been required to take more academic coursework, they may have elected to take fewer vocational courses. Alternatively, because of fiscal or economic pressures, or both, schools may have reduced their vocational offerings in recent years.

[^2]:    ${ }^{1}$ The New Basics core academic standards include 4 years of English and 3 years each of mathematics, science, and social studies.
    ${ }^{2}$ Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^3]:    ${ }^{6}$ The findings in this section come from the National Longitudinal Study of Youth of 1997, which provides information on public schools with a 12th grade. Unfortunately, schools classified by their districts as primarily "vocational" were excluded from the sample. Consequently, the survey generally describes public comprehensive high schools and, therefore, may provide a conservative estimate of local reform efforts.

[^4]:    ${ }^{7}$ The findings in this section come from the Schools and Staffing Surveys of 1991 and 1994.
    ${ }^{8}$ Academic teachers were more likely than vocational teachers to have a master's or doctorate/first-professional degree.
    ${ }^{9}$ Two data sets were used for the analysis in this section: High School and Beyond, for 1982 public high school graduates, and the National Education Longitudinal Study of 1988, for 1992 public high school graduates. In addition to the topics described in this section, Chapter V of the report also presents findings on postsecondary remedial coursework (page 125).

[^5]:    ${ }^{10}$ Unless otherwise noted, the findings in this section come from the 1989-90 and 1995-96 National Postsecondary Student Aid Study (NPSAS). Because recent postsecondary transcript data were not available, the information on trends at the postsecondary level is generally less detailed than that at the secondary level. Specifically, it was not possible to examine actual course-taking patterns in this section. Instead, the analysis relied primarily on self-reported degrees and majors. In addition to the topics described in this section, Chapter VI of the report also presents findings on work experience while enrolled (page 168), licensure (page 178), and labor market participation (page 179).
    ${ }^{11}$ The findings presented in this paragraph come from the U.S. Census Bureau's Current Population Surveys.
    ${ }^{12}$ There were substantial amounts of missing data on student's major field in both NPSAS surveys. About 24 percent of subbaccalaureate students in 1990 and 28 percent in 1996 did not report their major field.

[^6]:    ${ }^{1}$ National Commission on Excellence in Education, A Nation at Risk: The Imperative for Educational Reform (Washington, D.C.: 1983).
    ${ }^{2}$ See C. Stasz, T. Kaganoff, and R.A. Eden, Integrating Academic and Vocational Education: A Review of the Literature, 19871992 (MDS-1034) (Berkeley: National Center for Research in Vocational Education, March 1995); and C. Dornsife, Beyond Articulation: The Development of Tech Prep Programs (MDS-311) (Berkeley: National Center for Research in Vocational Education, February 1992).

[^7]:    ${ }^{3}$ See D. Bradby and E.G. Hoachlander, 1998 Revision of the Secondary School Taxonomy (Working Paper No. 1999-06) (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, March 1999).

[^8]:    SOURCE: Adapted from Denise Bradby and E.G. Hoachlander, 1998 Revision of the Secondary School Taxonomy (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, Working Paper No. 1999-06, March 1999).

[^9]:    ${ }^{4}$ Differences among published data may also be due to the application of different rules for determining which students should be included in an analysis. This report bases its analysis of high school coursetaking on the sample of public high school graduates who earned 16 or more Carnegie units in high school and a positive number of Carnegie units in English.
    ${ }^{5}$ For simplicity's sake, the "specific labor market preparation" categories in figure 1 are often referred to in this report as "occupational program areas."

[^10]:    ${ }^{6}$ The National Longitudinal Survey of Youth-1997 was conducted by the Bureau of Labor Statistics with support from the National School-to-Work Office. It contains a school administrator component.
    ${ }^{7}$ See U.S. Department of Education, Office of Educational Research and Improvement, National Assessment of Vocational Education Final Report to Congress, Vol. II (Washington, D.C.: July 1994).
    ${ }^{8}$ For example, the 1991 and 1994 Schools and Staffing Surveys, which provide information on high school teachers, can identify comprehensive high schools, vocational schools, and "other" schools (including special education schools). In contrast, the 1990 and 1994 High School Transcript Studies do not identify vocational schools separately from other public high schools.

[^11]:    ${ }^{9}$ Among 1992 public high school graduates, about 91 percent earned 1.0 or more credits in vocational education, and about 58 percent earned 3.0 or more such credits. See K. Levesque et al., Vocational Education in the United States: The Early 1990 s (NCES 95-024) (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 1995), table 10. In secondary education, a Carnegie unit is awarded for the completion of a course that meets one period per day for one year, or the equivalent. For simplicity's sake, the terms "Carnegie unit" and "credit" will be used interchangeably in this report.

[^12]:    ${ }^{10}$ All for-credit vocational coursework at the postsecondary level is considered to be specific labor market preparation. For-credit postsecondary vocational education does not have the equivalent of family and consumer sciences education and general labor market preparation, which are found at the high school level, although not-for-credit courses may include some similar coursework. Information on not-for-credit "adult" or "continuing" education courses is generally not available from the surveys used in this report and, therefore, is not covered in much depth in this publication.
    ${ }^{11}$ Some small changes have been made to the taxonomy since it was used in the previous two reports.

[^13]:    SOURCE: Adapted from Susan P. Choy and Laura J. Horn, A Guide to Using Postsecondary Transcript Data and an Overview of Course Taking in Less-than-Four-Year Postsecondary Institutions (Berkeley: National Center for Research in Vocational

[^14]:    ${ }^{12}$ High School and Beyond collected postsecondary transcripts for 1982 high school graduates. The Fourth Follow-up of the National Education Longitudinal Study of 1988 survey in 2002 may collect transcript data for 1992 high school graduates. The Beginning Postsecondary Students survey does not plan to collect transcripts for the 1989-90 cohort.
    ${ }^{13}$ The 1987 National Postsecondary Student Aid Survey (NPSAS) gathered data on students enrolled in postsecondary institutions only during the fall semester. Subsequent NPSAS surveys, usually administered about every 3 years, gathered data for students enrolled during the entire academic year. To maintain comparable student samples, the 1990 and 1996 NPSAS surveys were selected for the trend analysis in this report.

[^15]:    ${ }^{14}$ These surveys were administered by the U.S. Bureau of the Census. They were designed by the National Center on the Educational Quality of the Workforce at the University of Pennsylvania, which was funded by the Office for Educational Research and Improvement, U.S. Department of Education.

[^16]:    ${ }^{15}$ Unfortunately, due to an error during the design stage, vocational schools were excluded from the sample. Consequently, the survey generally describes comprehensive high schools and, therefore, may provide a conservative estimate of local reform efforts.

[^17]:    ${ }^{16}$ Sometimes discussion about the goods-producing sector excludes agricultural employment.

[^18]:    ${ }^{17}$ See J.R. Meisenheimer II, "The Services Industry in the 'Good' Versus 'Bad' Jobs Debate," Monthly Labor Review (February 1998): 22-47.

[^19]:    ${ }^{18}$ J.C. Franklin, "Industry Output and Employment Projections to 2006," Monthly Labor Review (November 1997): 39-57.
    ${ }^{19}$ See, for example, L. Mishel and J. Simon, "The State of Working America," Challenge (November-December 1988): 50-51; and M. Mahar, "Blue Collar, White Collar: Good Jobs Are Vanishing Throughout the Economy," Barron's (May 11, 1992): 824.
    ${ }^{20}$ See J.R. Meisenheimer II, "The Services Industry in the 'Good' Versus 'Bad' Jobs Debate" (February 1998).
    ${ }^{21}$ The narrowing of the wage gap may be due in part to increases over the years in service-related employment associated with high technology, particularly in the computer, telecommunications, and health fields. Additionally, the narrowing wage gap may be due in part to increasing demand for services employment and slackening demand for manufacturing employment.
    ${ }^{22}$ See J.R. Meisenheimer II, "The Services Industry in the 'Good' Versus 'Bad' Jobs Debate" (February 1998).

[^21]:    ${ }^{28}$ See G. Silvestri, "Occupational Employment Projections to 2006," Monthly Labor Review (November 1997): 58-83.

[^22]:    ${ }^{29}$ It should be remembered that BLS projections are based on past performance rather than anticipated developments or innovations, and may under- or over-predict the growth of some jobs.

[^23]:    ${ }^{30}$ W. Johnston and A. Packer, Workforce 2000: Work and Workers for the 21st Century (Indianapolis: Hudson Institute for the U.S. Department of Labor, 1987).
    ${ }^{31}$ See G. Silvestri, "Occupational Employment Projections to 2006," Monthly Labor Review (November 1997): 58-83.

[^24]:    ${ }^{32}$ S. Klein and R. Vergun, Workplace Skill Requirements: The Upskilling vs. Deskilling Debate (Washington, D.C.: U.S. Department of Education, National Assessment of Vocational Education, 1994).
    ${ }^{33}$ H. Shaiken, S. Herzenberg, and S. Kuhn, "The Work Process Under More Flexible Production," Industrial Relations 25 (2) (Spring 1986): 167-182.
    ${ }^{34}$ P. Adler, "New Technologies, New Skills," California Management Review 29 (1) (Fall 1986): 9-28.
    ${ }^{35}$ P. Capelli, Are Skill Requirements Rising? Evidence from Production and Clerical Jobs (Philadelphia: National Center on the Educational Quality of the Workforce, 1991).
    ${ }^{36}$ P. Capelli, Is the "Skills Gap" Really About Attitudes? (Philadelphia: National Center on the Educational Quality of the Workforce, 1992).
    ${ }^{37}$ U.S. Department of Labor, Skills and Tasks for Jobs: A SCANS Report for America 2000 (Washington, D.C.: 1990).

[^25]:    ${ }^{38}$ A. Greenspan, "Job Insecurity and Technology," address given at the Federal Reserve Bank of Boston's Conference on Technology and Growth, June 1996.

[^26]:    ${ }^{39}$ D. Boesel, L. Hudson, S. Deich, and C. Masten, "Employment Outcomes," National Assessment of Vocational Education Final Report to Congress, Vol. II, Chapter Six (Washington, D.C.: U.S. Department of Education, Office of Educational Research and Improvement, 1994).

[^27]:    ${ }^{40}$ Because corporate headquarters were not included in the survey sample, and because several local establishments that fall under a single corporate headquarters might have been surveyed, the precise unit of analysis for these surveys is the "work establishment." To simplify the terminology used in this report, this chapter refers to the percentage of "firms" or "employers"-rather than "work establishments"-reporting specific characteristics.
    ${ }^{41}$ Problems with large nonresponse on certain survey items meant that some of the items could not be used for this report.

[^28]:    ${ }^{42}$ For manufacturing establishments, the term "front-line workers" includes production workers; for other establishments, the term refers to sales and customer service workers.
    ${ }^{43}$ The surveys also did not ask whether education level or high academic performance were factors in retaining employees.
    ${ }^{44}$ In recent years, there have been several efforts to reinforce the connection between school performance and workplace success. For example, in 1997 the Business Coalition for Education Reform, which includes the National Alliance of Business and other organizations, began a two-year nationwide effort to encourage the use of school records in the hiring process. See J. Hughes, "Business Group Encourages Employers to Seek Prospective Workers’ Academic Transcripts," in Chronicle of Higher Education (Washington, D.C.: February 11, 1999).

[^29]:    ${ }^{45}$ For manufacturing establishments, the term "front-line workers" includes production workers; for other establishments, the term refers to sales and customer service workers.

[^30]:    ${ }^{46}$ The work-based learning experiences of these new front-line workers may have taken place at the current employer's firm or at another firm. The survey did not specify the location of the work-based learning in question.

[^31]:    ${ }^{47}$ A second definition was also sometimes used: vocational specialists completed 4.0 or more credits in a single occupational program area, with 2.0 or more of these units taken beyond the introductory level. However, the report generally focuses on the first, less restrictive definition of vocational concentrators.

[^32]:    ${ }^{48}$ P. Flanagan, Raising Standards: State Policies to Improve Academic Preparation for College (Rockville, MD: Westat, 1992).

[^33]:    ${ }^{49}$ Unfortunately, due to an error during the sample design stage, schools classified by their districts as primarily "vocational" were excluded from the NLSY sample. Consequently, the survey generally describes comprehensive high schools and, therefore, may provide a conservative estimate of local reform efforts.
    ${ }^{50}$ National Commission on Excellence in Education, A Nation at Risk (1983).

[^34]:    ${ }^{51}$ For the health program area, the increase occurred primarily between 1990 and 1994.
    ${ }^{52}$ For simplicity's sake, this report refers to "black, non-Hispanic" students as "black" and "white, non-Hispanic" students as "white." However, it should be remembered that all Hispanic students, regardless of race, are included in the Hispanic group.

[^35]:    ${ }^{53}$ The data show no other significant differences among racial-ethnic groups pertaining to the completion of vocational credits in 1982, 1990, and 1994.

[^36]:    SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

[^37]:    ${ }^{54}$ Total coursework includes academic, vocational, and enrichment/other coursework.

[^38]:    ${ }^{55}$ The difference in specialization rates for Asians/Pacific Islanders and Hispanics was not statistically significant.

[^39]:    ${ }^{56}$ In 1990, however, the difference in concentration rates between students in rural and suburban schools was not statistically significant.
    ${ }^{57}$ In the 1983 publication A Nation at Risk, the National Commission on Excellence in Education recommended that high school graduation requirements be strengthened, and that, at a minimum, all students take 4 years of English; 3 years each of mathematics, science, and social studies; and one-half year of computer science. The "core academic standards" referred to in this report include the recommendations for English, mathematics, science, and social studies.
    ${ }^{58}$ Research on the integration of academic and vocational education indicates that academic knowledge and skills can also be learned via vocational programs-particularly through authentic, real-world applications-as well as via academic coursework. See C. Stasz, T. Kaganoff, and R.A. Eden, Integrating Academic and Vocational Education: A Review of the Literature, 19871992 (MDS-1034) (Berkeley: National Center for Research in Vocational Education, March 1995).

[^40]:    ${ }^{59}$ It should be remembered that these three high school groups were classified based on their high school course-taking histories. While the "New Basics" academic standards and college preparatory criteria used in this publication were similar, the overlap between them was not complete ( 90 percent of college preparatory students fulfilled the New Basics standards). (See the college preparatory criteria described at the beginning of this chapter.) Since students who met both the vocational concentrator and college preparatory criteria were included in the vocational group, all vocational concentrators could meet the New Basics standards, at least theoretically. However, since the general group was the residual group that met neither the vocational nor college preparatory criteria, this group might be less likely to meet the New Basics academic standards.

[^41]:    ${ }^{1}$ These percentages are the average rates calculated for each student in the population.
    ${ }^{2}$ This category includes some vocational concentrators who also completed a college preparatory curriculum.

[^42]:    ${ }^{60}$ Education research has shown that applied learning can contribute to academic achievement. For example, in a regression analysis using HS\&B data, Meyer found that courses incorporating applied mathematics content, including mathematically relevant vocational courses, contributed positively to students' mathematics achievement gains between the 10th and 12th grades. Rasinski, on the other hand, did not find that vocational coursework contributed to academic gains, although he used different equation specifications than Meyer. See R. Meyer, "Applied Versus Traditional Mathematics: New Econometric Models of the Contribution of High School Courses to Mathematics Proficiency" (Discussion paper no. 966-92) (Madison: University of Wis-consin-Madison, 1992); K. Rasinski and S. Pedlow, "Using Transcripts to Study the Effectiveness of Vocational Education," Journal of Vocational Education Research 19 (3) (1994): 23-44.
    ${ }^{61}$ See, for example, A. McCormick, J. Tuma, and J. Houser, Vocational Course Taking and Achievement: An Analysis of High School Transcripts and 1990 NAEP Assessment Scores (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 1995).

[^43]:    ${ }^{62}$ The difference between vocational concentrators and the general group in terms of the percentage of low-level mathematics courses taken was not statistically significant for the highest 8th-grade test quartile.

[^44]:    ${ }^{1}$ These include language skills and functional and basic English courses.
    ${ }^{2}$ These percentages are the average rates calculated for each student in the population.
    ${ }^{3}$ Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^45]:    ${ }^{63}$ The difference between vocational concentrators and the college preparatory group in terms of test score gains was not statistically significant for reading gains between the 10th and 12th grades. Differences between vocational concentrators and the other/general group were statistically different for 8 th- to 10 th-grade and 8 th- to 12 th-grade gains in reading and 10th- to 12thgrade and 8th- to 12 th-grade gains in mathematics. Vocational concentrator gains in science were statistically indistinguishable from gains in science for the other/general group for all gain years.

[^46]:    ${ }^{64}$ For example, a gains analysis should control for initial academic achievement differences. However, it does not control for effects that might accrue over time due to those initial differences-such as different high school course-taking patterns resulting from 8th-grade achievement differences.
    ${ }^{65}$ The 18 -point reading gain for vocational concentrators and the 19-point reading gain for other/general students were not statistically different.

[^47]:    ${ }^{66}$ NLSY provided information on public schools with a 12 th grade. For simplicity's sake, this section refers to these schools as public high schools. Because vocational schools were mistakenly excluded from the sample, the survey generally describes comprehensive high schools, rather than all high schools, which may provide a conservative estimate of local reform efforts. Also, survey respondents were not asked to describe their reform efforts in any detail; therefore, it is not possible to know what activities they classified as integration, tech-prep, and other reform efforts.

[^48]:    ${ }^{67}$ The national tech-prep evaluation conducted by Mathematica found that by fall 1995 , more than 1,000 education consortia in the country-encompassing about 70 percent of U.S. school districts serving about 90 percent of all high school students-offered tech prep. This finding is not incompatible with the above finding that 50 percent of public high schools offered tech prep. The national tech-prep evaluation surveyed state-level tech prep coordinators and local tech-prep consortium coordinators, rather than high school administrators, who represented the survey universe for the 1997 findings presented in this report. It is possible for a local education consortium to offer tech prep, but not all of the high schools in the school districts participating in that consortium do so. See A. Hershey et al., Focus for the Future: The Final Report of the National Tech-Prep Evaluation (Princeton, NJ: Mathematica Policy Research, 1998), p. xv.

[^49]:    ${ }^{68}$ Some of this student-reported employment may include school-organized work experiences.
    ${ }^{69}$ In this section, cooperative education describes programs that allow students to earn school credit for paid or unpaid employment that is related to a specific occupational program of study. In contrast, general work experience is not connected to a specific occupational program.
    ${ }^{70}$ The difference in overall work rates for vocational concentrators and other/general students was not statistically significant.

[^50]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^51]:    ${ }^{71}$ In 1990, the definition of computer education in the survey was expanded to include former "typewriting" courses, since these were increasingly becoming "computer keyboarding" courses.

[^52]:    ${ }^{72}$ The difference in course completion rates between American Indians/Alaskan Natives and blacks in 1982 was not statistically significant.
    ${ }^{73}$ These differences were not statistically significant.
    ${ }^{74}$ It is not possible to determine from the available data the extent to which the shift from industrial arts to technology education represents relabeling versus a change in course content or objectives.

[^53]:    SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

[^54]:    ${ }^{75}$ The changes in the percentages of vocational teachers with bachelor's and education specialist degrees were not statistically significant.
    ${ }^{76}$ The only exceptions were that technical teachers were not statistically different from career education, health, and "other" vocational teachers, and "mixed" vocational teachers were not statistically different from health teachers.
    ${ }^{77}$ See "The State of Certification," Vocational Education Journal 68 (6) (September 1993): 30-35.
    ${ }^{78}$ Health teachers were statistically different from trade and industry teachers, and "other" vocational teachers were statistically different from both trade and industry and "mixed" vocational teachers. "Other" vocational teachers were not statistically different from academic teachers.

[^55]:    ${ }^{79}$ The percentages of vocational teachers with less than 3 years of experience and 3-9 years of experience remained about the same between 1990-91 and 1993-94.
    ${ }^{80}$ Unlike the increase in the percentage of vocational teachers with less than 3 years of teaching experience, which was not statistically significant, the increase for academic teachers in this experience group was significant.

[^56]:    ${ }^{81}$ The certification categories were changed between $1990-91$ and 1993-94, making it difficult to compare certification patterns between the two years.

[^57]:    ${ }^{82}$ Vocational teachers were slightly less likely than academic teachers to be Hispanic in 1990-91, although this difference was not significant in 1993-94.

[^58]:    ${ }^{83}$ The survey did not specify what methods were taught or what topic was studied in depth.

[^59]:    ${ }^{84}$ The survey did not ask teachers how they changed their teaching practices, only whether they did so.

[^60]:    ${ }^{85}$ The difference in adult education participation between vocational teachers in vocational high schools and those in unspecified "other" high schools was large but not statistically significant; there were small sample sizes and large standard errors for these two groups.
    ${ }^{86}$ The difference in participation in inservices on the uses of educational technology between vocational teachers in vocational high schools and those in unspecified "other" high schools was somewhat large but not statistically significant; there were small sample sizes and large standard errors for these two groups.
    ${ }^{87}$ The previous comprehensive NCES publication on vocational education found that vocational teachers in vocational schools were more like than their counterparts in comprehensive high schools to teach in the trade and industry, technical, and health areas. See K. Levesque, et al., Vocational Education in the United States: The Early 1990s (NCES 95-024) (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 1995) p. 20.
    ${ }^{88}$ Vocational teachers in vocational schools were also more likely than their vocational colleagues in "other" schools to have less than a bachelor's degree.
    ${ }^{89}$ See "The State of Certification," Vocational Education Journal 68 (6) (September 1993): 30-35.

[^61]:    ${ }^{90}$ A second definition was also sometimes used: vocational specialists completed 4.0 or more credits in a single occupational program area, with 2.0 or more of these units taken beyond the introductory level. However, the report generally focuses on the first, less restrictive, definition of vocational concentrators.

[^62]:    ${ }^{91}$ HS\&B and NELS:88 did not specify types of certificates in the survey questions asked of respondents about degree attainment. The vast majority of these certificates, however, appear to have been awarded by 2 -year institutions.

[^63]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^64]:    ${ }^{92}$ Among 1982 graduates, however, vocational concentrators were statistically more likely than other/general graduates to enroll at community colleges. In addition, vocational concentrators who also completed a college preparatory curriculum were not more likely than strictly vocational concentrators or other/general graduates to enroll at public 4-year institutions.

[^65]:    ${ }^{93}$ Some research has shown that work experience while in school may have other benefits. For some students, work experience appears to reduce their risk of dropping out of high school. See, for example, D.R. Entwisle, K.L. Alexander, and L.S. Olson, Urban Teenagers: Work, Stopout and Dropout (Baltimore, MD: Johns Hopkins University, July 2, 1999).

[^66]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^67]:    ${ }^{94}$ The difference in average number of remedial credits earned between vocational concentrators who also completed a college preparatory curriculum and graduates who completed only a college preparatory curriculum was not statistically significant (1.0 versus 0.6 credits).

[^68]:    ${ }^{95}$ These groups had small sample sizes and large standard errors.
    ${ }^{96}$ Although 1982 and 1992 graduates with no work experience in high school appeared to have higher unemployment rates than those working 35 or more hours per week and those working full time, respectively, these differences were not statistically significant.

[^69]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^70]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.
    SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and Fourth Follow-up Survey.

[^71]:    ${ }^{97}$ Standard errors for female graduates were generally larger than for their male counterparts for the same columns and rows in tables 82 a and 82 b . This suggests that variability in labor market experiences was greater for female than male graduates.

[^72]:    ${ }^{98}$ The specific data elements that were available differed somewhat for each year of the survey.
    ${ }^{99}$ The first NPSAS survey in 1987 did not survey a comparable sample of students, so the trend analysis focuses on 1990 to 1996.
    ${ }^{100}$ The High School and Beyond (HS\&B) longitudinal study collected postsecondary transcript data for 1982 high school graduates. More recent postsecondary transcript data are not currently available.

[^73]:    ${ }^{101}$ In the analyses focusing on beginning postsecondary students (primarily in the Postsecondary Completion and Other Outcomes section), we included students who reported pursuing 4-year degrees in 1989-90, in order to compare outcomes for students working toward baccalaureate and subbaccalaureate credentials.
    ${ }^{102}$ The surveys generally did not specify the types of postsecondary certificates students were pursuing. For purposes of this report, all reported certificates were generally treated as subbaccalaureate certificates. However, some 4 -year and postbaccalaureate certificates (such as teaching certificates) may be included.
    ${ }^{103}$ The previous report in this series, Vocational Education in the United States: The Early 1990s, called this third category of majors "other" rather than "not reported."

[^74]:    ${ }^{104}$ The CPS surveys did not ask specifically about postsecondary certificate completion. It is, therefore, not possible to know whether adults completing a postsecondary certificate, but not an associate's or higher degree, included themselves in the "some college, no degree" or "college degree" category.

[^75]:    ${ }^{105}$ All differences among the three groups were statistically significant.
    ${ }^{106}$ The differences between whites and blacks and whites and Hispanics were statistically significant, but the difference between blacks and Hispanics was not.

[^76]:    ${ }^{107}$ There were substantial amounts of missing data on student's major field in both NPSAS surveys. About 24 percent of subbaccalaureate students in 1990 and 28 percent in 1996 did not report their major field.
    ${ }^{108}$ The CPS surveys did not specify whether the postsecondary certificates students were pursuing were subbaccalaureate certificates or 4-year or post-baccalaureate certificates (such as teaching certificates).

[^77]:    ${ }^{109}$ There were substantial amounts of missing data on student's major field in both NPSAS surveys. About 24 percent of subbaccalaureate students in 1989-90 and 28 percent in 1995-96 did not report their major field.

[^78]:    ${ }^{110}$ For simplicity's sake, this report refers to "black, non-Hispanic" students as "black" and "white, non-Hispanic" students as "white." However, it should be remembered that all Hispanic students, regardless of race, are included in the Hispanic group.

[^79]:    SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 and 1995-96 National Postsecondary Student Aid Study.

[^80]:    ${ }^{111}$ The "other vocational" category includes cosmetology, consumer/personal services, dental/medical technology, and legal assisting, among other miscellaneous fields.

[^81]:    NOTE: Percentages may not add to totals due to rounding.
    SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 and 1995-96 National Postsecondary Student Aid Study.

[^82]:    SOURCE: U.S. Department of Education, National Center for Education Statistics, 1989-90 Beginning Postsecondary Students

[^83]:    ${ }^{112}$ In this section, we included students who reported pursuing 4 -year degrees in $1989-90$, in order to be able to compare outcomes for students working toward baccalaureate and subbaccalaureate credentials.

[^84]:    ${ }^{113}$ Transferring is defined here as enrolling in a different institution from the first one and not returning, regardless of whether a credential was completed at the first institution or whether credits were transferred.

[^85]:    ${ }^{1}$ Occupational home economics combines personal and other services, food service and hospitality, and child care and education.
    ${ }^{2}$ Includes students who completed both a vocational concentration and a college preparatory curriculum.
    NOTE: Averages may not add to totals due to rounding. Row n's may not add to total n's because of missing data. Estimates appearing as 0.00 or 0.000 may be nonzero but less than 0.005 or 0.0005 .

    SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Sophomore Cohort 1982 High School Transcript Study and 1990 and 1994 National Assessment of Educational Progress High School Transcript Studies.

[^86]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^87]:    *Includes students who completed both a vocational concentration and a college preparatory curriculum.

[^88]:    NOTE: Percentages may not add to 100 due to rounding. Row n's may not add to total n's because of missing data.
