Acting Commissioner
The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to:

## Foreword

Projections of Education Statistics to 2011 is the 30th report in a series begun in 1964. This report provides revisions of projections shown in Projections of Education Statistics to 2010 and includes statistics on elementary and secondary schools and degreegranting institutions. Included are projections for enrollment, graduates, teachers, and expenditures to the year 2011.

In addition, this report includes projections of public elementary and secondary enrollment and high school graduates to the year 2011 at the state level. These projections were produced to provide researchers, policy analysts, and others with state-level projections developed using a consistent methodology. They are not intended to supplant detailed projections prepared in individual states.

The projections presented in this report reflect revisions influenced by the 1990 census, but exclude the net undercount of 4 to 5 million. The revised population projections developed by the Census Bureau also reflect the incorporation of the 1999 estimates as well as the latest assumptions for the fertility rate, net immigration, and the mortality rate. The population projections are not based on the 2000 census data. Projections of national population data are not scheduled for release until 2002.

This report contains a methodology section
describing models and assumptions used to develop the national and state projections. The projections are based on a cohort survival model, an age-specific enrollment rate model, exponential smoothing models, and econometric models. The cohort survival and enrollment rate models use enrollment data and population estimates and projections from the National Center for Education Statistics and Census Bureau. The exponential smoothing models are based on the mathematical projection of past data patterns into the future. The econometric models use projections of exogenous variables from the company, DRI•WEFA, Inc., an economic forecasting service. Therefore, assumptions regarding the population and the economy are the key factors underlying the projections of education statistics.

Most of the projections of education statistics include three alternatives, based on different assumptions about demographic and economic growth paths. Although the first alternative set of projections (middle alternative) in each table is deemed to represent the most likely projections, the low and high alternatives provide a reasonable range of outcomes.

In the forecast summary, highlights for key education statistics are presented. A summary of the projections is available in a pocket-sized folder, Pocket Projections 2011.

Valena W. Plisko, Associate Commissioner
Early Childhood, International, and Crosscutting Studies Division
August 2001

## Acknowledgments

Projections of Education Statistics to 2011 was produced by the National Center for Education Statistics in the Early Childhood, International, and Crosscutting Studies Division under the general direction of Thomas D. Snyder, Director of the Annual Reports Program. The report was prepared by Debra E. Gerald, Mathematical Statistician, and William J. Hussar, Financial Economist.

Debra E. Gerald prepared projections of the following: elementary and secondary enrollment (chapter 1); enrollment in degree-granting institutions (chapter 2); high school graduates (chapter 3); earned degrees conferred (chapter 4); and elementary and secondary teachers (chapter 5). In addition, she prepared the appendixes explaining the methodologies used to develop these projections and the data sources. William J. Hussar prepared the projections of expenditures of public elementary and secondary schools, including public school teacher salaries (chapter 6). In addition, he prepared the
appendix explaining the methodologies used to obtain the expenditure projections, selected portions of the data sources, and glossary.

The technical review was done by Shelley K. Burns of the National Center for Education Statistics and David Miller of the Education Statistics Services Institute (ESSI). Thea Kruger, Mary McLaughlin, and Molly Soule of ESSI assisted in the technical review of this report. The adjudication was done by Karen O'Conor, Adjudicator for the National Center for Education Statistics. Valuable assistance was also provided by the following reviewers: Lynda Del Castillo of Sallie Mae; Arlene Dohm of the Bureau of Labor Statistics; Vance Grant of the National Library of Education, Office of Educational Research and Improvement; and Stephen Broughman, William Fowler, Frank Morgan, and John Sietsema of the National Center for Education Statistics.

The cover was designed by Heather Block of the Education Statistics Services Institute (ESSI).

## Forecast Summary

## Highlights

Public and private elementary and secondary enrollment-less than 1 percent increase from 1999 to 2011.

Enrollment in degree-granting institutions-20 percent increase.

High school graduates-11 percent increase.

## Bachelor's degrees-18 percent increase.

Elementary and secondary teachers-10 percent increase.

## Current expenditures for public elementary and secondary schools-34 percent increase in constant dollars.

## Current expenditures per

 pupil-33 percent increase in constant dollars.Total public and private elementary and secondary enrollment is projected to increase from 52.9 million in 1999 to 53.4 million in 2005. Then total enrollment is projected to decrease to 53.0 million by 2011, an overall increase of less than 1 percent from 1999 (table 1).

Between 1999 and 2011, public elementary and secondary enrollment is projected to increase 8 percent in the West, while in the South it will increase 1 percent. In the Northeast and Midwest, enrollment is projected to decrease 4 and 3 percent, respectively, over the same period (table 5).

Enrollment in degree-granting institutions is projected to increase from 14.8 million in 1999 to 17.7 million by 2011, an increase of 20 percent. A 16 percent increase is projected under the low alternative and a 23 percent increase is projected under the high alternative (table 10).

High school graduates from public and private high schools are projected to increase from 2.8 million in 1998-99 to 3.1 million by 2010-11, an increase of 11 percent. This increase reflects the projected rise in the 18 -year-old population (table 23).

Between 1998-99 and 2010-11, the number of public high school graduates is projected to increase 20 percent in the West, while the South will increase 12 percent. The Northeast and the Midwest are projected to increase 11 and 2 percent, respectively, over the same period (table 25).

The number of bachelor's degrees is expected to increase from 1,184,000 in 1997-98 to $1,392,000$ by 2010-11, an increase of 18 percent (table 27).

Under the middle alternative, the number of elementary and secondary teachers is expected to increase from 3.30 million in 1999 to 3.65 million by the year 2011, an increase of 10 percent. A 9 percent increase is projected under the low alternative and an 11 percent increase is projected under the high alternative (table 31).

Under the middle alternative, a 34 percent increase in current expenditures for public elementary and secondary schools is projected for the period from 1998-99 to 2010-11. Under the low alternative, current expenditures are projected to increase by 29 percent; under the high alternative, current expenditures are projected to increase by 40 percent (table 33 ).

Under the middle alternative, current expenditures per pupil in fall enrollment are forecast to increase 33 percent in constant dollars from 1998-99 to 2010-11 (table 33).

## Figures

## Births

1. Annual number of births, with projections: 1951 to 2011 ..... 6
School-Age Population
2. Three- to five-year-old population, with projections: 1986 to 2011 ..... 6
3. School-age populations, with projections: 1986 to 2011 ..... 7
Elementary and Secondary Schools
4. Enrollment in elementary and secondary schools, by grade level, with projections: Fall 1986 to fall 2011 ..... 7
5. Enrollment in elementary and secondary schools, by control of institution, with projections: Fall 1986 to fall 2011 ..... 8
6. Enrollment in public elementary and secondary schools, by selected grade, with projections: Fall 1991 to fall 2011 ..... 8
7. Percent change in grades K-12 enrollment in public schools, by state: Fall 1999 to fall 2011 ..... 9
8. Percent change in public K-12 enrollment, by region: Fall 1999 to fall 2011 ..... 9
9. Percent change in grades K-8 enrollment in public schools, by state: Fall 1999 to fall 2011 ..... 10
10. Percent change in public K-8 enrollment, by region: Fall 1999 to fall 2011 ..... 10
11. Percent change in grades 9-12 enrollment in public schools, by state: Fall 1999 to fall 2011 ..... 11
12. Percent change in public 9-12 enrollment, by region: Fall 1999 to fall 2011 ..... 11
College-Age Population
13. College-age populations, (18-24 years and 25-29 years), with projections: 1986 to 2011 ..... 28
14. College-age populations, (30-34 years and 35-44 years), with projections: 1986 to 2011 ..... 28
Degree-Granting Institutions
15. Enrollment in degree-granting institutions, with alternative projections: Fall 1986 to fall 2011 ..... 29
16. Average annual growth rates for total enrollment in degree-granting institutions: Fall 1986 to fall 2011 ..... 29
17. Enrollment in degree-granting institutions, by sex, with middle alternative projections: Fall 1986 to fall 2011 ..... 30
18. Average annual growth rates for total enrollment in degree-granting institutions, by sex: Fall 1986 to fall 2011 ..... 30
19. Enrollment in degree-granting institutions, by attendance status, with middle alternative projections: Fall 1986 to fall 2011 ..... 31
20. Average annual rates of change for total enrollment in degree-granting institutions, by attendance status: Fall 1986 to fall 2011 ..... 31
21. Enrollment in degree-granting institutions, by control of institution, with alternative projections: Fall 1986 to fall 2011 ..... 32
22. Average annual growth rates for total enrollment in degree-granting institutions, by control of institution: Fall 1986 to fall 2011 ..... 32
23. Enrollment in degree-granting institutions, by type of institution, with alternative projections: Fall 1986 to fall 2011 ..... 33
24. Average annual growth rates for total enrollment in degree-granting institutions, by type of institution:
Fall 1986 to 2011 ..... 33
25. Undergraduate enrollment in degree-granting institutions, with alternative projections:
Fall 1986 to fall 2011 ..... 34
26. Average annual growth rates for undergraduate enrollment in degree-granting institutions:
Fall 1986 to fall 2011 ..... 34
27. Postbaccalaureate enrollment in degree-granting institutions, with alternative projections: Fall 1986 to fall 2011 ..... 35
28. Average annual growth rates for postbaccalaureate enrollment in degree-granting institutions:
Fall 1986 to fall 2011 ..... 35
29. Full-time-equivalent enrollment in degree-granting institutions, with alternative projections: Fall 1986 to fall 2011 ..... 36
30. Average annual growth rates for full-time-equivalent enrollment in degree-granting institutions:
Fall 1986 to fall 2011 ..... 36
31. Enrollment in degree-granting institutions, by age group, with middle alternative projections: Fall 1991, 2001, and 2011 ..... 37
32. Enrollment of men in degree-granting institutions, by age group, with middle alternative projections: Fall 1991, 2001, and 2011 ..... 38
33. Enrollment of women in degree-granting institutions, by age group, with middle alternative projections: Fall 1991, 2001, and 2011 ..... 38

## High School Graduates

34. Eighteen-year-old population, with projections: 1986 to 2011 ..... 55
35. High school graduates, with projections: 1985-86 to 2010-11 ..... 55
36. High school graduates, by control of institution, with projections: 1985-86 to 2010-11 ..... 56
37. Average annual rates of change for high school graduates: 1985-86 to 2010-11 ..... 56
38. Percent change in number of public high school graduates, by state: 1998-99 to 2010-11 ..... 57
39. Percent change in number of public high school graduates, by region: 1998-99 to 2010-11 ..... 57
Earned Degrees Conferred
40. Associate's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 65
41. Bachelor's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 65
42. Master's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 66
43. Doctor's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 66
44. First-professional degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 67
Elementary and Secondary Teachers
45. Elementary and secondary teachers, with alternative projections: Fall 1986 to fall 2011 ..... 75
46. Average annual growth rates for elementary and secondary teachers: Fall 1986 to fall 2011 ..... 75
47. Elementary and secondary teachers, by organizational level, with middle alternative projections: Fall 1986 to fall 2011 ..... 76
48. Average annual growth rates for elementary and secondary teachers, by organizational level: Fall 1986 to fall 2011 ..... 76
49. Elementary and secondary teachers, by control of institution, with middle alternative projections: Fall 1986 to fall 2011 ..... 77
50. Average annual growth rates for elementary and secondary teachers, by control of institution: Fall 1986 to fall 2011 ..... 77
51. Pupil/teacher ratios in elementary and secondary schools, with middle alternative projections: Fall 1986 to fall 2011 ..... 78
52. Pupil/teacher ratios in elementary and secondary schools, by control of institution, with middle alternative projections: Fall 1986 to fall 2011 ..... 78
Expenditures
53. Current expenditures of public schools (in constant 1999-2000 dollars), with alternative projections: 1985-86 to 2010-11 ..... 84
54. Current expenditures per pupil in fall enrollment in public schools (in constant 1999-2000 dollars), with alternative projections: 1985-86 to 2010-11 ..... 84
55. Annual percentage change in current expenditures per pupil in fall enrollment in public schools (in constant dollars), with alternative projections: 1985-86 to 2010-11 ..... 85
56. Annual percentage change in current expenditures per pupil in fall enrollment in public schools, disposable income per capita, and education revenue receipts from state sources per capita (all in constant dollars), with middle alternative projections: 1985-86 to 2010-11 ..... 85
57. Estimated average annual salaries of teachers in public schools (in constant 1999-2000 dollars), with alternative projections: 1985-86 to 2010-11 ..... 86
58. Annual percentage change in estimated average annual salaries of teachers in public schools (in constant dollars), with alternative projections: 1985-86 to 2010-11 ..... 86
59. Annual percentage change in estimated average annual salaries of teachers and current expenditures per pupil in fall enrollment of public schools, with middle alternative projections: 1985-86 to 2010-11 ..... 87

## Tables

## Enrollment

## Elementary and Secondary Schools

1. Enrollment in grades K-8 and 9-12 of elementary and secondary schools, by control of institution, with projections: Fall 1986 to fall 2011 ..... 12
2. Enrollment in elementary and secondary schools, by organizational level and control of institution, with projections: Fall 1986 to fall 2011 ..... 13
3. Enrollment in public elementary and secondary schools, by grade, with projections: Fall 1991 to fall 2011 ..... 14
4. Enrollment in grades K-12 in public elementary and secondary schools, by region and state, with projections: Fall 1993 to fall 2011 ..... 15
5. Percent change in grades K-12 enrollment in public schools, by region and state, with projections: Fall 1993 to fall 2011 ..... 17
6. Enrollment in grades K-8 in public schools, by region and state, with projections: Fall 1993 to fall 2011 ..... 18
7. Percent change in grades $\mathrm{K}-8$ enrollment in public schools, by region and state, with projections: Fall 1993 to fall 2011 ..... 20
8. Enrollment in grades 9-12 in public schools, by region and state, with projections: Fall 1993 to fall 2011 ..... 21
9. Percent change in grades $9-12$ enrollment in public schools, by region and state, with projections: Fall 1993 to fall 2011 ..... 23

## Degree-Granting Institutions

10. Total enrollment in all degree-granting institutions, by sex, attendance status, and control of institution, with alternative projections: Fall 1986 to fall 2011 ..... 39
11A. Total enrollment in all degree-granting institutions, by sex, age, and attendance status: Fall 1986 to fall 1999 ..... 40
11B. Total projected enrollment in all degree-granting institutions, by sex, age, and attendance status, with middle alternative projections: Fall 2000 to fall 2011 ..... 41
11. Total enrollment in all degree-granting institutions, by sex, age, and attendance status, with low alternative projections: Fall 1991, 1996, 1999, 2006, and 2011 ..... 42
12. Total enrollment in all degree-granting institutions, by sex, age, and attendance status, with high alternative projections: Fall 1991, 1996, 1999, 2006, and 2011 ..... 43
13. Total enrollment in all degree-granting institutions, by sex and attendance status, with alternative projections: Fall 1986 to fall 2011 ..... 44
14. Total enrollment in public 4-year degree-granting institutions, by sex and attendance status, with alternative projections: Fall 1986 to fall 2011 ..... 45
15. Total enrollment in public 2-year degree-granting institutions, by sex and attendance status, with alternative projections: Fall 1986 to fall 2011 ..... 46
16. Total enrollment in private 4-year degree-granting institutions, by sex and attendance status, with alternative projections: Fall 1986 to fall 2011 ..... 47
17. Total enrollment in private 2-year degree-granting institutions, by sex and attendance status, with alternative projections: Fall 1986 to fall 2011 ..... 48
18. Total undergraduate enrollment in all degree-granting institutions, by sex, attendance status, and control of institution, with alternative projections: Fall 1986 to fall 2011 ..... 49
19. Total graduate enrollment in all degree-granting institutions, by sex, attendance status, and control of institution, with alternative projections: Fall 1986 to fall 2011 ..... 50
20. Total first-professional enrollment in all degree-granting institutions, by sex, attendance status, and control of institution, with alternative projections: Fall 1986 to fall 2011 ..... 51
21. Total full-time-equivalent enrollment in all degree-granting institutions, by control and type of institution, with alternative projections: Fall 1986 to fall 2011 ..... 52
High School Graduates
22. High school graduates, by control of institution, with projections: 1985-86 to 2010-11 ..... 58
23. High school graduates in public schools, by region and state, with projections: 1992-93 to 2010-11 ..... 59
24. Percent change in number of public high school graduates, by region and state, with projections: 1992-93 to 2010-11 ..... 61

## Earned Degrees Conferred

26. Associate's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 68
27. Bachelor's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 69
28. Master's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 70
29. Doctor's degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 71
30. First-professional degrees, by sex of recipient, with projections: 1985-86 to 2010-11 ..... 72
Teachers
Elementary and Secondary Schools
31. Elementary and secondary teachers, by control of institution and organizational level, with alternative projections: Fall 1986 to fall 2011 ..... 79
32. Pupil/teacher ratios in elementary and secondary schools, by control of institution, with alternative projections: Fall 1986 to fall 2011 ..... 80
Expenditures
Public Elementary and Secondary Schools
33. Current expenditures and current expenditures per pupil in fall enrollment in public elementary and secondary schools, with alternative projections: 1985-86 to 2010-11 ..... 88
34. Current expenditures and current expenditures per pupil in average daily attendance (ADA) in public elementary and secondary schools, with alternative projections: 1985-86 to 2010-11 ..... 89
35. Estimated average annual salaries of classroom teachers in public elementary and secondary schools, with alternative projections: 1985-86 to 2010-11 ..... 90

## Appendix A

## Methodological Tables

## Enrollment

A1. Summary of forecast assumptions to 2011 ..... 96
A2. Mean absolute percentage errors (MAPEs) by lead time for selected statistics in public elementary and secondary schools and degree-granting institutions ..... 97
A1.1. College enrollment rates, by age, sex, and attendance status, with middle alternative projections: Fall 1999, 2006, and 2011 ..... 103
A1.2. Equations for full-time and part-time college enrollment rates of men ..... 104
A1.3. Equations for full-time and part-time college enrollment rates of women ..... 105
A1.4. Enrollment rates in public schools, by grade level: Fall 1999, 2006, and 2011 ..... 106
A1.5. Public school grade progression rates: fall 1999, 2006, and 2011 ..... 106
A1.6. Full-time enrollment, by level enrolled and type of institution, as a percent of total enrollment, for each age and sex classification: Fall 1999, 2006, and 2011 ..... 107
A1.7. Part-time enrollment, by level enrolled and type of institution, as a percent of total enrollment, for each age and sex classification: Fall 1999, 2006, and 2011 ..... 108
A1.8. Public college enrollment as a percent of total enrollment, by attendance status, sex, level enrolled, and type of institution: Fall 1999, 2006, and 2011 ..... 109
A1.9. Graduate enrollment as a percent of total postbaccalaureate enrollment, by sex, attendance status, and type and control of institution: Fall 1999, 2006, and 2011 ..... 109
A1.10. Full-time-equivalent of part-time enrollment as a percent of part-time enrollment, by level enrolled and by type and control of institution: Fall 1999, 2006, and 2011 ..... 109
A1.11. Number of years, projection methods, and smoothing constants used to project public school enrollment and high school graduates, by state ..... 109
A1.12. Enrollment (assumptions) ..... 110
Earned Degrees Conferred
A3.1. Equations for earned degrees conferred ..... 114
A3.2. Earned degrees conferred (assumptions) ..... 115
Public Elementary and Secondary Teachers
A4.1. Equations for public elementary and secondary teachers ..... 119
Public Elementary and Secondary School Expenditures
A5.1. Equations for current expenditures per pupil in fall enrollment, estimated average annual salaries of teachers, and education revenue receipts from state sources ..... 127
Appendix B
Supplementary Tables
B1. Annual number of births (U.S. Census projections, Middle Series): 1951 to 2011 ..... 131
B2. Preprimary school-age populations (U.S. Census projections, Middle Series): 1986 to 2011 ..... 132
B3. School-age populations (U.S. Census projections, Middle Series), ages 5, 6, 5 to13, and 14 to17 years: 1986 to 2011 ..... 133
B4. College-age populations (U.S. Census projections, Middle Series), ages 18, 18 to 24, 25 to 29, 30 to 34, and 35 to 44 years: 1986 to 2011 ..... 134
B5. Fall enrollment in public elementary and secondary schools, change in fall enrollment, the population, and fall enrollment as a proportion of the population: 1985-86 to 2010-11 ..... 135
B6. Macro-economic measures of the economy, with alternative projections: Fiscal year 1985-86 to 2010-11 ..... 136
B7. Measures of state and local government revenues, with alternative projections:
Fiscal year 1985-86 to 2010-11 ..... 137

E2. Response rates for degree-granting institutions from the Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment" survey: 1999159

## Introduction

## Guide to This Edition

This edition of Projections of Education Statistics to 2011 provides projections for key education statistics, including enrollment, graduates, teachers, and expenditures in elementary and secondary schools and enrollment and graduates of degree-granting institutions. Current-fund expenditures of degreegranting institutions are excluded from this edition because of lack of available data for recent years. The tables, figures, and text contain national data on enrollment, teachers, graduates, and expenditures for the past 14 years and projections to the year 2011. The tables, figures, and text contain state-level data on projections of public school elementary and secondary enrollment and public high school graduates to the year 2011. Similar methodologies were used to obtain a uniform set of projections for the 50 states and the District of Columbia. These projections are further adjusted to agree with the national projections of public elementary and secondary school enrollment and public high school graduates appearing in this report. These projections reflect 1999 population estimates and population projections based on the 1990 census, but are not adjusted for the 1990 net undercount of 4 to 5 million. The population projections are not based on the 2000 census data. Projections of national population data are not scheduled for release until 2002. Appendix A describes the methodology and assumptions used to develop the projections. Appendix B contains tables of supplementary data. Data sources are presented in appendix C. Appendix D is a glossary of terms. Appendix E describes the survey methodology of the 1999 Integrated Postsecondary Education Data System (Fall Enrollment).

## Limitations of Projections

Projections of time series usually differ from the final reported data due to errors from many sources. This is because of the inherent nature of the statistical universe from which the basic data are obtained and the properties of projection methodologies, which depend on the validity of many assumptions. Therefore, alternative projections are shown for most statistical series to denote the uncertainty involved in making projections. These alternatives are not statistical confidence limits, but instead represent judgments made by the authors as to reasonable upper and lower bounds. The mean absolute percentage error is one way to express the forecast accuracy of past projections. This measure expresses the average value of the absolute value of errors in percentage terms. For example, the mean absolute percentage errors of public school enrollment in grades $\mathrm{K}-12$ for lead times of $1,2,5$, and 10 years were $0.2,0.5,1.2$, and 2.9 percent, respectively. On the other hand, mean absolute percentage errors for doctor's degrees for lead times of 1,2 , and 5 years were 2.0 , 2.8, and 3.7 percent respectively. For more information on mean absolute percentage errors, see table A2, page 97.

Alternative projections are presented for enrollment in degree-granting institutions, earned degrees conferred, elementary and secondary teachers, and expenditures of public elementary and secondary schools.

## Chapter 1

# Elementary and Secondary Enrollment 

National

Projections show public and private elementary and secondary school enrollments having peaked in Fall 2000 at a record level. The record 2000 enrollment reflects an increase of 14 percent since fall 1990. Further small enrollment increases are expected between 2000 and 2005, followed by small enrollment declines for most of the years between 2005 and 2011 (table 1). The primary reason for the continuing increase over the first 5 years is the rise in the number of annual births between 1977 and 1990-sometimes referred to as the baby boom echo (appendix table B1 and figure 1). After small declines and a period of stability from 1991 to 1997, the number of births has begun rising again. Reflecting this, the 3 - to 5 -year-old population is projected to increase 4 percent by 2011 (appendix table B2 and figure 2). Increases in the 5to 13 -year-old population from 1999 to 2002 and decreases from 2003 to 2008, followed by slight increases in 2009 to 2011 are expected to cause rises in K-8 enrollment in 2001 and decreases through 2008 and then increases to 2011. Over the next decade, elementary enrollment is projected to remain at the high levels evident in the late 1990s (figure 4). Growth in the 14- to 17 -year-old population to 2007 and decline through 2011 will continue to influence growth in grades 9 through 12 enrollment through 2006. Between 2000 and 2011 enrollment in secondary schools is projected to exceed enrollment in the late 1990s.

## Enrollment, by Grade Group

Enrollment in grades K-8 increased from 34.0 million in 1990 to approximately 38.1 million in 2000, an increase of 12 percent. Enrollment in grades K-8 is projected to increase slightly to 38.2 million in 2001, and then decrease slowly through 2008 to 37.4 million. Thereafter, elementary enrollment is expected to begin increasing again, rising to 37.7 million by 2011 (table 1 and figure 4).

Enrollment in grades 9-12 has risen from 12.5 million in 1990 to a projected 14.8 million in 2000, an increase of 18 percent. Thereafter, enrollment in
grades 9-12 is projected to rise to 15.9 million in 2006, before decreasing slightly to 15.3 million by 2011 , an increase of 4 percent from 2000. In the year 2005, enrollment in grades 9-12 is projected to reach an alltime record of 15.8 million, surpassing the previous high of 15.7 million in fall 1976.

## Enrollment, by Control of School

Enrollment in public elementary and secondary schools increased from 39.8 million in 1986 to 46.9 million in 1999, an increase of 18 percent (figure 5). Enrollment in public schools is projected to rise slightly over the next 6 years, then decrease slightly over most of the following 6 years (table 2). In 2011, public school enrollment is projected to be 47.2 million.

Since the mid-1980s, enrollment in private elementary and secondary schools has fluctuated between 5.2 million and 6.0 million. In fall 2000, an estimated 5.9 million students will be enrolled in private elementary and secondary schools. Enrollment in private schools is projected to remain around that level between 2000 and 2011.

## Public School Enrollment, by Grade

Between 2000 and 2011, public school enrollment in grades K-12 is projected to remain virtually unchanged. However, projections of public school enrollment by grade will vary over the projection period (table 3 and figure 6). Enrollment in grade 1 is projected to decrease through 2002 and then increase slightly through 2011. Enrollment in grade 4 is expected to decrease through 2005 and then increase through 2011. Enrollment in grade 8 is projected to increase to 2003 and then decrease to 2011. Enrollment in grade 12 is expected to increase through 2007 and then decrease to 2011.

## Methodology

Enrollment rates for the school-age populations are nearly 100 percent for elementary grades and junior-high grades and close to 90 percent for high school grades. Thus, the historical and projected patterns of decline and growth in enrollment in grades K-8 and grades 9-12 are strongly correlated with changes in the sizes of the 5 - to 13 -year-old population and the $14-$ to 17 -year-old population. Projections of enrollments in public and private elementary and secondary schools are based on projected grade progression rates. The grade progression rates for grades 2 through 10 are all close to 100 percent. Rates for grade 6 to grade 7 and grade 8 to grade 9 are significantly over 100 percent. Traditionally, these are the grades in which large numbers of elementary students transfer to public/private secondary schools. The progression rates for grades 10 to 11 and 11 to 12 are about 90 percent. The grade progression rates are assumed to be constant over the projection period

Projections of public elementary and secondary enrollment that have been produced over the last 18 years are more accurate than projections of public high school graduates and public classroom teachers that NCES has published over the same time period. For more information, see table A2, page 97.

## State

Public elementary and secondary school enrollment is projected to rise less than 1 percent between 1999 and the year 2011, but growth will vary widely across the nation (table 4 and figure 7). Enrollment will increase in the Western and Southern regions, where public school enrollment is expected to rise 8 percent and 1 percent, respectively. A decrease of 4 percent is projected for the Northeastern region, while a decrease of 3 percent is expected in the Midwestern region (table 5 and figure 8).

## Public School Enrollment

Over the projection period, public school enrollment is expected to vary across states. All of the states in the Northeast except New Jersey will have enrollment decreases. Decreases will occur in Connecticut (6 percent), Maine (6 percent), Massachusetts ( 5 percent), New Hampshire ( 0.9 percent), New York (5 percent), Pennsylvania (6 percent), Rhode Island (7 percent), and Vermont (3 percent).

In the Midwest, public school enrollment will
decrease in all states between 1999 and 2011. Decreases are projected for Illinois ( 0.4 percent), Indiana ( 0.7 percent), Iowa ( 5 percent), Kansas ( 1 percent), Michigan (7 percent), Minnesota (4 percent), Missouri ( 2 percent), Nebraska (1 percent), North Dakota (7 percent), Ohio ( 6 percent), South Dakota (2 percent), and Wisconsin (3 percent).

Public school enrollment increases are projected for seven of the 17 Southern states between 1999 and 2011. Increases are projected for Delaware (1.3 percent), District of Columbia (1 percent), Georgia (7 percent), Maryland ( 0.9 percent), Tennessee ( 2 percent), Texas ( 7 percent), and Virginia ( 4 percent). Decreases in enrollment have been projected for Alabama ( 1 percent), Arkansas (4 percent), Florida (1 percent), Kentucky ( 6 percent), Louisiana (4 percent), Mississippi ( 2 percent), North Carolina ( 2 percent), Oklahoma ( 8 percent), South Carolina ( 4 percent), and West Virginia ( 10 percent).

All of the 13 states in the West are expected to show increases in public school enrollment between 1999 and 2011. Increases are expected in Alaska (13 percent), Arizona ( 10 percent), California ( 7 percent), Colorado (7 percent), Hawaii (12 percent), Idaho (17 percent), Montana ( 5 percent), Nevada ( 13 percent), New Mexico (14 percent), Oregon (1 percent), Utah ( 8 percent), Washington ( 3 percent), and Wyoming ( 8 percent).

## Public Elementary Enrollment

Between 1999 and 2011, public elementary school enrollment in kindergarten through grade $8(\mathrm{~K}-8)$ is expected to decrease by 1 percent. However, public school elementary enrollment is projected to increase in 20 states (table 6 and figure 9). These expected increases in elementary enrollment are a reflection of immigration and the relatively high level of births in the 1990s, rather than changes in the attendance rates of young children. The NCES projections do not account for enrollment increases that may be caused by changing state and local policies about the provision of prekindergarten and kindergarten programs. Expansion of these programs could lead to higher enrollments at the elementary school level.

Public school elementary enrollment is expected to show a decrease of 7 percent in the Northeast between 1999 and 2011 (table 7 and figure 10). All states are expected to show decreases. These decreases are projected for Connecticut (10 percent), Maine (4 percent), Massachusetts ( 8 percent), New Hampshire ( 3 percent), New Jersey ( 4 percent), New York ( 8 percent), Pennsylvania (7 percent), Rhode Island (9 percent), and Vermont ( 2 percent).

A decrease of 4 percent in public school elementary enrollment has been projected for the

Midwestern region between 1999 and 2011. Nine of the twelve states in this region are projected to show decreases. These will occur in Illinois (4 percent), Indiana ( 2 percent), Iowa ( 4 percent), Michigan ( 8 percent), Minnesota ( 3 percent), Missouri ( 2 percent), North Dakota ( 1 percent), Ohio ( 6 percent), and Wisconsin (3 percent). Increases are expected for Kansas ( 0.5 percent), Nebraska ( 2 percent), and South Dakota ( 4 percent).

A decrease of 1 percent is expected for the Southern region between 1999 and 2011. Thirteen of the 17 states are projected to show decreases. Decreases are projected for Alabama ( 2 percent), Arkansas (4 percent), Delaware (1 percent), District of Columbia ( 0.1 percent), Florida ( 4 percent), Kentucky (7 percent), Louisiana ( 2 percent), Maryland (2 percent), Mississippi ( 2 percent), North Carolina ( 6 percent), Oklahoma ( 6 percent), South Carolina ( 6 percent), and West Virginia ( 9 percent). Increases are expected in Georgia (4 percent), Tennessee (1 percent), Texas ( 6 percent), and Virginia ( 0.4 percent).

Public school elementary enrollment in the Western states is projected to increase by 6 percent between 1999 and 2011. All of the 13 states are projected to show increases. Over the projection period, enrollment increases are projected for Alaska (14 percent), Arizona (6 percent), California (6 percent), Colorado ( 5 percent), Hawaii ( 14 percent), Idaho (20 percent), Montana (10 percent), Nevada (3 percent), New Mexico ( 17 percent), Oregon (2 percent), Utah (11 percent), Washington (3 percent), and Wyoming (18 percent).

## Public High School Enrollment

Between 1999 and 2011, enrollment in public high schools (grades 9 through 12) is expected to increase by 5 percent (table 8 and figure 11). Over the projection period, enrollment increases are projected in all of the regions except the Midwest.

The Northeast public high school enrollment is projected to increase by 3 percent between 1999 and 2011 (table 9 and figure 12). Increases are expected in Connecticut ( 5 percent), Massachusetts ( 5 percent), New Hampshire (3 percent), New Jersey (13 percent), and New York (3 percent). Decreases are projected for Maine ( 10 percent), Pennsylvania (1 percent), Rhode Island (1 percent), and Vermont ( 7 percent).

The Midwestern region is expected to show a decrease of 1 percent in public high school enrollment between 1999 and 2011. Decreases are projected in Iowa ( 6 percent), Kansas ( 5 percent), Michigan ( 3 percent), Minnesota (6 percent), Missouri (0.2 percent), Nebraska ( 6 percent), North Dakota (18 percent), Ohio (4 percent), South Dakota ( 15 percent), and Wisconsin (4 percent). Enrollment increases are expected in Illinois ( 9 percent) and Indiana (3 percent).

Between 1999 and 2011, public high school enrollment in the South is projected to increase by 5 percent. Over the projection period, increases are expected in Delaware (7 percent), District of Columbia ( 5 percent), Florida ( 8 percent), Georgia ( 17 percent), Maryland ( 8 percent), Mississippi ( 0.2 percent), North Carolina ( 11 percent), Tennessee ( 6 percent), Texas ( 9 percent) and Virginia (11 percent). Decreases are expected for Alabama ( 0.1 percent), Arkansas (4 percent), Kentucky ( 6 percent), Louisiana ( 9 percent), Oklahoma ( 12 percent), South Carolina ( 0.7 percent), and West Virginia ( 12 percent).

The Western region's public high school enrollment is expected to increase by 11 percent between 1999 and 2011. Between 1999 and 2011, increases have been projected for Arizona (21 percent), California ( 12 percent), Colorado (11 percent), Idaho (10 percent), and Nevada ( 42 percent). Other enrollment increases are expected for Alaska (9 percent), Hawaii ( 5 percent), New Mexico ( 9 percent), Utah ( 2 percent), and Washington ( 3 percent). Decreases are expected for Montana ( 5 percent), Oregon ( 0.6 percent), and Wyoming ( 12 percent).

${ }^{1}$ Includes most kindergarten and some nursery school enrollment.
${ }^{2}$ Private school numbers are estimated on the basis of past data.
${ }^{3}$ Private school numbers are from the Private School Universe Survey.
${ }^{4}$ Private school numbers are interpolated.
NOTE: Some data have been revised from previously published figures. For private schools, it was assumed that numbers for elementary are the same as those in table 1 for grades $\mathrm{K}-8$, and numbers for secondary are the same as those in table 1 for grades $9-12$. Designation of grades as elementary or secondary varies from school to school. Detail may not sum to totals due to rounding. Mean absolute percentage errors of selected education statistics can be found in table A2. SOURCE: U.S. Department of Education, National Center for Education Statistics,Statistics of Public Elementary and Secondary Schools; Common Core of Data surveys; Private School Universe Survey, various years; and National Elementary and Secondary Enrollment Model. (This table was prepared May 2001.)

## Chapter 2

# Enrollment in Degree-Granting Institutions 

Overall enrollment in degree-granting institutions* is expected to rise between 1999 and the year 2011. Changes in age-specific enrollment rates and college-age populations will affect enrollment levels over the next 12 years (figures 13 and 14). The most important factor in the projected rise of college enrollment is the projected increase of 17 percent in the traditional college-age population of 18 - to 24 -year-olds from 1999 to 2011 (appendix table B4). The 25 - to 29 -year-old population is projected to decrease by 5 percent between 1999 and 2002, and then increase by 15 percent between 2002 and 2011, for a net increase of 10 percent. The 30 - to 34 -year-old population will decrease by 8 percent between 1999 and 2007 and then increase 8 percent by 2011. The $35-$ to 44 -year-old population will remain stable between 1999 and 2000, and then decrease by 13 percent between 2000 and 2011. The increases in the younger population are expected to more than offset the loss of students from the older populations, thereby contributing to the increases in college enrollment over the projection period. The enrollment projections do not take into account such factors as the cost of a college education, the economic value of an education, and the impact of distance learning due to technological changes. These factors may produce changes in enrollment levels. Projections of college enrollment that have been produced over the past 6 years are more accurate than projections of doctor's degrees, but less accurate than projections of public elementary and secondary enrollment that NCES has published over the same time period. For more information, see table A2, page 97.

## Total College Enrollment

College enrollment increased from 12.5 million in 1986 to 14.5 million in 1992. Then it decreased to 14.3 million in 1993 and remained fairly stable through

[^0]1995. Thereafter, it increased to 14.8 million in 1999 (table 10 and figure 15). Under the middle alternative, college enrollment is projected to rise to 17.7 million by the year 2011, an increase of 20 percent from 1999.

Under the low alternative, college enrollment is projected to increase from 14.8 million in 1999 to 17.2 million by the year 2011, an increase of 16 percent over the projection period.

Under the high alternative, college enrollment is expected to increase from 14.8 million in 1999 to 18.2 million by the year 2011, an increase of 23 percent over the projection period.

## Enrollment, by Sex of Student

Women played a major role in the increase of enrollment between 1986 and 1999. The enrollment of women in college increased from 6.6 million in 1986 to 8.3 million in 1999, a 25 -percent increase over the period (figure 17). Under the middle alternative, enrollment of women is expected to increase to 10.3 million by the year 2011, an increase of 24 percent from 1999. As a share of total college enrollment, women were 56 percent of all college students in 1999 compared with 53 percent in 1986. Women's share of college enrollment will be 58 percent in the year 2011.

The enrollment of men in college increased from 5.9 million in 1986 to 6.5 million in 1992, before decreasing to 6.3 million in 1995. Thereafter, it increased to 6.5 million in 1999. Under the middle alternative, enrollment of men is expected to increase to 7.4 million by the year 2011, a 14 -percent increase from 1999.

## Enrollment, by Attendance Status

Full-time enrollment increased from 7.1 million in 1986 to 8.8 million in 1999 (figure 19). This is an increase of 23 percent over the period. Under the middle alternative, full-time enrollment is expected to increase another 22 percent to 10.7 million by the year 2011.

Part-time enrollment increased from 5.4 million in

1986 to 6.0 million in 1999, an increase of 12 percent over the period. Under the middle alternative, part-time enrollment is expected to increase to 6.9 million by the year 2011, an increase of 16 percent over the projection period.

## Enrollment, by Age

The alternative projections of higher education enrollment by age, sex, and attendance status are shown in tables 11A and 11B (middle alternative), table 12 (low alternative), and table 13 (high alternative). Projections of college attendance rates appear in appendix table A1.1. These projections are based on age-specific enrollment data from the Bureau of the Census and enrollment data from NCES.

Under the middle alternative, the period from 1991 to 2011 will be one of change in the age distribution of college students. In contrast to recent patterns, younger students are expected to become more prevalent on college campuses. The enrollment of students who are 18- to 24 -years old increased from 8.1 million in 1991 to 8.8 million in 1999, an increase of 9 percent (tables 11 A and 11B and figure 31). This number is expected to increase to 10.8 million by the year 2011, an increase of 22 percent from 1999. As a result, the proportion of students who are 18 - to 24 -years old, which increased from 56 percent in 1991 to 60 percent in 1999, is projected to be 61 percent by the year 2011.

The enrollment of students who are 25 years and over decreased from 6.1 million in 1991 to an estimated 5.8 million in 1999, a decrease of 5 percent. This number is projected to be 6.7 million in 2011, an increase of 15 percent. The proportion of students 25 years old and over decreased from 43 percent in 1991 to 39 percent in 1999. This proportion is projected to be 38 percent by the year 2011 .

## Enrollment, by Control of Institution

Enrollment in public institutions grew from 9.7 million in 1986 to 11.4 million in 1992, and then decreased to 11.1 million in 1995 followed by a rise to 11.3 million in 1999, for a net increase of 16 percent over the period (figure 21). Under the middle alternative, public enrollment is expected to increase to 13.6 million by 2011, an increase of 20 percent over the projection period.

Enrollment in private institutions, which include not-for-profit and for-profit institutions, increased from 2.8 million in 1986 to 3.5 million in 1999, an increase of 25 percent over the period. Under the middle alternative, private enrollment is expected to increase to 4.1 million by 2011 , an increase of 18 percent over
the projection period.

## Enrollment, by Type and Control of Institution

Enrollment in public 4-year institutions increased from 5.3 million in 1986 to 6.0 million in 1999, an increase of 13 percent increase over the period (table 15). Under the middle alternative, this enrollment is expected to rise to 7.3 million by the year 2011, a 21-percent increase over the projection period.

Enrollment in public 2-year institutions rose from 4.4 million in 1986 to 5.3 million in 1999, an increase of 21 percent over the period (table 16). Under the middle alternative, enrollment in public 2-year institutions is expected to rise to 6.3 million by the year 2011, an 18-percent increase over the projection period.

Enrollment in private 4-year institutions increased from 2.5 million in 1986 to 3.2 million in 1999, an increase of 28 percent increase over the period (table 17). Under the middle alternative, this enrollment is expected to rise to 3.8 million by the year 2011, an 18-percent increase over the projection period.

Enrollment in private 2-year institutions decreased from 266,000 in 1986 to 253,000 in 1999, a decrease of 5 percent over the period (table 18). Under the middle alternative, enrollment in private 2 -year institutions is expected to rise to 305,000 by the year 2011, a 21-percent increase over the projection period.

## Enrollment, by Level

Undergraduate enrollment increased from 10.8 million in 1986 to 12.7 million in 1999, a 17-percent increase over the period (table 19 and figure 25). Under the middle alternative, undergraduate enrollment is expected to increase to 15.3 million by the year 2011, a 21 -percent increase over the projection period.

Graduate enrollment rose from 1.4 million in 1986 to 1.8 million in 1999, a 26 -percent increase over the period (table 20 and figure 27). Under the middle alternative, graduate enrollment is expected to increase to 2.0 million by the year 2011, a 13-percent increase over the projection period.

First-professional enrollment increased from 270,000 in 1986 to 303,000 in 1999, a 12-percent increase over the period (table 21 and figure 27). Under the middle alternative, first-professional enrollment is expected to increase to 342,000 by 2011. This represents a 13-percent increase from 1999.

## Full-Time-Equivalent Enrollment

Full-time-equivalent enrollment increased from 9.1 million in 1986 to 10.9 million in 1999, a 21-percent increase over the period (table 22 and figure 29). Under the middle alternative, full-time-equivalent enrollment is expected to increase to 13.2 million by the year 2011, a 21-percent increase over the projection period.

## Alternative Projections

College enrollment projections were based on projected enrollment rates, by age and sex, which were then applied to population projections by age and sex developed by the Bureau of the Census. The middle series population projections, which assume middle fertility and yearly net migration, were used.

Three sets of projections are presented for enrollment in degree-granting institutions to indicate a range of possible outcomes. Each set of projections is based on alternative assumptions. The middle
alternative is based on the base scenario of the economy developed by the company, DRI•WEFA, Inc., for the projections of disposable income and unemployment rates. Under the middle alternative, the higher education enrollment model interprets the college enrollment decision as a static, short-term economic decision, i.e., potential consumers for higher education weigh the economic costs before making a decision to study or work. Thus the model assumes that a representative student gives greater importance to current earnings potential over lifetime earning potential. The model has two explanatory variables, the unemployment rate and real disposable income. The unemployment rate serves as a proxy for the attractiveness of the current working environment. A weak labor market increases the attractiveness of a college education. Real disposable income captures a student's ability to afford the costs of attending college. These relationships are assumed through 2011. For more information, see appendix A, section A.1.

The low and high alternatives incorporate past errors of projections of college enrollment to provide other possible outcomes.

NOTE: Some data have been revised from previously published figures. Data by age are based on the distribution by age from the Bureau of the Census.
Data for 1999 were imputed using alternative procedures. (See Appendix E for more details.) Detail may not sum to totals due to rounding. Mean absolute
percentage errors of selected education statistics can be found in table A2.

## Chapter 3

## High School Graduates

## National

The number of high school graduates is projected to increase 11 percent over the projection period. Increases in the number of graduates are expected for both public and private schools. The significant rise in the number of graduates reflects the increase in the 18 -year-old population over the projection period, rather than changes in the graduation rates of 12th graders (figure 34).

However, projections of graduates could be impacted by changes in policies affecting graduation requirements. Projections of public high school graduates that have been produced over the past 18 years are less accurate than projections of public elementary and secondary enrollment, but more accurate than projections of earned degrees by level. For more information, see table A2, page 97.

## Total High School Graduates

A high school graduate is defined as an individual who has received formal recognition from school authorities, by the granting of a diploma, for completing a prescribed course of studies at the secondary school level. This definition does not include other high school completers, high school equivalency recipients, or other diploma recipients.

The number of high school graduates from public and private schools increased from 2.6 million in 1985-86 to 2.8 million in 1987-88 (table 23 and figure 35). Then, it decreased to 2.5 million in 1993-94, before increasing to 2.8 million in 1998-99. The total number of high school graduates is projected to rise to 3.1 million by 2010-11, an increase of 11 percent from 1998-99.

## High School Graduates, by Control of Institution

The number of graduates of public high schools increased from 2.4 million in 1985-86 to 2.5 million in 1987-88 (table 23 and figure 36). Then, it decreased to 2.2 million in 1993-94, before rising to 2.5 million in 1998-99. Over the projection period, public high
school graduates are projected to increase to 2.8 million by 2010-11, an increase of 11 percent from 1998-99.

The number of graduates of private high schools is projected to increase from an estimated 273,000 in 1998-99 to 298,000 by 2010-11, an increase of 9 percent.

## State

The expected 11 percent increase in public high school graduates will be reflected in many states, with 28 states showing increases (table 25 and figure 38). Projected trends in the number of public high school graduates by state could be impacted by changes in policies affecting graduation requirements.

The number of public high school graduates in the Northeast is expected to increase 11 percent between 1998-99 and 2010-11 (table 25 and figure 39). Large increases are expected in Connecticut ( 25 percent), Massachusetts (18 percent), New Hampshire (12 percent), and New Jersey ( 24 percent). Smaller increases are expected in New York ( 8 percent), Pennsylvania ( 3 percent), and Rhode Island (10 percent). Decreases are projected for Maine ( 9 percent) and Vermont ( 9 percent).

The number of public high school graduates in the Midwest is expected to increase by 2 percent between 1998-99 and 2010-11. Increases are expected in Illinois (18 percent), Indiana (3 percent), Michigan (3 percent), and Missouri (4 percent). Decreases are expected in Iowa ( 4 percent), Kansas ( 3 percent), Minnesota ( 0.9 percent), Nebraska ( 10 percent), North Dakota ( 22 percent), Ohio ( 2 percent), South Dakota ( 23 percent), and Wisconsin (3 percent).

Between 1998-99 and 2010-11, the number of public high school graduates in the South will increase by 12 percent. Increases are expected in Delaware ( 7 percent), District of Columbia (18 percent), Florida ( 28 percent), Georgia ( 28 percent), Maryland ( 17 percent), North Carolina ( 28 percent), Tennessee ( 16 percent), Texas ( 15 percent), and Virginia ( 17 percent). Decreases are expected in Alabama ( 3 percent), Arkansas ( 5 percent), Kentucky ( 6 percent), Louisiana ( 9 percent), Mississippi ( 2 percent), Oklahoma ( 8 percent), South Carolina ( 0.7 percent), and West

## Virginia (18 percent).

The number of high school graduates in the West is expected to increase, rising by 20 percent. The largest increases are expected in Arizona ( 40 percent), California ( 26 percent), Colorado ( 21 percent), and Nevada ( 75 percent). Other increases are projected in

Alaska ( 8 percent), Idaho (2 percent), Oregon (6 percent), and Washington ( 8 percent). Decreases are projected for Hawaii (4 percent), Montana (16 percent), New Mexico (4 percent), Utah (5 percent), and Wyoming ( 27 percent).

Graduates Model. (This table was prepared May 2001.)

## Chapter 4

## Earned Degrees Conferred

Historical growth in higher education enrollment has led to a substantial increase in the number of earned degrees conferred. Just as the unprecedented rise in female enrollment contributed to the increased number of college students, so too has it boosted the number of degrees conferred. Between 1984-85 and 1997-98, the number of degrees awarded to women rose at all levels. In 1997-98, women earned the majority of associate's, bachelor's, and master's degrees, and more than two-fifths of doctor's and first-professional degrees. Over the projection period, the number of degrees awarded to women will rise at all levels. While degrees awarded to men are projected to increase at the bachelor's level, they will remain steady at the associate's, master's, doctor's, and firstprofessional levels.

Projections of earned degrees by level and sex were based primarily on college-age populations and college enrollment by level and by attendance status. Factors that affect future levels of earned degrees such as choice of degree, demand for occupations, etc. were not included in the projection models. NCES projections of earned degrees by level that have been produced over the last 6 years are less accurate than projections of public elementary and secondary enrollment. For more information, see table A2, page 97.

## Associate's Degrees

Between 1985-86 and 1987-88, the number of associate's degrees decreased from 446,047 to 435,085 . Then, it increased to 558,555 in 1997-98 (table 26 and figure 40 ). It is projected to increase to 625,000 by 2010-11, an increase of 12 percent from 1997-98. The number of associate's degrees awarded to men decreased from 196,166 in 1985-86 to 186,316 in 1988-89, before rising to 217,613 in 1997-98. This number is projected to increase to 226,000 by $2010-$ 11. The number of associate's degrees awarded to women fell from 249,881 in 1985-86 to 245,038 in 1987-88. Then, it increased to 340,942 in 1997-98, an increase of 36 percent from 1985-86. This number is projected to increase to 399,000 by $2010-11$, an increase of 17 percent from 1997-98.

## Bachelor's Degrees

The number of bachelor's degrees increased from 987,823 in 1985-86 to $1,184,406$ in 1997-98, an increase of 20 percent (table 27 and figure 41). This number is expected to increase to $1,392,000$ by $2010-$ 11, an increase of 18 percent from 1997-98. The number of bachelor's degrees awarded to men increased from 485,923 in 1985-86 to 477,203 in 1987-88. It increased to 532,881 in 1992-93. Then, this number decreased to 519,956 in 1997-98. This number is expected to decrease to 518,000 by 1998-99 and then increase to 568,000 by $2010-11$, an increase of 9 percent from 1997-98. The number of bachelor's degrees awarded to women increased from 501,900 in 1985-86 to 664,450 in 1997-98, an increase of 32 percent. This number is expected to increase to 824,000 by $2010-11$, an increase of 24 percent from 1997-98.

## Master's Degrees

The number of master's degrees increased from 288,567 in 1985-86 to 430,164 in 1997-98, an increase of 49 percent from 1985-86 (table 28 and figure 42). This number is expected to increase to 477,000 in 2010-11. The number of master's degrees awarded to men decreased from 143,508 in 1985-86 to 141,269 in 1986-87. Then it increased to 184,375 in 1997-98. This number is projected to decrease to 178,000 in 2000-01 and then rise to 190,000 by 201011. The number of master's degrees awarded to women increased from 145,059 in $1985-86$ to 245,789 in 1997-98. This number is expected to increase to 287,000 in 2010-11.

## Doctor's Degrees

The number of doctor's degrees increased from 33,653 in 1985-86 to 46,010 in 1997-98, an increase of 37 percent (table 29 and figure 43). This number is expected to increase to 49,100 in 2010-11. The number of doctor's degrees awarded to men increased from 21,819 in 1985-86 to 26,664 in 1997-98. This number is expected to increase to 27,600 by $2010-11$. The number of doctor's degrees awarded to women
rose from 11,834 in 1985-86 to 19,346 in 1997-98, an increase of 63 percent. The number of doctor's degrees awarded to women is projected to be 21,500 by 201011. The share of doctor's degrees awarded to women, which was 35 percent in 1985-86 and 42 percent in 1997-98, is projected to be 44 percent by 2010-11.

## First-Professional Degrees

A first-professional degree is one that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is based on a program requiring at least 2 academic years of work before entrance and a total of at least 6 years of work to complete the degree program, including both prior required college work and the professional program itself. These degrees include fields such as dentistry, medicine, pharmacy, law, and theological professions.

The number of first-professional degrees awarded decreased from 73,910 in 1985-86 to 70,735 in 198788. Then, it remained fairly steady in 1988-89 and 1989-90, before increasing to 78,598 in 1997-98 (table 30 and figure 44). This number is expected to increase to 88,300 by $2010-11$. The number of first-professional degrees awarded to men decreased from 49,261 in 1985-86 to 43,846 in 1990-91. Then, it increased to 45,153 in 1992-93 and then decreased to 44,911 in 1997-98. This number is projected to increase to 46,100 by $2010-11$. The number of first-professional degrees awarded to women increased from 24,649 in 1985-86 to 33,687 in 1997-98, an increase of 37 percent. This number is expected to increase to 42,200 by $2010-11$, an increase of 25 percent from 1997-98. The women's proportion of first-professional degrees rose from 33 percent in 1985-86 to 43 percent in 1997-98. By 2010-11, this proportion is expected to rise to 48 percent.

## Chapter 5

## Elementary and Secondary Teachers

Between 1999 and 2011, the number of teachers in elementary and secondary schools is projected to rise. The increase is related to the levels of enrollments and education revenue receipts from state sources per capita. Increases are expected in the numbers of both elementary and secondary teachers. The number of secondary teachers will increase at a faster rate than the number of elementary teachers. The numbers of both public and private teachers are projected to grow. The projections do not take into account increases in the number of teachers due to the effects of initiatives to reduce class sizes.

Three alternative projections of the numbers of elementary and secondary teachers were developed to indicate a range of possible outcomes. These alternatives are based on varying economic assumptions about the growth path for one of the key variables in the public school teacher modelseducation revenue receipts from state sources per capita. Under the middle alternative, education revenue receipts from state sources per capita is projected to increase by 14 percent between 1999 and 2011. The low alternative assumes that education revenue receipts from state sources per capita will increase by 11 percent over the projection period. The high alternative assumes that education revenue receipts from state sources per capita will increase by 16 percent during this period. The other variables in the teacher model are elementary enrollment and secondary enrollment in public schools. Between 1999 and 2011, secondary enrollment is projected to increase by 5 percent, while elementary will decrease around 2 percent (table 2). The enrollment variables are the same for all three alternatives.

## Elementary and Secondary School Teachers

The number of teachers in elementary and secondary schools increased from 2.59 million in 1986 to 3.30 million in 1999, an increase of 27 percent (table 31 and figure 45). Under the middle alternative, the number of teachers is projected to increase to 3.65 million by the year 2011, a 10 -percent increase over the projection period. Under the low alternative, the
number of teachers is projected to increase to 3.61 million by the year 2011. Under the high alternative, classroom teachers are projected to increase to 3.68 million by the year 2011.

The number of elementary teachers increased from 1.52 million in 1986 to 2.03 million in 1999 , an increase of 33 percent (figure 47). Under the middle alternative, the number of elementary teachers is projected to increase to 2.25 million by 2011, an increase of 11 percent from 1999. Under the low alternative, the number of elementary teachers is projected to increase to 2.22 million by the year 2011. Under the high alternative, elementary teachers are projected to increase to 2.27 million by the year 2011 .

The number of secondary teachers increased from 1.07 million in 1986 to 1.28 million in 1999, an increase of 19 percent. Under the middle alternative, the number of secondary teachers is projected to increase to 1.40 million by the year 2011, resulting in an increase of 10 percent. Under the low alternative, the number of secondary teachers is projected to increase to 1.39 million by the year 2011. Under the high alternative, secondary teachers are projected to increase to 1.41 million by the year 2011.

## Elementary and Secondary Teachers, by Control of School

The number of teachers in public elementary and secondary schools increased from 2.24 million in 1986 to 2.91 million in 1999 , an increase of 30 percent (table 31 and figure 49). Under the middle alternative, the number of teachers is projected to increase to 3.21 million by the year 2011, a 10-percent increase over the projection period. Under the low alternative, the number of classroom teachers is projected to increase to 3.17 million by the year 2011. Under the high alternative, classroom teachers are projected to increase to 3.23 million by the year 2011. Projections of elementary and secondary teachers in public schools that have been produced over the past 12 years are less accurate than projections of public elementary and secondary enrollment that NCES has published over the same period. For more information, see table A2, page 97.

The number of elementary and secondary teachers in private schools was an estimated 397,000 in 1999. Under the middle alternative, this number is projected to increase to 443,000 by the year 2011, an increase of 12 percent from 1999. Under the low alternative, the number of private school teachers is projected to increase to 438,000 by the year 2011. Under the high alternative, private school teachers are projected to increase to 447,000 by the year 2011 .

## Pupil/Teacher Ratios

A broad relationship between the number of pupils and teachers can be described by the pupil/teacher ratio. The pupil/teacher ratios presented in table 32 were computed based on elementary and secondary enrollment and the number of classroom teachers by control of institution.

The pupil/teacher ratio in elementary and secondary schools decreased from 17.4 in 1986 to 16.7 in 1989. It increased to 17.1 in 1992 followed by a decline to 16.0 in 1999 (table 32 and figure 51). Under the middle alternative, this ratio is projected to decline to 14.5 by the year 2011. Based on the low and high alternatives, the pupil/teacher ratio in elementary and secondary schools is expected to range between
14.4 and 14.7 in the year 2011.

Although private elementary and secondary teachers represented 12 percent of total elementary and secondary teachers in 1999, private school enrollment was 11 percent of total enrollment. This indicates that private schools have more teachers for a given number of students on average than do public schools; that is, private school pupil/teacher ratios are smaller than public school pupil/teacher ratios.

The pupil/teacher ratio in public elementary and secondary schools decreased from 17.7 in 1986 to 17.2 in 1990. It increased to 17.4 in 1993 and decreased to 16.1 in 1999 (figure 52). Under the middle alternative, the pupil/teacher ratio is projected to decrease to 14.7 in 2011. Based on the low and high alternatives, the pupil/teacher ratio in public elementary and secondary schools is projected to range between 14.6 and 14.9 in the year 2011.

For private elementary and secondary schools, the pupil/teacher ratio decreased from 15.7 in 1986 to 13.8 in 1989. Then it increased to 15.2 in 1999. Under the middle alternative, the pupil/teacher ratio is projected to decrease to 13.2 in 2011. Based on the low and high alternatives, the pupil/teacher ratio in private elementary and secondary schools is expected to range between 13.1 and 13.4 in the year 2011.

## Chapter 6

# Expenditures of Public Elementary and Secondary Schools 

Current expenditures and average annual teacher salaries in public elementary and secondary schools are both projected to increase in constant dollars between school years 1998-99 and 2010-11 in the middle set of projections presented in this chapter with current expenditures projected to increase more rapidly. (Note that all percent changes presented in this chapter were calculated using unrounded numbers.) These projections are based on assumptions concerning economic growth and assistance by state governments to local governments which are discussed in appendix A5. Other sets of projections, based on alternative economic scenarios, are also discussed. No projections for private schools are presented as there are no regular data collections for total private school expenditures.

There are many factors that may affect future school expenditures and teacher salaries that were not considered in the production of the projections presented in this chapter. These include recent policy initiatives to decrease classroom size and potential changes in the distribution of elementary and secondary teachers as older teachers retire and are replaced by younger teachers.

Recent NCES projections of current expenditures generally have been less accurate than the recent NCES projections of public elementary and secondary enrollment but more accurate than projections for teacher salaries. Projections of teacher salaries that have been produced are generally less accurate than teachers salaries; and of similar accuracy to recent NCES projections of associate's degrees. (See table A2, page 97, for the mean absolute percentages of the recent forecasts of selected education statistics.) Long-term projections which are economically based, such as those for current expenditures and teacher salaries, will generally be less accurate than long-term demographic projections, such as those for elementary and secondary enrollments.

## Current Expenditures

Past Trends

Current expenditures increased from $\$ 213.4$ billion in 1985-86 to $\$ 311.6$ billion in 1998-99 using constant 1999-2000 dollars and the Consumer Price Index (table 33 and figure 53). (The 1998-99 school year is the last year for which current expenditures are available.) This was an increase of 46 percent. Current expenditures are estimated to increase to $\$ 336.3$ billion by 2001-02, an increase of 58 percent since 1985-86. From 1985-86 to 199899 , current expenditures per pupil in fall enrollment rose 24 percent to $\$ 6,696$ (table 33 and figures 54 and 55). Current expenditures per pupil in fall enrollment will increase an estimated 32 percent between 1985-86 and 2001-02. Current expenditures per pupil in average daily attendance in constant dollars (table 34) increased 23 percent from 1985-86 to 1998-99.

Historically, education expenditures have followed a path similar to general economic trends. For much of the period since 1985-86, the economy has been rising. Current expenditures have also been rising during that period. (See figure 56 for a comparison of the growth rates of current expenditures per pupil and one major indicator of the state of the economy, disposable income per capita, and appendix table B6 for the values of disposable income per capita.)

The amount that local governments spend on education is also historically associated with the amount of state education aid to local governments (appendix table B6). There was a rapid rise in state education aid to local governments during the period from 1985-86 to 1998-99. (See figure 56 for a comparison of the growth rates of current expenditures per pupil and revenue receipts from state sources per capita.)

Current expenditures, which had already been increasing, have increased each year since 1985-86. The percent increase has not been constant over that time, however. Most of the largest of the percent
increases occurred between 1985-86 and 1989-90. That was the period when disposable income per capita and state education aid per capita were also increasing most rapidly. Also during that period, enrollments, which had been falling since the early 1970s, entered a period of steady increases. Since 1989-90, current expenditures have not been increasing as rapidly. Disposable income per capita and state education aid per capita have been increasing at lower rates than in the mid-1980s as well.

The percentage of total disposable income spent on public elementary and secondary school current expenditures increased slightly from 1985-86 (4.6 percent) to 1998-99 (4.7 percent) (table 33 and appendix tables B5 and B6). Fall enrollment increased annually every year during that time period.

Current expenditures per pupil in fall enrollment as a percentage of disposable income per capita fell from 27.5 percent in 1985-86 to 27.4 percent in 1998-99 (tables 33 and appendix table B6).

## Alternative Projections

Three sets of projections are presented for current expenditures in this chapter. Each set of projections is based on alternative assumptions concerning the economy. These assumptions together with the methodology used to produce the current expenditure projections are discussed in appendix A5.

The projections in this chapter are presented in both constant 1999-2000 dollars and in current dollars. The projections were developed in constant dollars and then placed in current dollars using projections for the Consumer Price Index (CPI) (table B6). Three alternative sets of projections for the CPI were used, one for use with the middle alternative projections, one for use with the low alternative projections, and one for use with the high alternative projections.

As projections of current expenditures produced using similar methodologies have appeared in the past 12 editions of the Projections of Education Statistics, there is information on the historical accuracy of similar current expenditures projections. Historically, the average difference between the actual values and the projections of both current expenditures and current expenditures per pupil has been about 2 percent for projections that are two or three years out from the year of the last actual data. Projections for years that are further out from the last year of actual data tend to be less accurate. The average difference between the actual values and projections seven or more years out from the last
year with actual data generally has been over 4.5 percent for current expenditures and current expenditures per pupil. (See table A2, page 97, for the mean absolute percentages of the recent forecasts of current expenditures and appendix A5 for a further discussion of the accuracy of these forecasts.)

In the middle alternative projections, current expenditures in constant 1999-2000 dollars are projected to increase steadily throughout the forecast period, reaching $\$ 418$ billion in 2010-11. This is an increase of 34 percent over the 1998-99 level, and 24 percent over the estimated level for 2001-02. Current expenditures are projected to increase most rapidly during the first half of the period. This is also the period during which enrollments are expected to increase most rapidly.

Current expenditures per pupil in fall enrollment in constant dollars are projected to increase by 33 percent from $\$ 6,696$ in 1998-99 to $\$ 8,875$ in 201011 (table 33 and figure 54).

In the middle economic growth projection, total current expenditures as a percentage of total disposable income are projected to decrease to 4.2 percent in 2010-11 (table 33 and appendix tables B5 and B6). Current expenditures per pupil in fall enrollment as a percentage of disposable income per capita are projected to decrease slightly, from 27.4 percent to 26.7 percent during the same period.

In the low economic growth projections, both current expenditures and current expenditures per pupil are projected to increase more slowly than in the middle set of projections. Current expenditures are projected to increase by 29 percent from 199899 to 2010-11, reaching $\$ 402.4$ billion at the end of the forecast period.

In the high economic growth projections, current expenditures are projected to increase by approximately 40 percent over the 1998-99 level to $\$ 435.9$ billion in 2010-11.

## Teacher Salaries

## Past Trends

The period from 1985-86 to 2000-01 has been dominated by two different patterns for teacher salaries in constant dollars (table 35 and figures 57 and 58).

Teacher salaries had reached the bottom of a period of steady declines in 1980-81, and then entered a period of steady and relatively rapid growth. From 1985-86 to 1989-90, teacher salaries increased 7 percent, from $\$ 39,204$ to $\$ 41,824$ in constant 1999-2000 dollars. During this period, current expenditures and the revenues of state
governments were increasing rapidly. (See figure 59 for a comparison of the growth rates for teacher salaries and current expenditures per pupil.)

From 1989-90 to 2000-01, teacher salaries decreased less than one percent. During much of that period, the economy, current expenditures, and revenues of state and local governments had not been increasing as rapidly as they did at the end of the end of the 1990s.

## Alternative Projections

As with current expenditures, three sets of projections are presented for teacher salaries. The methodology and the assumptions used to produce these projections are discussed in appendix A5.

As projections of teacher salaries produced using similar methodologies have appeared in the past 12 editions of the Projections of Education Statistics, there is information on the historical accuracy of similar teacher salary projections.

Historically, the average difference between the actual values and the projections of teacher salaries has been about 2 percent for projections that are two or three years out from the year of the last actual data. Projections for years that are further out from the last year of actual data tend to be less accurate. The average difference between the actual value and the projection ten years out from the last year with actual data is almost 16 percent. (See table A2, page 97, for the mean absolute percentages of the recent forecasts of teacher salaries and appendix A5 for a further discussion of the accuracy of these forecasts.)

In the middle economic growth projections, the average teacher salary in constant 1999-2000 dollars is projected to reach $\$ 43,216$ in 2010-11 (table 35 and figure 57). This is a 4 percent increase from the level estimated for 2000-01. This percent increase is less than the average percentage difference between recent long-term projections of teacher salaries and their actual values.

## Technical Appendixes

## Appendix A

# Projection Methodology 

The general procedure for Projections was to express the variable to be projected as a percent of a "base" variable. These percents were then projected and applied to projections of the "base" variable. For example, the number of 18 -year-old college students was expressed as a percent of the 18 -year-old population for each year from 1972 through 1999. This enrollment rate was then projected through the year 2011 and applied to projections of the 18 -year-old population from the Bureau of the Census.

Enrollment projections are based primarily on population projections. Projections of elementary and secondary teachers, high school graduates, earned degrees conferred, and expenditures are based primarily on enrollment projections.

Exponential smoothing and multiple linear regression are the two major projection techniques used in this publication. Single exponential smoothing is used when the historical data have a basically horizontal pattern. On the other hand, double exponential smoothing is used when the time series is expected to change linearly with time. In general, exponential smoothing places more weight on recent observations than on earlier ones. The weights for observations decrease exponentially as one moves further into the past. As a result, the older data have less influence on these projections. The rate at which the weights of older observations decrease is determined by the smoothing constant selected.
$P=\alpha X_{t}+\alpha(1-\alpha) X_{t-1}+\alpha(1-\alpha)^{2} X_{t-2}$
$+\alpha(1-\alpha)^{3} X_{t-3}+\ldots \ldots .$.

## Where:

P = projected value
$\alpha=$ smoothing constant $(0<\alpha<1)$
$\mathrm{X}_{\mathrm{t}}=$ observation for time t
This equation illustrates that the projection is a weighted average based on exponentially decreasing weights. For a high smoothing constant, weights for
earlier observations decrease rapidly. For a low smoothing constant, decreases are more moderate. Projections of enrollments and public high school graduates are based on a smoothing constant of $\alpha=$ 0.4 .

The farther apart the observations are spaced in time, the more likely it is that there are changes in the underlying social, political, and economic structure. Since the observations are on an annual basis, major shifts in the underlying process are more likely in the time span of just a few observations than if the observations were available on a monthly or weekly basis. As a result, the underlying process tends to be unstable from one observation to the next. Another reason for using high smoothing constants for some time series is that most of the observations are fairly accurate, because most observations are population values rather than sample estimates. Therefore, large shifts tend to indicate actual changes in the process rather than noise in the data.

Multiple linear regression is also used in making projections, primarily in the areas of elementary and secondary teachers, earned degrees conferred, and expenditures. This technique is used when it is believed that a strong relationship exists between the variable being projected (the dependent variable) and independent variables. However, this technique is used only when accurate data and reliable projections of the independent variables are available.

The functional form primarily used is the multiplicative model. When used with two independent variables, this model takes the form:

$$
\mathrm{Y}=\mathrm{a} \mathrm{X}_{1}^{\mathrm{b}_{1}} \mathrm{X}_{2}^{\mathrm{b}_{2}}
$$

This equation can easily be transformed into the linear form by taking the natural $\log (\ln )$ of both sides of the equation:

$$
\ln \mathrm{Y}=\ln (\mathrm{a})+\mathrm{b}_{1} \ln \mathrm{X}_{1}+\mathrm{b}_{2} \ln \mathrm{X}_{2}
$$

The multiplicative model has a number of advantages. Research has found that it is a reasonable
way to represent human behavior. Constant elasticities are assumed, which means that a 1 percent change in $\ln X$ will lead to a given percent change in $\ln Y$. This percent change is equal to $b_{1}$. And the multiplicative model lends itself easily to "a priori" analysis because the researcher does not have to worry about units of measurement when specifying relationships. In fact, the multiplicative model is considered the standard in economic analyses. For additional information, see Long-Range Forecasting: From Crystal Ball to Computer by J. Scott Armstrong (John Wiley and Sons, 1978, pp. 180-181).

## Caveats

Because projections are subject to errors from many sources, alternative projections are shown for some statistical series. These alternatives are not statistical confidence intervals, but instead represent outcomes based on alternative growth patterns. Alternative projections were developed for college enrollment, earned degrees conferred, elementary and secondary teachers, and expenditures in public elementary and secondary schools.

## Assumptions

All projections are based on underlying assumptions, and these assumptions determine projection results to a large extent. It is important that users of projections understand the assumptions to determine the acceptability of projected time series for their purposes. Descriptions of the primary assumptions upon which the projections of time series are based are presented in table A1, page 96.

For most projections, low, middle, and high alternatives are shown. These alternatives reveal the level of uncertainty involved in making projections, and they also point out the sensitivity of projections to the assumptions on which they are based.

Many of the projections in this publication are demographically based on Bureau of the Census middle series projections of the population by age, but are not adjusted for the 1990 net undercount of 4 to 5 million. The population projections developed by the Bureau of the Census reflect the incorporation of the 1999 estimates and middle series assumptions for the fertility rate, net immigration, and a declining mortality rate.

These middle series population projections are based on the estimated population as of January 1, 1999 and the estimated base population as of April 1, 1990. The future fertility rate assumption, which determines projections of the number of births, is one
key assumption in making population projections.
The middle series population projections assume an ultimate complete cohort fertility rate of 2.13 births per woman by the year 2011. Yearly net migration is assumed to increase from 970,368 in 2000 to 980,425 in 2001 and then decrease to 724,192 by 2011. This assumption plays a major role in determining population projections for the age groups enrolled in nursery school, kindergarten, and elementary grades. The effects of the fertility rate assumption are more pronounced toward the end of the projection period, while the immigration assumptions affect all years.

For enrollments in secondary grades and college, the fertility assumption is of no consequence, since all students enrolled at these levels were already born when the population projections were made. For projections of enrollments in elementary schools, only middle series population projections were considered. Projections of high school graduates are based on projections of the percent of grade 12 enrollment that are high school graduates. Projections of associate's, bachelor's, master's, doctor's, and first-professional degrees are based on projections of college-age populations and college enrollment, by sex, attendance status and level enrolled by student, and by type of institution. Projections of college enrollment are also based on disposable income per capita and unemployment rates. The projections of elementary and secondary teachers are based on education revenue receipts from state sources and enrollments. The projections of expenditures of public elementary and secondary schools are based on enrollments and projections of disposable income per capita and various revenue measures of state and local governments. Projections of disposable income per capita and unemployment rates were obtained from the company, DRI•WEFA, Inc. Therefore, many additional assumptions made in projecting disposable income per capita and unemployment rates apply to projections based on projections of these variables.

## Limitations of Projections

Projections of time series usually differ from the final reported data due to errors from many sources. This is because of the inherent nature of the statistical universe from which the basic data are obtained and the properties of projection methodologies, which depend on the validity of many assumptions. Therefore, alternative projections are shown for most statistical series to denote the uncertainty involved in making projections. These alternatives are not statistical confidence limits, but instead represent judgments made by the authors as to reasonable upper and lower
bounds. The mean absolute percentage error is one way to express the forecast accuracy of past projections. This measure expresses the average value of the absolute value of errors in percentage terms. For example, the mean absolute percentage errors of public school enrollment in grades K-12 for lead times of $1,2,5$, and 10 years were $0.2,0.5,1.2$,
and 2.9 percent, respectively. On the other hand, mean absolute percentage errors for doctor's degrees for lead times of 1,2 , and 5 years were $2.0,2.8$, and 3.7 percent respectively. For more information on mean absolute percentage errors, see table A2, page 97.

## A1. Enrollment

#### Abstract

National Enrollment projections were based on projected enrollment rates, by age and sex, which were applied to population projections by age and sex developed by the Bureau of the Census. These enrollment rates were projected by taking into account the most recent trends, as well as the effects of economic conditions and demographic changes on a person's decision to enter college. The enrollment rates were then used in the Education Forecasting Model (EDMOD), which consists of age-specific rates by sex and by enrollment levels.

## Education Forecasting Model

The first stage of EDMOD is an age-specific enrollment model in which enrollment rates are projected and applied to age-specific population projections. This stage, which is used separately for each sex, includes the following categories: (1) full-time college enrollment, and (2) part-time college enrollment. Within an enrollment category, where applicable, enrollment rates were projected by individual ages 16 through 24 and for the age groups 25 to 29,30 to 34 , and 35 years and over.

Enrollments by age and age groups from the Bureau of the Census were adjusted to NCES totals to compute enrollment rates for 1972 through 1999. Different assumptions were made to produce low, middle, and high alternative projections of enrollment rates to the year 2011.

## College Full-Time and Part-Time Enrollment

Projections of full-time and part-time college enrollments were considered only for ages 16 and over. College enrollment is negligible for earlier ages. Three alternative projections were made using various economic assumptions. Table A1.1 shows enrollment rates for 1999 and middle alternative projected enrollment rates for 2006 and 2011. Table A1.2 shows the equations used to project enrollment rates for men by attendance status. Table A1.3 shows the equations used to project enrollment rates for women by attendance status.

## Enrollment in Public Elementary and Secondary Schools, by Grade Group and Organizational Level

The second stage of EDMOD projects public enrollment in elementary and secondary schools by grade group and by organizational level. Public enrollments by age were based on enrollment rate projections for nursery and kindergarten, grade 1 , elementary ungraded and special, secondary ungraded and special, and postgraduate enrollment. Grade progression rate projections were used for grades 2 through 12. Table A1.4 shows the public school enrollment rates and table A1.5 shows the public school grade progression rates for 1999 and projections for 2006 and 2011. The projected rates in tables A1.4 and A1.5 were used to compute the projections of enrollments in elementary and secondary schools, by grade, shown in table 1 .

## College Enrollment, by Sex, Attendance Status, and Level Enrolled; and by Type and Control of Institution

The third stage of EDMOD projects enrollments in institutions of higher education, by sex, attendance status, and level enrolled by student and by type and control of institution. For each age group, the percent of total enrollment by age, attendance status, level enrolled, and type of institution was projected. These projections for 2006 and 2011 are shown in tables A1.6 and A1.7, along with actual values for 1999. For all projections, it was assumed that there was no enrollment in 2-year institutions at the postbaccalaureate level (graduate and first-professional).

The projected rates in tables A1.6 and A1.7 were then adjusted to agree with the projected age-specific enrollment rates in the first stage of EDMOD. The adjusted rates were then applied to the projected enrollments by age group, sex, and attendance status from the first stage of EDMOD to obtain projections by age group, sex, attendance status, level enrolled, and type of institution.

For each enrollment category-sex, attendance status, level enrolled, and type of institution-public enrollment was projected as a percent of total enrollment. Projections for 2006 and 2011 are shown in table A1.8, along with actual percents for 1999. The projected rates were then applied to the projected enrollments in each enrollment category to obtain
projections by control of institution.
For each category by sex, enrollment level, and type and control of institution, graduate enrollment was projected as a percent of postbaccalaureate enrollment. Actual rates for 1999 and projections for 2006 and 2011 are shown in table A1.9. The projected rates in table A1.9 were then applied to projections of postbaccalaureate enrollment to obtain graduate and first-professional enrollment projections by sex, attendance status, and type and control of institution.

## Full-Time-Equivalent Enrollment, by Type and Control of Institution and by Level Enrolled

The fourth stage of EDMOD projects full-time-equivalent enrollment, by type and control of institution and by level enrolled. For each enrollment category by level enrolled and by type and control of institution, the full-time-equivalent of part-time enrollment was projected as a percent of part-time enrollment. Actual percents for 1999 and projections for 2006 and 2011 are shown in table A1.10.

These projected percents were applied to projections of enrollment by level enrolled and by type and control of institution from the third stage of EDMOD. The projections were added to projections of full-time enrollment (from the previous stage) to obtain projections of full-time-equivalent enrollment.

## Projection Accuracy

An analysis of projection errors from the past 18 editions of Projections of Education Statistics indicates that the mean absolute percentage errors (MAPEs) for lead times of $1,2,5$, and 10 years out for projections of public school enrollment in grades $\mathrm{K}-12$ were $0.2,0.5$, 1.2 , and 2.9 percent, respectively. For the 1 -year-out prediction, this means that one would expect the projection to be within 0.2 percent of the actual value, on the average. For projections of public school enrollment in grades K-8, the MAPEs for lead times of $1,2,5$, and 10 years were $0.3,0.5,1.2$, and 4.3 percent, respectively, while those for projections of public school enrollment in grades $9-12$ were $0.4,0.7,1.3$, and 2.6 percent for the same lead times.

For projections of total enrollment in degreegranting institutions, an analysis of projection errors based on the past 6 editions of Projections of Education Statistics indicates that the MAPEs for lead times of 1,2 , and 5 years were $1.0,0,9$, and 2.2 percent, respectively. For the 1 -year-out prediction, this means that one would expect the projection to be within 1.0 percent of the actual value, on the average.

For more information on mean absolute percentage errors, see table A2, page 97.

## Basic Methodology

The notation and equations that follow describe the basic models used to project public elementary and secondary enrollment.

## Public Elementary and Secondary Enrollment

## Let:

i $\quad=$ Subscript denoting age
j = Subscript denoting grade
t = Subscript denoting time
$\mathrm{K}_{\mathrm{t}} \quad=$ Enrollment at the nursery and kindergarten level
$\mathrm{G}_{\mathrm{jt}} \quad=$ Enrollment in grade j
$\mathrm{G}_{\mathrm{lt}} \quad=$ Enrollment in grade 1
$\mathrm{E}_{\mathrm{t}} \quad=$ Enrollment in elementary special and ungraded programs
$\mathrm{S}_{\mathrm{t}} \quad=$ Enrollment in secondary special and ungraded programs
$\mathrm{PG}_{\mathrm{t}} \quad=$ Enrollment in postgraduate programs
$\mathrm{P}_{\mathrm{it}} \quad=$ Population age i
$\mathrm{RK}_{\mathrm{t}} \quad=$ Enrollment rate for nursery and kindergarten
$\mathrm{RG}_{\mathrm{lt}} \quad=$ Enrollment rate for grade 1
$\mathrm{RE}_{\mathrm{t}} \quad=$ Enrollment rate for elementary special and ungraded programs
$\mathrm{RS}_{\mathrm{t}} \quad=$ Enrollment rate for secondary special and ungraded programs
$\mathrm{RPG}_{\mathrm{t}}=$ Enrollment rate for postgraduate programs
$\mathrm{EG}_{\mathrm{t}} \quad=$ Total enrollment in elementary grades (K-8)
$\mathrm{SG}_{\mathrm{t}} \quad=$ Total enrollment in secondary grades (9-12)
$\mathrm{R}_{\mathrm{jt}} \quad=$ Progression rate for grade j : the proportion that enrollment in grade $j$ in year $t$ is of enrollment in grade $\mathrm{j}-1$ in year $\mathrm{t}-1$.

## Then:

$$
\begin{aligned}
& \mathrm{EG}_{\mathrm{t}}=\mathrm{K}_{\mathrm{t}}+\mathrm{E}_{\mathrm{t}}+\sum_{\mathrm{j}=1}^{8} \mathrm{G}_{\mathrm{jt}} \\
& \mathrm{SG}_{\mathrm{t}}=\mathrm{S}_{\mathrm{t}}+\mathrm{PG}_{\mathrm{t}}+\sum_{\mathrm{J}=9}^{12} \mathrm{G}_{\mathrm{gt}}
\end{aligned}
$$

## Where:

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{t}}=\mathrm{RK} \mathrm{~K}_{\mathrm{t}}\left(\mathrm{P}_{5 \mathrm{t}}\right) \\
& \mathrm{G}_{\mathrm{jt}}=\mathrm{R}_{\mathrm{jt}}\left(\mathrm{G}_{\mathrm{j}-1, \mathrm{t}-1}\right)
\end{aligned}
$$

$$
E_{t}=\operatorname{RE}_{t}\left(\sum_{\mathrm{J}=\mathrm{S}}^{13} \mathrm{P}_{\mathrm{it}}\right)
$$

$$
\mathrm{G}_{1 \mathrm{t}}=\mathrm{RG}_{\mathrm{it}}\left(\mathrm{P}_{6 \mathrm{t}}\right)
$$

$$
\mathrm{S}_{\mathrm{t}}=\mathrm{RS}_{\mathrm{t}}\left(\sum_{\mathrm{i}=14}^{17} \mathrm{P}_{\mathrm{it}}\right)
$$

$$
\mathrm{PG}_{t}=\mathrm{RPG}_{t}\left(\mathrm{P}_{18 t}\right)
$$

## Higher Education Enrollment

For institutions of higher education, projections were computed separately by sex and attendance status of student. The notation and equations are:

## Let:

i $\quad=$ Subscript denoting age except:
$\mathrm{i}=25$ : ages $25-29$
$i=26$ : ages $30-34$
i = 27: ages 35 and over for enrollment (35-44 for population)
t = Subscript denoting year
$\mathrm{E}_{\mathrm{it}} \quad=$ Enrollment of students age i
$\mathrm{P}_{\mathrm{it}} \quad=$ Population age i
$\mathrm{R}_{\mathrm{it}} \quad=$ Enrollment rate for students age i
$\mathrm{T}_{\mathrm{it}} \quad=$ Total enrollment for particular subset of students: full-time men, full-time women, part-time men, part-time women

## Then:

$\mathrm{T}_{\mathrm{it}}=\sum_{\mathrm{i}=\mathrm{F} \mathrm{b}}^{27} \mathrm{E}_{\mathrm{it}}$

## Where:

$\mathrm{E}_{\mathrm{it}}=\mathrm{R}_{\mathrm{it}}\left(\mathrm{P}_{\mathrm{it}}\right)$

## Methodological Tables

Tables A1.11 and A1.12 give the rates used to calculate projections of enrollments and basic assumptions underlying enrollment projections.

## Private School Enrollment

This edition is the first report that contains projected trends in elementary and secondary enrollment by grade level in private schools produced using the grade progression rate method.

Private school enrollment data from the National Center for Education Statistics' Private School Universe Survey for 1989-90, 1991-92, 1993-94, 1995-96, 1997-98, and 1999-2000 were used to develop these projections. In addition, population estimates for 1989 to 1999 and population projections for 2000 to 2011 from the U.S. Department of Commerce, Bureau of the Census were used to develop the projections.

The grade progression rate method was used to project private elementary and secondary school enrollment. The grade progression rate method starts with 6 -year-olds entering first grade and then follows
their progress through private elementary and secondary schools. The method requires calculating the ratio of the number of children in one year who "survive" the year and enroll in the next grade the following year.

Projections of enrollment in private elementary and secondary schools were developed using primarily the grade progression rate method. Kindergarten and first grade enrollments are based on projected enrollment rates of 5 - and 6 -year-olds. These projected enrollment rates are applied to population projections of 5- and 6 -year-olds developed by the Bureau of the Census.

Enrollments in grades 2 through 12 are based on projected grade progression rates. These projected rates are then applied to the current enrollment by grade to yield grade-by-grade projections for future years. Enrollment rates of 5-and 6-year-olds and grade progression rates are projected using single exponential smoothing. Elementary ungraded and special enrollments and secondary ungraded and special enrollments are projected to remain constant at their 1999 levels. To obtain projections of total enrollment, projections of enrollments for the individual grades (kindergarten through 12) and ungraded and special classes were summed.

The grade progression rate method assumes that past trends in factors affecting private school enrollments will continue over the projection period. This assumption implies that all factors influencing enrollments will display future patterns consistent with past patterns. This method implicitly includes the net effect of such factors as migration, dropouts, deaths, nonpromotion, and transfers to and from public schools.

Mean absolute percentage errors (MAPEs) of the projection accuracy of private school enrollment were not developed because these projections were prepared for the first time using a new data source and methodology. As additional data becomes available MAPEs can then be calculated.

## State-Level

This edition contains projected trends in elementary and secondary enrollment by grade level in public schools from 2000 to the year 2011. This is the seventh report on state-level projections for public school elementary and secondary education statistics.

Public school enrollment data from the National Center for Education Statistics' Common Core of Data survey for 1970 to 1999 were used to develop these projections. This survey does not collect data on
enrollment for private schools. In addition, population estimates for 1970 to 1999 and population projections for 2000 to 2011 from the U.S. Department of Commerce, Bureau of the Census were used to develop the projections.

Table A1.11 describes the number of years, projection methods, and smoothing constants used to project enrollments in public schools. Also included in table A1.11 is the procedure for choosing the different smoothing constants for the time series models.

Projections of enrollment in public elementary and secondary schools by state were developed using primarily the grade progression rate method. Kindergarten and first grade enrollments are based on projected enrollment rates of 5-and 6-year-olds. These projected enrollment rates are applied to population projections of 5 - and 6 -year-olds developed by the Bureau of the Census.

Enrollments in grades 2 through 12 are based on projected grade progression rates in each state. These projected rates are then applied to the current enrollment by grade to yield grade-by-grade projections for future years. Enrollment rates of 5-and 6 -year-olds and grade progression rates are projected using single exponential smoothing. Elementary ungraded and special enrollments and secondary ungraded and special enrollments are projected to remain constant at their 1998 levels. To obtain projections of total enrollment, projections of enrollments for the individual grades (kindergarten through 12) and ungraded and special classes were summed.

The grade progression rate method assumes that past trends in factors affecting public school enrollments will continue over the projection period. This assumption implies that all factors influencing enrollments will display future patterns consistent with past patterns. Therefore, this method has limitations when applied to states with unusual changes in migration rates. This method implicitly includes the net effect of such factors as migration, dropouts, deaths, nonpromotion, and transfers to and from private schools.

## Adjustment to National Projections

The sum of the projections of state enrollments was adjusted to equal the national projections of public school K-12, K-8, and 9-12 enrollments shown in table 1. For details on the methods used to develop the national projections for this statistic, see the section on national enrollment projections in this appendix.

Table A1.1.-College enrollment rates, by age, sex, and attendance status, with middle alternative projections: Fall 1999, 2006, and 2011

| Age, sex, and attendance status |  |  | Proj |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1999 | 2006 | 2011 |

and State Public High School Graduates Model. (This table was prepared June 2001.)

Table A1.12.-Enrollment (assumptions)

| Variables | Assumptions | Alternatives | Tables |
| :---: | :---: | :---: | :---: |
| Elementary and Secondary enrollment | Age-specific enrollment rates will remain constant at levels consistent with the most recent rates. | Middle (no alternatives) | 1,2 |
|  | Public enrollment rates and public grade retention rates will remain constant at levels consistent with the most recent rates. | Middle (no alternatives) | 1, 2 |
|  | The percentage of 7th and 8th grade public students enrolled in school organized as secondary schools will remain constant at levels consistent with the most recent rates. | Middle (no alternatives) | 1,2 |
| College enrollment, by age |  |  |  |
| Full-time | Age-specific enrollment rates by sex are a function of dummy variables by age, middle alternative log of four-period weighted average of real disposable income per capita, and middle alternative $\log$ unemployment rate by age group. | Middle | $\begin{gathered} 10 \\ 14-19 \end{gathered}$ |
| Part-time | Age-specific enrollment rates by sex are a function of dummy variables by age and the middle alternative log of four-period weighted average of real disposable income per capita. | Middle | $\begin{gathered} 10 \\ 14-19 \end{gathered}$ |
| College enrollment, by sex, attendance status, level enrolled, and type of institution | For each group and for each attendance status separately, percent of total enrollment by sex, level enrolled, and type of institution will follow past trends through 2011. For each age group and attendance status category, the sum of the percentages must equal 100 percent. | High, middle, and low | $\begin{gathered} 10 \\ 14-19 \end{gathered}$ |
| College enrollment, by control of institution | For each enrollment category, by sex, attendance status, and level enrolled, and by type of institution, public enrollment as a percent of total enrollment will remain constant at levels consistent with the most recent rates. | High, middle, and low | $\begin{gathered} 10 \\ 14-19 \end{gathered}$ |
| Graduate enrollment | For each enrollment category, by sex and attendance status of student, and by type and control of institution, graduate enrollment as a percent of postbaccalaureate enrollment will remain constant at levels consistent with the most recent rates. | High, middle, and low | 20 |
| Full-time-equivalent of part-time enrollment | For each enrollment category, by type and control of institution and level enrolled, the percent that full-time-equivalent of part-time enrollment is of part-time enrollment will remain constant at levels consistent with the most recent rates. | High, middle, and low | 22 |

and Enrollment in Degree-Granting Institutions Model. (This table was prepared June 2001.)

## A2. High School Graduates

National

Projections of public high school graduates were developed in the following manner. The number of public high school graduates was expressed as a percent of grade 12 enrollment in public schools for 1972 to 1999. This percent was projected using single exponential smoothing and applied to projections of grade 12 enrollment to yield projections of high school graduates in public schools. (This percent does not make any specific assumptions regarding the dropout rate. The effect of the 12 th grade dropout proportion is reflected implicitly in the graduate proportion.) The grade 12 enrollment was projected based on grade progression rates. This percent was assumed to remain constant at levels consistent with the most recent rates. This method assumes that past trends in factors affecting graduation ratios, such as dropouts, migration, and public/private transfers will continue over the projection period. In addition to student behaviors, the projected number of graduates could be impacted by changes in policies affecting graduation requirements.

The number of private high school graduates was expressed as a percent of grade 12 enrollment in private schools for 1989 to 1999. This percent was projected using single exponential smoothing and applied to projections of grade 12 enrollment to yield projections of high school graduates in private schools. (This percent does not make any specific assumptions regarding the dropout rate. The effect of the 12th grade dropout proportion is reflected implicitly in the graduate proportion.) The grade 12 enrollment was projected based on grade progression rates. This percent was assumed to remain constant at levels consistent with the most recent rates. This method assumes that past trends in factors affecting graduation ratios, such as dropouts, migration, and public/private transfers will continue over the projection period. In addition to student behaviors, the projected number of graduates could be impacted by changes in policies affecting graduation requirements.

## Projection Accuracy

An analysis of projections from models used in the past 18 editions of Projections of Education Statistics indicates that the mean absolute percentage errors (MAPEs) for projections of public high school graduates were 0.7 percent for 1 year ahead, 0.9 percent for 2 years ahead, 1.7 percent for 5 years ahead, and 4.1 percent for 10 years ahead. For the 1 -year-ahead prediction, this means that one would expect the projection to be within 0.7 percent of the actual value, on the average. For more information on the mean absolute percentage errors, see table A2, page 97.

## State-Level

This edition contains projections of high school graduates from public schools by state from 1999-2000 to 2010-11. Public school graduate data from the National Center for Education Statistics' Common Core of Data survey for 1969-70 to 1998-99 were used to develop these projections. This survey does not collect graduate data for private schools.

Projections of public high school graduates by state were developed in the following manner. For each state, the number of public high school graduates was expressed as a percent of grade 12 enrollment in public schools for 1970 to 1999. This percent was projected using single exponential smoothing and applied to projections of grade 12 enrollment to yield projections of high school graduates in public schools. Projections of grade 12 enrollment were developed based on the grade progression rates discussed in section A1, Enrollment. This percent was assumed to remain constant at levels consistent with the most recent rates. This method assumes that past trends in factors affecting public high school graduates will continue over the projection period.

## A3. Earned Degrees Conferred

Projections of associate's, bachelor's, master's, doctor's, and first-professional degrees by sex were based on demographic models that relate degree awards to college-age populations and college enrollment by level enrolled and attendance status.

## Associate's Degrees

Associate's degree projections by sex were based on undergraduate enrollment by attendance status in 2 -year institutions. Results of the regression analysis used to project associate degrees by sex are shown in table A3.1.

## Bachelor's Degrees

Bachelor's degree projections by sex were based on the 18 - to 24 -year-old population and undergraduate enrollment by attendance status in 4 -year institutions. Results of the regression analysis used to project bachelor's degrees by sex are shown in table A3.1.

## Master's Degrees

Master's degree projections by sex were based on full-time graduate enrollment by sex. Results of the regression analysis used to project master's degrees by sex are shown in table A3.1.

## Doctor's Degrees

Doctor's degree projections for men were based on full-time male graduate enrollment and the unemployment rate. Doctor's degree projections for women were based on the 35- to 44 -year-old population of women and full-time female graduate
enrollment. The results of the regression analysis used to project doctor's degrees by sex are shown in table A3.1.

## First-Professional Degrees

First-professional degree projections by sex were based on first-professional enrollment by attendance status in 4-year institutions. Results of the regression analysis used to project first-professional degrees by sex are shown in table A3.1.

## Methodological Tables

These tables describe equations used to calculate projections (table A3.1), and basic assumptions underlying projections (table A3.2).

## Projection Accuracy

An analysis of projection errors from similar models used in the past 6 editions of Projections of Education Statistics indicates that mean absolute percentage errors (MAPEs) for associate"s degrees were 1.5 percent for 1 year out, 3.4 percent for 2 years out, and 6.4 percent for 5 years out. For the 1 -year-out prediction, this means that one would expect the projection to within 1.5 percent of the actual value, on the average. MAPEs for bachelor's degree projections were 1.0 percent for 1 year out, 1.8 percent for 2 years out, and 1.0 percent for 5 years out. MAPEs for master's degrees were $1.0,3.8$, and 2.1 , respectively. For doctor's degrees, the MAPEs were $2.0,2.8$, and 3.7 percent, respectively. For first-professional degrees, the MAPEs were $1.6,1.5$, and 3.8 percent, respectively. For more information on the mean absolute percentage errors, see table A2, page 97.

${ }^{1}$ For an explanation of the Durbin-Watson statistic, see J. Johnston, Econometric Methods, New York: McGraw-Hill, 1972, pages 251-252.
${ }^{2}$ AR1 indicates an estimation procedure for correcting the problem of first-order autocorrelation. OLS indicates Ordinary Least Squares. For a general discussion of the problem of autocorrelation, and the method used to forecast in the presence of autocorrelation, see G. Judge, W. Hill, R. Griffiths, H. Lutkepohl, and T. Lee,The Theory and Practice of Econometrics, New York: John Wiley and Sons, 1985, pages 315-318.
Where:
ASSOCM $\quad=$ Number of associate's degrees awarded to men
ASSOCW = Number of associate's degrees awarded to women
BACHM = Number of bachelor's degress awarded to men
BACHW $\quad=$ Number of bachelor's degress awarded to women
MASTM = Number of master's degrees awarded to men
MASTW $\quad=$ Number of master's degrees awarded to women
DOCM $\quad$ Number of doctor's degress awarded to men
DOCW $\quad=$ Number of doctor's degress awarded to women
FPROM = Number of first-professional degrees awarded to men
FPROW $=$ Number of first-professional degrees awarded to women
UGFT2M $\quad$ Full-time male undergraduate enrollment in 2-year institutions, lagged 2 years, in thousand
UGPT2M = Part-time male undergraduate enrollment in 2-year institutions, lagged 2 years, in thousands
UGFT2W =Full-time female undergraduate enrollment in 2-year institutions, lagged 2 years, in thousands
P1824M = Population of 18- to 24-year-old men, in thousands
P1824W = Population of 18- to 24-year-old women, in thousands
UGFT4M $=$ Full-time male undergraduate enrollment in 4 -year institutions, lagged 2 years, in thousands
UGFT4W $\quad=$ Full-time female undergraduate enrollment in 4-year institutions, lagged 3 years, in thousands
GFTM $=$ Full-time male graduate enrollment, in thousands
GFTW = Full-time female graduate enrollment, in thousands
P3544W = Population of 35- to 44-year-old women, in thousands
GFTM1 = Full-time male graduate enrollment lagged one year, in thousands
GFTW = Full-time female graduate enrollment, in thousands
RUC = Unemployment rate
FPFTM $\quad=$ Full-time male first-professional enrollment lagged 2 years, in thousands
FPFTW $\quad=$ Full-time female first-professional enrollment lagged 1 year, in thousands
FPPTW = Part-time female first-professional enrollment lagged 2 years, in thousands
NOTE: $R^{2}$ indicates the coefficient of determination. Numbers in parentheses are $t$-statistics.

| Women | The number of first-professional degrees awarded to women is a linear function of full-time female first-professional enrollment lagged 1 year and part-time female first-professional enrollment lagged 2 years. This relationship will continue through 2010-11. | Middle | 30 |

# A4. Elementary and Secondary Teachers 

## Public Elementary and Secondary Teachers

The number of public elementary and secondary teachers was projected separately for the elementary and secondary levels. The elementary teachers were modeled as a function of local education revenue receipts from state sources per capita and elementary enrollment. Secondary teachers were modeled as a function of local education revenue receipts from state sources per capita (lagged 3 years) and secondary enrollment. Local education revenue receipts from state sources were in constant 1982-84 dollars.

The equations in this section should be viewed as forecasting rather than structural equations, as the limitations of time and available data precluded the building of a large-scale, structural teacher model. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination $\left(\mathrm{R}_{2} \mathrm{~s}\right)$, the t -statistics of the coefficients, the Durbin-Watson statistic, and residual plots.

The multiple regression technique will yield good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

The public elementary teacher model is:

## ELTCH $=\mathrm{b}_{0}+\mathrm{b}_{1}$ SGRANT $+\mathrm{b}_{2}$ ELENR

where:
ELTCH is the number of public elementary teachers.

SGRANT is the level of education revenue receipts from state sources per capita in constant 1982-84 dollars; and

ELENR is the number of students enrolled in public elementary schools.

Each variable affects the number of teachers in the expected way. As the state spends more money on education and as enrollment increases, the number of elementary teachers hired increases.

The public secondary teacher model is:

$$
\text { SCTCH }=\mathrm{b}_{0}+\mathrm{b}_{1} \text { SGRANT3 }+\mathrm{b}_{2} \text { SCENR }
$$

where:

SCTCH is the number of public secondary teachers;

SGRANT3 is the level of education revenue receipts from state sources per capita in constant 1982-84 dollars, lagged 3 years; and

SCENR is the number of students enrolled in public secondary schools.

Each variable affects the number of teachers in the expected way. As the state spends more money on education and as enrollment increases, the number of secondary teachers hired increases.

Table A4.1 summarizes the results for the elementary and secondary public teacher models.

Enrollment is by organizational level, not by grade level. Thus, secondary enrollment is not the same as grade 9-12 enrollment because some states count some grade 7 and 8 enrollment as secondary. Therefore, the distribution of the number of teachers is also by organizational level, not by grade span.

## Private Elementary and Secondary Teachers

Projections of private elementary and secondary teachers were derived in the following manner. For 1960 to 1998 , the ratio of private school teachers to public school teachers was calculated by organizational level. These ratios were projected using single exponential smoothing, yielding a constant value over the projection period. This constant value was then applied to projections of public school teachers by organizational level to yield projections of private school teachers. This method assumes that the future pattern in the trend of private school teachers will be the same as that for public school teachers. The reader is cautioned that a number of factors could alter the assumption of constant ratios over the projection period.

The total number of public school teachers, enrollment by organizational level, and education revenue receipts from state sources used in these projections were from the Common Core of Data (CCD) survey conducted by NCES. The proportion of public school teachers by organizational level was taken from the National Education Association and then applied to the total number of teachers from CCD to produce the number of teachers by organizational
level.

## Projection Accuracy

An analysis of projection errors from the past 12 editions of Projections of Education Statistics indicated that the mean absolute percentage errors (MAPEs) for projections of classroom teachers in
public elementary and secondary schools were 1.9 percent for 1 year out, 1.3 percent for 2 years out, 1.9 percent for 5 years out, and 4.6 percent for 10 years out. For the 2 -year-ahead prediction, this means that one would expect the projection to be within 1.3 percent of the actual value, on the average. For more information on the mean absolute percentage errors, see table A2, page 97 .

[^4]
# A5. Expenditures of Public Elementary and Secondary Schools 

Econometric techniques were used to produce the projections for current expenditures and average teacher salaries. The equations in this chapter should be viewed as forecasting equations rather than structural equations. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination $\left(\mathrm{R}^{2} \mathrm{~s}\right)$, the t -statistics of the variables, the DurbinWatson statistic, and residual plots. These econometric models will yield good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

## Elementary and Secondary School Current Expenditure Model

There has been a large body of work, both theoretical and empirical, on the demand for local public services such as education.* The elementary and secondary school current expenditure model is based on this work.

The model that is the basis for the elementary and secondary school current expenditure model has been called the median voter model. In brief, the theory states that spending for each public good in the community (in this case, education) reflects the preferences of the "median voter" in the community. This individual is identified as the voter in the community with the median income and median property value. Hence, the amount of spending in the community reflects the price of education facing the voter with the median income, as well as his income and tastes. There are competing models in which the level of spending reflects the choices of others in the community, such as the "bureaucrats." The median voter model was chosen as the basis of the elementary and secondary school current expenditure model as it has been the one most thoroughly studied.

There have been many empirical studies of the demand for education expenditures using the median voter model. In most instances, researchers have used cross-sectional data. The elementary and secondary school current expenditure model was

[^5]built on the knowledge gained from these crosssectional studies and was adapted from them for use in a time-series study.

In a median voter model, the demand for education expenditures is typically linked to four different types of variables: 1) measures of the income of the median voter; 2) measures of intergovernmental aid for education going indirectly to the median voter; 3) measures of the price to the median voter of providing one more dollar of education expenditures per pupil; and 4) any other variables that may affect one's tastes for education. The elementary and secondary school current expenditure model contains variables reflecting the first three types of variables. The model is:

$$
\begin{aligned}
\ln (\text { CUREXP }) & =\mathrm{b}_{0}+\mathrm{b}_{1} \ln (\mathrm{PCI})+\mathrm{b}_{2} \ln (\text { SGRNT }) \\
& +\mathrm{b}_{3} \ln (\text { ENRPOP })
\end{aligned}
$$

## where:

$\ln$ indicates the natural log;
CUREXP equals current expenditures of public elementary and secondary schools per pupil in fall enrollment in constant 1982-84 dollars;

PCI equals disposable income per capita in constant 1996 dollars;

SGRNT equals local governments' education revenue receipts from state sources, per capita, in constant year 1982-84 dollars; and

ENRPOP equals the ratio of fall enrollment to the population.

The model was estimated using the AR1 model for correcting for autocorrelation. This was done because the test statistics were significantly better than those from the ordinary least squares (OLS) estimation, and the Durbin-Watson statistic was in the inconclusive region when the model was estimated using OLS. This is the eighth edition of Projections of Education Statistics in which this method of estimation, rather than OLS, was used. Ordinary least squares was used in the previous four editions of Projections of Education Statistics. The model was estimated using the period from 1967-68 to 1998-99.

There are potential problems with using a model for local government education expenditures for the nation as a whole. Two such problems concern the variable SGRNT. First, the amount of money which local governments receive for education from state governments varies substantially by state. Second, the formulas used to apportion state moneys for education among local governments vary by state.

Beginning in 1988-89, there was a major change in the survey form used to collect data on current expenditures. This new survey form produces a more complete measure of current expenditures; therefore, the values for current expenditures are not completely comparable to the previously collected numbers. In a crosswalk study, data for a majority of states were also collected for 1986-87 and 198788 that were comparable to data from the new survey form. A comparison of these data with those from the old survey form suggests that the use of the new survey form may have increased the national figure for current expenditures by approximately 1.4 percent over what it would have been if the survey form had not been changed. When the model was estimated, all values for current expenditures before 1988-89 were increased by 1.4 percent.

The results for the model are shown in table A5.1. Each variable affects current expenditures in the direction that would be expected. With high levels of income (PCI) or revenue receipts from state source (SGRNT), the level of spending increases. As the number of pupils increases relative to the population (that is, as ENRPOP increases), the level of spending per pupil falls.

From the cross-sectional studies of the demand for education expenditures, we have an estimate of how sensitive current expenditures are to changes in PCI and ENRPOP. We can compare the results from this model with those from the cross-sectional studies. For this model, an increase in PCI of 1 percent, with SGRNT and ENRPOP held constant, would result in an increase of current expenditures per pupil in fall enrollment of approximately 0.67 percent. With PCI and SGRNT held constant, an increase of 1 percent in ENRPOP would result in a decrease in current expenditures per pupil in fall enrollment of approximately 0.33 percent. Both numbers are well within the range of what has been found in cross-sectional studies.

The results from this model are not completely comparable with those from any of the previous editions of Projections of Education Statistics. First, in earlier editions, average daily attendance, rather than fall enrollment, was used as the measure of enrollment in current expenditure per pupil and the ratio of enrollment to population variables. Second, with this edition the sample period used to
estimate the model began with 1967-68 rather than 1959-60 as with previous editions.

There have been other changes with the model used in earlier editions. As with the previous two editions, the population number for each school year is the Bureau of the Census's July 1 population number for the upcoming school year. In earlier editions, each school year's population number was the average of an economic consulting firm's estimated population numbers of each quarter in that school year. Also, there have been changes in the definition of the disposable income.

Projections for total current expenditures were made by multiplying the projections for current expenditures per pupil in fall enrollment by projections for fall enrollment. The projections for total current expenditures were divided by projections for average daily attendance to produce projections of current expenditures per pupil in average daily attendance. Projections were developed in 1982-84 dollars and then placed in 1999-2000 dollars using the Consumer Price Index. Current-dollar projections were produced by multiplying the constant-dollar projections by projections for the Consumer Price Index. The Consumer Price Index and the other economic variables used in calculating the projections presented in this report were placed in school year terms rather than calendar year terms.

Three alternative sets of projections for current expenditures are presented: the middle alternative projections; the low alternative projections; and the high alternative projections. The alternative sets of projections differ because of varying assumptions about the growth paths for disposable income and revenue receipts from state sources.

The alternative sets of projections for the economic variables, including disposable income, were developed using three economic scenarios prepared by the economic consulting firm DRIWEFA.

DRI•WEFA's February 2001 trend scenario was used as a base for the middle alternative projections of the economic variables. DRI•WEFA's trend scenario depicts a mean of possible paths that the economy could take over the forecast period, barring major shocks. The economy, in this scenario, evolves smoothly, without major fluctuations.

DRI•WEFA's February 2001 pessimistic scenario was used for the low alternative projections and DRI•WEFA's February 2001 optimistic scenario was used for the high alternative projections.

In the middle alternative projections, disposable income per capita rises each year from 2001-02 to

2010-11 at rates between 2.2 percent and 3.8 percent. In the low alternative projections, disposable income per capita ranges between 1.7 percent and 2.9 percent, and in the high alternative projections, disposable income per capita rises at rates between 2.6 percent and 5.2 percent.

The alternative projections for revenue receipts from state sources were produced using the following model:

$$
\begin{aligned}
\ln (\text { SGRNT }) & =\mathrm{b}_{0}+\mathrm{b}_{1} \ln (\text { PERTAX } 1) \\
& +\mathrm{b}_{2} \ln (\text { ENRPOP }) \\
& +\mathrm{b}_{3} \ln (\text { RCPIANN } / \text { RCPIANN } 1)
\end{aligned}
$$

where:
In indicates the natural log;
SGRNT equals local governments' education revenue receipts from state sources, per capita, in constant 1982-84 dollars;

PERTAX1 equals personal taxes and nontax receipts to state and local governments, per capita, in constant 1982-84 dollars lagged one period;

ENRPOP equals the ratio of fall enrollment to the population;

RCPIANN equals the inflation rate measured by the Consumer Price Index; and

RCPIANN1 equals the inflation rate measured by the Consumer Price Index lagged 1 period.

This equation was estimated using the AR1 model for correcting for autocorrelation. The model was estimated using the period from 1967-68 to 1998-99. These models are shown in table A5.1.

The values of the coefficients in this model follow expectations. As state governments receive more revenue (higher PERTAX1), they have more money to send to local governments for education. As the enrollment increases relative to the population (higher ENRPOP), so does the amount of aid going to education. Finally, the real dollar values of revenue receipts from state governments to local governments would fall, other things being equal, in years with rapidly increasing inflation (higher RCPIANN/RCPIANN1).

The model used in the previous four edition of the Projections of Education Statistics was identical to that used in this edition except that average daily attendance rather than fall enrollment had been used in the ratio of enrollment to population variable and sample period used began in 1959-60. The model
used in Projections of Education Statistics to 2006 was identical to the model used in the last four editions except that it contained a second measure of state and local government revenue. In earlier editions, similar models were used except the variables were not in log form.

Three alternative sets of projections for SGRNT were produced using this model. Each is based on a different set of projections for personal taxes and the rate of change in the inflation rate. The middle set of projections was produced using the values from the middle set of alternative projections. The low set of projections was produced using the values from the low set of alternative projections and the high set of projections was produced using the values from the high set of alternative projections. In the middle set of projections, personal taxes and nontax receipts increase at rates between -2.6 percent and 4.2 percent. In the low set of projections, personal taxes and nontax receipts increase at rates between -3.6 percent and 5.8 percent. In the high set of projections, personal taxes and nontax receipts increase at rates between -1.1 percent and 5.6 percent.

In the middle set of projections, revenue receipts from state sources increase at rates between -2.8 percent and 2.3 percent for the period from 2001-02 to 2010-11. In the low set of projections, they increase at rates between -3.4 percent and 2.9 percent. In the high set of projections, they increase at rates between -2.4 percent and 2.8 percent.

## Elementary and Secondary Teacher Salary Model

Most studies conducted on teacher salaries, like those on current expenditures, have used crosssectional data. Unlike current expenditures models, however, the models for teacher salaries from these existing cross-sectional studies cannot easily be reformulated for use with time-series data. One problem is that we do not have sufficient information concerning the supply of qualified teachers who are not presently teaching. Instead, the elementary and secondary salary model contains terms that measure the demand for teachers in the economy.

The elementary and secondary teacher salary model is:

$$
\begin{aligned}
\ln (\text { SALRY }) & =\mathrm{b}_{0}+\mathrm{b}_{1} \ln (\text { CUREXP })+\mathrm{b}_{2} \ln (\text { ENRPOP }) \\
& +\mathrm{b}_{3} \ln (\text { ENR } 1 / \text { ENR2 })
\end{aligned}
$$

## where:

ln indicates the natural log;

SALRY equals the estimated average annual salary of teachers in public elementary and secondary schools in constant 1982-84 dollars;

CUREXP equals current expenditures of public elementary and secondary schools per pupil in fall enrollment in constant 1982-84 dollars;

ENRPOP equals the ratio of average daily attendance to the population;

ENR1 equals the average daily attendance lagged 1 period; and

ENR2 equals the average daily attendance lagged 2 periods.

The model was estimated using the period from 1969-70 to 1998-99. The AR1 model for correcting for autocorrelation was used as the Durbin-Watson statistic was in the inconclusive region when the model was estimated using OLS.

Due to the effects on current expenditures caused by the change in survey forms discussed above, the values for current expenditures for 195960 to 1987-88 were increased by 1.4 percent when the salary model was estimated. The coefficients of the salary model are different than if the unadjusted numbers for current expenditures had been used and hence the forecasts are different.

The results for this model are also shown in table A5.1. There is no literature for comparing the sizes of the coefficients. However, the direction of the impact each variable has on salaries is as expected: as the level of spending per pupil increases (higher CUREXP), more teachers can be hired, so demand for teachers increases and salaries may increase; as the number of students increases (higher ENRPOP and ENR1/ENR2), demand for teachers may increase, so salaries may increase.

The model used in the previous five editions of the Projections of Education Statistics was identical to that used in this edition except that average daily attendance rather than fall enrollment as the measure of enrollment and the sample period used to produce the forecast began in 1959-60 rather than 1969-70. In the seven earlier editions, similar models were used except the variables were not in log form.

As with current expenditures, three different scenarios are presented for teacher salaries. The same projections for ENRPOP and ENR are used for each alternative projection; the sole difference between the projections is in the projection for current expenditures. The middle alternative projection for salaries uses the middle alternative projection for current expenditures. The low
alternative projection for salaries uses the low alternative projection for current expenditures. The high alternative projection for salaries uses the high alternative projection for current expenditures.

Current expenditures, average teacher salaries, and the number of teachers are interrelated; analysis was conducted to see whether the projections of these three time series were consistent.

The number of teachers was multiplied by the average salary and then divided by current expenditures for every school year from 1985-86 until 2010-11 (using the middle alternative projection for teachers, salaries, and current expenditures). The resulting value shows the portion of current expenditures that is spent on teacher salaries. The portion of current expenditures that goes toward teacher salaries has been in a slow downward trend, with the teacher salary share falling from 41 percent in 1985-86 to 38 percent in 199899 . With the projected values, the portion of current expenditures that goes toward teacher salaries continues to fall slowly, falling to 31 percent in 2010-11. The results of this analysis indicate that the projections of these three time series are consistent.

## Projection Accuracy

This is the thirteenth consecutive year in which Projections of Education Statistics has contained projections of current expenditures and teacher salaries. The actual values of current expenditures and teacher salaries can be compared with the projected values in the previous editions to examine the accuracy of the models.

The projections from the various editions of Projections of Education Statistics were placed in 1981-82 dollars using the Consumer Price Indices that appeared in each edition.

In the earlier editions of Projections of Education Statistics, average daily attendance rather than fall enrollment had been used as the measure of enrollment in the calculation of the current expenditure per pupil projection. However, projections of current expenditures per fall enrollment were presented in most of these earlier editions, and projections of fall enrollment are presented in all of these earlier editions. Hence, the projected values of both current expenditures per pupil in fall enrollment and current expenditures per pupil in average daily attendance are compared to their respective actual values.

The similar sets of independent variables have been used in the production of the current expenditure projections presented in the last eleven editions of the Projections of Education Statistics
including this one. There have been some differences in the construction of the variables however. First, as noted, average daily attendance had been used in the previous editions rather than fall. Second, with the Projections of Education Statistics to 1997-98, calendar year data were used for disposable income, the population, and the Consumer Price Index. With the later editions, school year data were used. Third, there have been two revisions in the disposable income time series. Fourth, in the more recent editions, including this one, the Census Bureau's July 1 number for the population has been used. In the earlier editions, an average of the quarterly values was used. Fifth, in the more recent editions, the U.S. Bureau of the Census's population projections have been used. In the earlier editions, the population projections came from an economic consulting firm.

There has also been a change in the estimation procedure. In the more recent editions, the AR1 model for correcting for autocorrelation was used to estimate the model. In the earlier editions, ordinary least squares was used to estimate the model.

There are several commonly used statistics which can be used to evaluate projections. The values for one of these, the mean absolute percentage error (MAPE), are presented in table A2, page 97. MAPEs of expenditure projections are presented for total current expenditures, current expenditures per pupil in fall enrollment, current expenditures per pupil in average daily attendance, and teacher salaries.

To calculate the MAPEs presented in table A2, the projections of each variable were first grouped by lead time, that is: all the projections of each variable that were a given number of years from the last year in the sample period were grouped together. Next, the percent differences between each projection and its actual value were calculated. Finally, for each variable, the mean of the absolute values of the percent differences were calculated, with a separate average for each lead time. These means are the MAPEs. Hence, in table B, there are a series of MAPEs for each variable with a different MAPE for each lead time.

For some editions of the Projections of Education Statistics, the first projection to be listed did not have a lead time of one year. For example, in Projections of Education Statistics to 2002, the first projection to appear was for 1990-91. This projection was calculated using a sample period ending in 1988-89, so it had a lead time of two years. The value that appeared for 1989-1990 was from NCES Early Estimates. Only those projections which appeared in an edition of Projections of Education Statistics were used in this evaluation.

Projections for teacher salaries also appeared in the twelve most recent editions of Projections of Education Statistics. In these earlier editions, average daily attendance rather than fall enrollment had been used as the measure of enrollment. Also, beginning with the Projections of Education Statistics to 2006, there was one major change in the model used for teacher salary projections; all the variables were placed in log form. With this change in functional form, there was also a change in the way the change in enrollment was measured. In the most recent editions, the change in enrollment was measured by taking the ratio of the enrollment (previously average daily attendance) lagged one period to the enrollment lagged two periods. In the previous three editions of Projections of Education Statistics, the change in enrollment was measured by the change from the previous year in enrollment lagged one period. In Projections of Education Statistics to 1997-98, Projections of Education Statistics to 2000, and Projections of Education Statistics to 2001, both the change in average daily attendance lagged one period and the change in average daily attendance lagged two periods were included in the model.

There was another difference between the model used to produce the teacher salary projections in Projections of Education Statistics to 1997-98 and those used in the later editions including this one: variables in the model were calculated using calendar year data for the population and the Consumer Price Index rather than school year data as in previous editions.

## Sources of Past and Projected Data

Numbers from several different sources were used to produce these projections. In some instances, the time series used were made by either combining numbers from various sources or manipulating the available numbers. The sources and the methods of manipulation are described here.

The time series used for current expenditures was compiled from several different sources. For the school years ending in even numbers from 195960 to 1975-76, the numbers for current expenditures were taken from various issues of Statistics of State School Systems, published by NCES. The numbers for the school years ending in odd numbers during the 1960s were taken from various issues of the National Education Association's Estimates of School Statistics. For the school years ending in odd numbers during the 1970s, up to and including 1976-77, the numbers were taken from various issues of Revenues and Expenditures for Public Elementary and Secondary Education, published by

NCES. For the school years from 1977-78 until 1998-99, the numbers were taken from the NCES Common Core of Data survey and unpublished data.

For 1974-75 and 1976-77, expenditures for summer schools were subtracted from the published figures for current expenditures. The value for 1972-73 was the sum of current expenditures at the local level, expenditures for administration by state boards of education and state departments of education, and expenditures for administration by intermediate administrative units.

Note that although the data from the different sources are similar, they are not entirely consistent. Also, the NCES numbers beginning with 1980-81 are not entirely consistent with the earlier NCES numbers, due to differing treatments of items such as expenditures for administration by state governments and expenditures for community services.

An alternative source for current expenditures would have been the Bureau of the Census's F-33 which offers statistics at the district level. This level of detail was not needed, however.

For most years, the sources for the past values of average daily attendance were identical to the sources for current expenditures. For 1978-79, the number was taken from Revenues and Expenditures for Public Elementary and Secondary Education.

Projections for average daily attendance for the period from 1998-99 to 2010-11 were made by multiplying the projections for enrollment by the average value of the ratios of average daily attendance to the enrollment from 1988-89 to 199798 ; this average value was approximately 0.93 .

The values for fall enrollment from 1959-60 to 1977-78 were taken from issues of the NCES publication Statistics of Public Elementary and Secondary Schools. The 1978-79 value was taken from the NCES Bulletin of October 23, 1979, "Selected Public and Private Elementary and Secondary Education Statistics." The values from 1979-80 to 1998-99 were taken from the NCES Common Core of Data survey. The projections for fall enrollment are those presented in Chapter 1.

For 1959-60 to 1998-99, the sources for
revenue receipts from state sources were the two NCES publications Statistics of State School Systems and Revenues and Expenditures for Public Elementary and Secondary Education and the NCES Common Core of Data survey. The methods for producing the alternative projections for revenue receipts from state sources are outlined above.

The estimates for average teacher salaries were taken from various issues of the National Education Association's Estimates of School Statistics.

The projected values for disposable income, personal taxes and nontax receipts to state and local governments, and indirect business taxes and tax accruals to state and local governments, were developed using projections developed by DRI•WEFA's U.S. Quarterly Model. Projected values of the Bureau of Labor Statistics' Consumer Price Index for all urban consumers, which was used for adjusting current expenditures, teacher salaries, revenue receipts from state sources, and the state revenue variables, were also developed using the U.S. Quarterly Model.

Both the historical and projected values for the population were supplied by the U.S. Bureau of the Census.

The values of all the variables from DRI•WEFA were placed in school-year terms. The school-year numbers were calculated by taking the average of the last two quarters of one year and the first two quarters of the next year.

The Elementary and Secondary School Price Index was considered as a replacement for the Consumer Price Index for placing current expenditures and teacher salaries in constant dollars. As projections of the price index are required for placing the forecasts into current dollars, and as there are no projections of the Elementary and Secondary School Price Index, the Consumer Price Index was used. There are other price indexes, such as the implicit price deflator for state and local government purchases, that could have been used instead of the Consumer Price Index. These alternatives would have produced somewhat different projections.

Table A5.1.-Equations for current expenditures per pupil in fall enrollment, estimated average annual salaries of teachers, and education revenue receipts from state sources

| Dependent <br> Variable |  |  | Equation |  | $\mathbf{R}^{2}$ | Durbin-Watson statistic ${ }^{1}$ | Estimation technique ${ }^{2}$ | Rho | Time period |

${ }^{1}$ For an explanation of the Durbin-Watson statistic, see J. Johnston, Econometric Methods, New York: McGraw-Hill, 1972, pages 251-252.
${ }^{2}$ AR1 indicates an estimation procedure for correcting the problem of first-order autocorrelation. For a general discussion of the problem of autocorrelation, and the method used to forecast in the presence of autocorrelation, see G. Judge, W. Hill, R. Griffiths, H. Lutkepohl, and T. Lee,The Theory and Practice of Econometrics,
New York: John Wiley and Sons, 1985, pages 315-318.
Where:
CUREXP $\quad=$ Current expenditures of public elementary and secondary schools per pupil in fall enrollment in constant 1982-84 dollars
SALRY $\quad=$ Average annual salary of teachers in public elementary and secondary schools in constant 1982-84 dollars
SGRNT $=$ Local governments' education revenue receipts from state sources, per capita, in constant 1982-84 dollars
PCI $\quad=$ Disposable income per capita in constant 1996 dollars
ENRPOP $\quad=$ Ratio of fall enrollment to the population
PERTAX1 = Personal taxes and nontax receipts to state and local governments, per capita, in constant 1982-84 dollars lagged one period
RCPIANN $\quad=$ Inflation rate measured by the Consumer Price Index
RCPIANN1 = Inflation rate measured by the Consumer Price Index lagged 1 period
ENR1 = Fall enrollment lagged 1 period
ENR2 = Fall enrollment lagged 2 periods
NOTE: $R^{2}$ indicates the coefficient of determination. Numbers in parentheses are $t$-statistics.

# Appendix C 

## Data Sources

## Sources and Comparability of Data

The information in this report was obtained from many sources, including federal and state agencies, private research organizations, and professional associations. The data were collected by many methods, including surveys of a universe (such as all colleges) or of a sample, and compilations of administrative records. Care should be used when comparing data from different sources. Differences in procedures, such as timing, phrasing of questions, and interviewer training mean that the results from the different sources are not strictly comparable. More extensive documentation of one survey's procedures than of another's does not imply more problems with the data, only that more information is available.

## Accuracy of Data

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. Besides sampling errors, both surveys, universe and sample, are subject to errors of design, reporting, processing, and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures. In general, however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

## Sampling Errors

The standard error is the primary measure of sampling variability. It provides a specific range-with a stated confidence-within which a given estimate would lie if a complete census had been conducted. The chances that a complete census would differ from the sample by less than the standard error are about 68 out of 100 . The chances that the difference would be less than 1.65 times the standard error are about 90 out of 100 . The chances that the difference would be less than 1.96 times the standard error are about 95 out of
100. The chances that it would be less than 2.58 times as large are about 99 out of 100 .

The standard error can help assess how valid a comparison between two estimates might be. The standard error of a difference between two sample estimates that are uncorrelated is approximately equal to the square root of the sum of the squared standard errors of the estimates. The standard error (se) of the difference between sample estimate "a" and sample estimate "b" is:

$$
\mathrm{se}_{\mathrm{a}-\mathrm{b}}=\left(\mathrm{se}_{\mathrm{a}}^{2}+\mathrm{se}_{\mathrm{b}}^{2}\right)^{1 / 2}
$$

Note that most of the standard errors in subsequent sections and in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

## Nonsampling Errors

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors are of two kinds-random and nonrandom. Random nonsampling errors may arise when respondents or interviewers interpret questions differently, when respondents must estimate values, or when coders, keyers, and other processors handle answers differently. Nonrandom nonsampling errors result from total nonresponse (no usable data obtained for a sampled unit), partial or item nonresponse (only a portion of a response may be usable), inability or unwillingness on the part of respondents to provide information, difficulty interpreting questions, mistakes in recording or keying data, errors of collection or processing, and overcoverage or undercoverage of the target universe. Random nonresponse errors usually, but not always, result in an understatement of sampling errors and thus an overstatement of the precision of survey estimates. Because estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both total and partial. Imputations are usually made separately within various groups of sample members that have similar survey characteristics. Imputation for item nonresponse is an acceptable value which is substituted for missing or inconsistent data in a data set.

Although the magnitude of nonsampling errors in the data used in this Projections of Education Statistics is frequently unknown, idiosyncrasies that have been identified are noted on the appropriate tables.

## Federal Agency Sources

## National Center for Education Statistics (NCES)

## Common Core of Data

NCES uses the Common Core of Data (CCD) survey to acquire and maintain statistical data from each of the 50 states, the District of Columbia, the Bureau of Indian Affairs, Department of Defense Dependents' Schools (overseas) and the outlying areas. Information about staff and students is collected annually at the school, local education agency or school district (LEA), and state levels. Information about revenues and expenditures is also collected at the state and LEA levels.

Data are collected for a particular school year (October 1 through September 30) via survey instruments sent to the state education agencies during the school year. States have 1 year in which to modify the data originally submitted.

Since the CCD is a universe survey, the CCD information presented in this edition of the Projections of Education Statistics is not subject to sampling errors. However, nonsampling errors could come from two sources-nonreturn and inaccurate reporting. Almost all of the states submit the six CCD survey instruments each year, but submissions are sometimes incomplete or too late for publication.

Understandably, when 58 education agencies compile and submit data for approximately 90,000 public schools and 16,000 local school districts, misreporting can occur. Typically, this results from varying interpretations of NCES definitions and differing recordkeeping systems. NCES attempts to minimize these errors by working closely with the state education agencies through the National Forum on Education Statistics.

The state education agencies report data to NCES
from data collected and edited in their regular reporting cycles. NCES encourages the agencies to incorporate into their own survey systems the NCES items they do not already collect so that those items will also be available for the subsequent CCD survey. Over time, this has meant fewer missing data cells in each state's response, reducing the need to impute data.

NCES subjects data from the education agencies to a comprehensive edit. Where data are determined to be inconsistent, missing, or out of range, NCES contacts the education agencies for verification. NCES-prepared state summary forms are returned to the state education agencies for verification. States are also given an opportunity to revise their state-level aggregates from the previous survey cycle.

Further information on CCD may be obtained from:

## Private School Universe Survey

The purposes of Private School Survey (PSS) data collection activities are to build an accurate and complete list of private schools to serve as a sampling frame for NCES sample surveys of private schools; and to report data on the total number of private schools, teachers, and students in the survey universe. The PSS is conducted every 2 years, with collections in 1989-90, 1991-92, 1993-94, 1995-96, 1997-98, and 1999-2000 school years. The next survey will be in the 2001-02 school year.

The PSS produces data similar to that of the CCD for the public schools, and can be used for publicprivate comparisons. The data are useful for a variety of policy and research-relevant issues, such as the growth of religiously affiliated schools, the number of private high school graduates, the length of the school year for various private schools, and the number of private school students and teachers.

The target population for the universe survey consists of all private schools in the United States that meet NCES criteria of a school (e.g., private school is an institution which provides instruction for any of grades K through 12 , has one or more teachers to give instruction, is not administered by a public agency, and is not operated in a private home). The survey
universe is composed of schools identified from a variety of sources. The main source is a list frame, initially developed for the 1989-90 PSS. The list is updated regularly, matching it with lists provided by nationwide private school associations, state departments of education, and other national guides and sources which list private schools. The other source is an area frame search in approximately 120 geographic areas, conducted by the Bureau of the Census.

Further information on PSS may be obtained from:

## Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys approximately 10,000 postsecondary institutions, including universities and colleges, as well as institutions offering technical and vocational education beyond the high school level. This survey, which began in 1986, replaced the Higher Education General Information Survey (HEGIS).

IPEDS consists of several integrated components that obtain information on who provides postsecondary education (institutions), who participates in it and completes it (students), what programs are offered and what programs are completed, and both the human and financial resources involved in the provision of institutionally based postsecondary education. Specifically, these components include: Institutional Characteristics, including instructional activity; Fall Enrollment, including age and residence; Completions; Finance; Staff; Salaries of Full-Time Instructional Faculty; and Graduation Rate.

The degree-granting institutions portion of this survey is a census of colleges awarding associate's or higher degrees and that were eligible to participate in Title IV financial aid programs. Prior to 1993, data from the technical and vocational institutions were collected through a sample survey. Beginning in 1993, all data are gathered in a census of all postsecondary institutions. The tabulations on "Institutional Characteristics" developed for this edition of the Projections of Education Statistics are
based on lists of all institutions and are not subject to sampling errors.

The definition of institutions generally thought of as offering college and university education has been changed in recent years. The old standard for higher education institutions included those institutions that had courses that led to an associate degree or higher, or were accepted for credit towards those degrees. The higher education institutions were accredited by an agency or association that was recognized by the U.S. Department of Education or recognized directly by the Secretary of Education. The current category includes institutions which award associate or higher level degrees that are eligible to participate in Title IV federal financial aid programs. Tables that contain any data according to this standard are titled as "degree-granting" institutions. The impact of this change has generally not been large. For example, tables on faculty salaries and benefits were only affected to a very small extent. Also, degrees awarded at the bachelor's level or higher were not heavily affected. Most of the data on public 4-year colleges has been affected only to a minimal extent. The impact on enrollment in public 2-year colleges was noticeable in certain states, but relatively small at the national level. The largest impact has been on private 2 -year college enrollment. Overall, enrollment for all institutions was about one-half a percent higher for degree-granting institutions compared to the total for higher education institutions.

Prior to the establishment of IPEDS in 1986, HEGIS acquired and maintained statistical data on the characteristics and operations of institutions of higher education. Implemented in 1966, HEGIS was an annual universe survey of institutions accredited at the college level by an agency recognized by the Secretary of the U.S. Department of Education. These institutions were listed in NCES' Education Directory, Colleges and Universities.

HEGIS surveys solicited information concerning institutional characteristics, faculty salaries, finances, enrollment, and degrees. Since these surveys were distributed to all higher education institutions, the data presented are not subject to sampling error. However, they are subject to nonsampling error, the sources of which varied with the survey instrument. Information concerning the nonsampling error of the enrollment and degrees surveys draws extensively on the HEGIS Post-Survey Validation Study conducted in 1979.

Institutional Characteristics This survey provides the basis for the universe of institutions presented in the Directory of Postsecondary Institutions. The survey collects basic information necessary to classify the institutions, including control, level, and kinds of programs; information on tuition, fees, and room and board charges; and unduplicated full-year enrollment counts and instructional activity. The overall response rate was 96.6 percent for 1998.

Fall Enrollment This survey has been part of the HEGIS and IPEDS series since 1966. The enrollment survey response rate is relatively high. The 1998 overall response rate was 91.8 percent for degreegranting institutions. Major sources of nonsampling error for this survey as identified in the 1979 report were classification problems, the unavailability of needed data, interpretation of definitions, the survey due date, and operational errors. Of these, the classification of students appears to have been the main source of error. Institutions had problems in correctly classifying first-time freshmen and other first-time students for both full-time and part-time categories. These problems occurred most often at 2 -year institutions (private and public) and private 4 -year institutions. In the 1977-78 HEGIS validation studies, the classification problem led to an estimated overcount of 11,000 full-time students and an undercount of 19,000 part-time students. Although the ratio of error to the grand total was quite small (less than 1 percent), the percentage of errors was as high as 5 percent for detailed student levels and even higher at certain aggregation levels.

Beginning in fall 1986, the survey system was redesigned with the introduction of IPEDS (see above). The survey allows (in alternating years) for the collection of age and residence data.

Completions This survey was part of the HEGIS series throughout its existence. However, the degree classification taxonomy was revised in 1970-71, 1982-83, and 1991-92. Collection of degree data has been maintained through the IPEDS system.

Though information from survey years 1970-71 through 1981-82 is directly comparable, care must be taken if information before or after that period is included in any comparison. The "Degrees-conferred" trend tables arranged by the 1991-92 classification are included in the Projections of Education Statistics to provide consistent data from 1970-71 to the most recent year. Data in this edition on associate and other formal awards below the baccalaureate, by field of study, cannot be made comparable with figures prior to 1982-83. The nonresponse rate did not appear to be a significant source of nonsampling error for this survey. The return rate over the years has been high, with the degree-granting institutions response rate for the 1997-98 survey at 92.3 percent. Because of the high return rate for degree-granting institutions, nonsampling error caused by imputation is also minimal. The overall response rate that includes the non-degree granting institutions was 73.8 percent in 1997-98.

The major sources of nonsampling error for this survey were differences between the NCES program taxonomy and taxonomies used by the colleges, classification of double majors, operational problems, and survey timing. In the 1979 HEGIS validation study, these sources of nonsampling contributed to an error rate of 0.3 percent overreporting of bachelor's degrees and 1.3 percent overreporting of master's degrees. The differences, however, varied greatly among fields. Over 50 percent of the fields selected for the validation study had no errors identified. Categories of fields that had large differences were business and management, education, engineering, letters, and psychology. It was also shown that differences in proportion to the published figures were less than 1 percent for most of the selected fields that had some errors. Exceptions to these were: master's and Ph.D. programs in labor and industrial relations (20 percent and 8 percent); bachelor's and master's programs in art education ( 3 percent and 4 percent); bachelor's and Ph.D. programs in business and commerce, and in distributive education (5 percent
and 9 percent); master's programs in philosophy ( 8 percent); and Ph.D. programs in psychology (11 percent).

Financial Statistics This survey was part of the HEGIS series and has been continued under the IPEDS system. Changes were made in the financial survey instruments in fiscal years (FY) 1976, 1982, and 1987. The FY 76 survey instrument contained numerous revisions to earlier survey forms and made direct comparisons of line items very difficult. Beginning in FY 82, Pell Grant data were collected in the categories of federal restricted grants and contracts revenues and restricted scholarships and fellowships expenditures. The introduction of IPEDS in the FY 87 survey included several important changes to the survey instrument and data processing procedures. While these changes were significant, considerable effort has been made to present only comparable information on trends in this report and to note inconsistencies. Finance tables for this publication have been adjusted by subtracting the largely duplicative Pell Grant amounts from the later data to maintain comparability with pre-FY 82 data.

Possible sources of nonsampling error in the financial statistics include nonresponse, imputation, and misclassification. The response rate has been about 85 to 90 percent for most of the years reported. The response rate for the FY 97 survey was 95.1 percent for degree-granting institutions.

Two general methods of imputation were used in HEGIS. If the prior year's data were available for a nonresponding institution, these data were inflated using the Higher Education Price Index and adjusted according to changes in enrollments. If no previous year's data were available, current data were used from peer institutions selected for location (state or region), control, level, and enrollment size of institution. In most cases estimates for nonreporting institutions in IPEDS were made using data from peer institutions.

Beginning with FY 87, the IPEDS survey system included all postsecondary institutions, but maintained comparability with earlier surveys by allowing 2- and

4 -year institutions to be tabulated separately. For FY 87 through FY 91, in order to maintain comparability with the historical time series of HEGIS institutions, data were combined from two of the three different survey forms that make up the IPEDS survey system. The vast majority of the data were tabulated from Form 1, which was used to collect information from public and private nonprofit 2- and 4-year colleges. Form 2, a condensed form, was used to gather data for the 2 -year proprietary institutions. Because of the differences in the data requested on the two forms, several assumptions were made about the Form 2 reports so that their figures could be included in the institutions of higher education totals.

In IPEDS, the Form 2 institutions were not asked to separate appropriations from grants and contracts, nor state from local sources of funding. For the Form 2 institutions, all the federal revenues were assumed to be federal grants and contracts and all of the state and local revenues were assumed to be restricted state grants and contracts. All other Form 2 sources of revenue, except for tuition and fees and sales and services of educational activities, were included under "other." Similar adjustments were made to the expenditure accounts. The Form 2 institutions reported instruction and scholarship and fellowship expenditures only. All other educational and general expenditures were allocated to academic support.

To reduce reporting error, NCES uses national standards for reporting finance statistics. These standards are contained in College and University Business Administration: Administrative Services (1974 Edition), and the Financial Accounting and Reporting Manual for Higher Education (1990 Education), published by the National Association of College and University Business Officers; Audits of Colleges and Universities (as amended August 31, 1974), by the American Institute of Certified Public Accountants; and HEGIS Financial Reporting Guide (1980), by NCES. Wherever possible, definitions and formats in the survey form are consistent with those in these four accounting texts.

## Bureau of the Census

## Current Population Survey

Current estimates of school enrollment rates, as well as social and economic characteristics of students, are based on data collected in the Census Bureau's monthly household survey of about 50,000 dwelling units. The monthly Current Population Survey (CPS) sample consists of 729 areas comprising 1,973 counties, independent cities, and minor civil divisions throughout the 50 states and the District of Columbia. The samples are initially selected based on the decennial census files and are periodically updated to reflect new housing construction.

The monthly CPS deals primarily with labor force data for the civilian noninstitutional population (i.e., excluding military personnel and their families living on post and inmates of institutions). In addition, in October of each year, supplemental questions are asked about highest grade completed, level and grade of current enrollment, attendance status, number and type of courses, degree or certificate objective, and type of organization offering instruction for each member of the household. In March of each year, supplemental questions on income are asked. The responses to these questions are combined with answers to two questions on educational attainment: highest grade of school ever attended, and whether that grade was completed.

The estimation procedure employed for monthly CPS data involves inflating weighted sample results to independent estimates of characteristics of the civilian noninstitutional population in the United States by age, sex, and race. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the population in the armed services. Generalized standard error tables are provided in the Current Population Reports. The data are subject to both nonsampling and sampling errors.

Further information on CPS may be obtained from:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce

Washington, DC 20233
http://www.bls.census.gov/cps/cpsmain.htm
School Enrollment Each October, the Current Population Survey (CPS) includes supplemental questions on the enrollment status of the population 3
years old and over, in addition to the monthly basic survey on labor force participation. The main sources of nonsampling variability in the responses to the supplement are those inherent in the survey instrument. The question of current enrollment may not be answered accurately for various reasons. Some respondents may not know current grade information for every student in the household, a problem especially for households with members in college or in nursery school. Confusion over college credits or hours taken by a student may make it difficult to determine the year in which the student is enrolled. Problems may occur with the definition of nursery school (a group or class organized to provide educational experiences for children), where respondents' interpretations of "educational experiences" vary.

The 1997 CPS sample was selected from the 1990 Decennial Census files with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. The United States was divided into 2,007 geographic areas. In most states, a geographic area consists of a county or several contiguous counties. In some areas of New England and Hawaii, minor civil divisions are used instead of counties. A total of 754 geographic areas were selected for the sample. About 50,000 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 3,200 of these units. This occurs when the occupants are not found at home after repeated calls or are unavailable for some other reason. For the October 1997 basic CPS, the nonresponse rate was 6.3 percent and for the school enrollment supplement the nonresponse rate was an additional 4.7 percent for a total school supplement nonresponse rate of 10.7 percent.

Further information on CPS methodology may be obtained from:
http://www.bls.census.gov/cps/cpsmain.htm

http://www.census.gov/population/www/socdemo/sc hool.html

State population projections. These state population projections were prepared using a cohort-component method by which each component
of population change-births, deaths, state-to-state migration flows, international in-migration, and international out-migration-was projected separately for each birth cohort by sex, race, and Hispanic origin. The basic framework was the same as in past Census Bureau projections.

Detailed components necessary to create the projections were obtained from vital statistics, administrative records, census data, and national projections.

The cohort-component method is based on the traditional demographic accounting system:
$\mathrm{P}_{1}=\mathrm{P}_{0}+\mathrm{B}-\mathrm{D}+\mathrm{DIM}-\mathrm{DOM}+\mathrm{IIM}-\mathrm{IOM}$
where:
$P_{1} \quad=$ population at the end of the period
$\mathrm{P}_{0} \quad=$ population at the beginning of the period
B $\quad=$ births during the period
D = deaths during the period
DIM $=$ domestic in-migration during the period
DOM $=$ domestic out-migration during the period
IIM = international in-migration during the period
$\mathrm{IOM}=$ international out-migration during the period
To generate population projections with this model, the Census Bureau created separate data sets for each of these components. In general, the assumptions concerning the future levels of fertility, mortality, and international migration are consistent with the assumptions developed for the national population projections of the Census Bureau.

Once the data for each component were developed, it was a relatively straightforward process to apply the cohort-component method and produce the projections. For each projection year the base population for each state was disaggregated into eight race and Hispanic categories (non-Hispanic white; non-Hispanic black; non-Hispanic American Indian, Eskimo, and Aleut; non-Hispanic Asian and Pacific Islander; Hispanic white; Hispanic black; Hispanic American Indian, Eskimo, and Aleut; and Hispanic Asian and Pacific Islander), by sex, and single year of age (ages 0 to $85+$ ). The next step was to survive each age-sex-race-ethnic group forward 1 year using the pertinent survival rate. The internal redistribution of the population was accomplished by applying the
appropriate state-to-state migration rates to the survived population in each state. The projected out-migrants were subtracted from the state of origin and added to the state of destination (as in-migrants). Next, the appropriate number of immigrants from abroad were added to each group. The populations under age 1 were created by applying the appropriate age-race-ethnic-specific birth rates to females of childbearing age. The number of births by sex and race/ethnicity were survived forward and exposed to the appropriate migration rate to yield the population under age 1 . The final results of the projection process were adjusted to be consistent with the national population projections by single years of age, sex, race, and Hispanic origin. The entire process was then repeated for each year of the projection.

National population projections. The method used to produce projections of the United States population for future reference dates from a current base population reflects three fundamental principles. First, the projections are demographic. Future populations are derived from a base population through the projection of population change by its major demographic components, births, deaths, and migration. Second, the projection of the demographic components of change is driven by the composition of the population by age, sex, race, Hispanic origin, and nativity, and the way these variables determine the propensity to bear children, die, migrate to or from the United States. Third, the definition of the population with respect to who is included and the characteristics of included people remains the same throughout the projection period. We refer to these definitions collectively throughout the work as the "population universe." This concept embraces such issues as the inclusion or exclusion of people uncounted by a census, the rule defining residency in the United States, and the way we classify people by age, race, and Hispanic origin.

For more information, see "Methodology and Assumptions for the Population Projections of the United States: 1999 to 2100," Population Division Working Paper No. 38. This report is available on the

INTERNET at http://www.census.gov.

## Other Sources

## National Education Association

## Estimates of School Statistics

The National Education Association (NEA) reports teacher, revenue, and expenditure data in its annual publication, Estimates of School Statistics. Each year, NEA prepares regression-based estimates of financial and other education statistics and submits them to the states for verification. Generally, about 30 states adjust these estimates based on their own data. These preliminary data are published by NEA along with revised data from previous years. States are asked to revise previously submitted data as final figures become available. The most recent publication contains all changes reported to the NEA.

## Glossary

## Data Terms

Associate's degree: A degree granted for the successful completion of a subbaccalaureate program of studies, usually requiring at least 2 years (or the equivalent) of full-time college-level study. This term includes degrees granted in a cooperative or work-study program.

Average daily attendance (ADA): The aggregate attendance of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered days in session.

Average daily membership (ADM): The aggregate membership of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered as days in session. The average daily membership for groups of schools having varying lengths of terms is the average of the average daily memberships obtained for the individual schools.

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or the equivalent) of full-time college-level study. This term includes degrees granted in a cooperative or work-study program.

Classroom teacher: A staff member assigned the professional activities of instructing pupils in selfcontained classes or courses, or in classroom situations. Usually expressed in full-time equivalents.

Cohort: A group of individuals that have a statistical factor in common, for example, year of birth.

College: A postsecondary school that offers a general or liberal arts education, usually leading
to an associate, bachelor's, master's, doctor's, or first-professional degree. Junior colleges and community colleges are included in this term.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer Price Index (CPI): This price index measures the average change in the cost of a fixed market basket of goods and services purchased by consumers.

Current dollars: Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures (elementary/secondary): The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs.

Current expenditures per pupil in average daily attendance: Current expenditures for the regular school term divided by the average daily attendance of full-time pupils (or full-timeequivalency of pupils) during the term. See also current expenditures and average daily attendance.

Current-fund expenditures (higher education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships and fellowships, auxiliary enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Current Population Survey: See Appendix C, Data Sources.

Degree-granting institutions: Postsecondary institutions that are eligible for Title IV federal financial aid programs and that grant an associate's or higher degree. For an institution to
be eligible to participate in Title IV financial aid programs it must offer a program of at least 300 clock hours in length, have accreditation recognized by the U.S. Department of Education, have been in business for at least 2 years, and have signed a participation agreement with the Department.

Disposable income: Current income received by persons less their contributions for social insurance, personal tax, and nontax payments. It is the income available to persons for spending and saving. Nontax payments include passport fees, fines and penalties, donations, and tuitions and fees paid to schools and hospitals operated mainly by the government. See also personal income.

Doctor's degree: An earned degree carrying the title of doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.), musical arts (D.M.A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading.

Educational and general expenditures: The sum of current funds expenditures on instruction, research, public service, academic support, student services, institutional support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Elementary school: A school classified as elementary by state and local practice and composed of any span of grades not above grade 8. A preschool or kindergarten school is included under this heading only if it is an integral part of an elementary school or a regularly established school system.

Elementary and secondary schools: As used in this publication, includes only regular schools,
that is, schools that are part of state and local school systems and also most private elementary and secondary schools, both religiously affiliated and nonsectarian. Schools not included in this term are subcollegiate departments of institutions of higher education, American residential schools for exceptional children, federal schools for Indians, and federal schools on military posts and other federal installations.

Enrollment: The number of students registered in a given school unit at a given time, generally in the fall of a year.

Expenditures: Charges incurred, whether paid or unpaid, that are presumed to benefit the current fiscal year. For elementary and secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, or extension of credit. Government expenditures include only external transactions, such as the provision of perquisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit of measure, such as average daily attendance or average daily membership.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is based on a program requiring at least 2 academic years of work before entrance and a total of at least 6 academic years of work to complete the degree program, including both prior required college work and the professional program itself. By NCES definition, firstprofessional degrees are awarded in the fields of dentistry (D.D.S. or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Phar.), podiatry (D.P.M.), veterinary
medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (LL.B. or J.D.), and theological professions (M.Div. or M.H.L.).

First-professional enrollment: The number of students enrolled in a professional school or program that requires at least 2 years of academic college work for entrance and a total of at least 6 years for a degree. By NCES definition, firstprofessional enrollment includes only students in certain programs. (See first-professional degree for a list of programs.)

Full-time enrollment: The number of students enrolled in higher education courses with total credit load equal to at least 75 percent of the normal full-time course load.

Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to fulltime enrollment.

Full-time worker: In educational institutions, an employee whose position requires being on the job on school days throughout the school year at least the number of hours the schools are in session; for higher education, a member of an educational institution's staff who is employed full time.

Graduate: An individual who has received formal recognition for the successful completion of a prescribed program of studies.

Graduate enrollment: The number of students who hold the bachelor's or first-professional degree, or the equivalent, and who are working toward a master's or doctor's degree. Firstprofessional students are counted separately. These enrollment data measure those students who are registered at a particular time during the fall. At some institutions, graduate enrollment also includes students who are in postbaccalaureate classes but not in degree programs.

High school: A secondary school offering the final years of high school work necessary for graduation, usually including grades 10,11 , and 12 (in a 6-3-3 plan), or grades $9,10,11$, and 12 (in a 6-2-4 plan).

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate, baccalaureate, or higher degree.

## Higher education institutions (traditional classifications):

4-year institution: An institution legally authorized to offer and offering at least a 4 -year program of college-level studies wholly or principally creditable toward a bachelor's degree. A university is a postsecondary institution that typically includes one or more graduate professional schools.

2-year institution: An institution legally authorized to offer and offering at least a 2 -year program of college-level studies that terminates in an associate degree or is principally creditable toward a baccalaureate.

See also degree-granting institutions and postsecondary education.

Higher Education Price Index: A price index which measures average changes in the prices of goods and services purchased by colleges and universities through current-fund expenditures and educational and general expenditures (excluding expenditures for sponsored research and auxiliary enterprises).

Instructional staff: Full-time-equivalent number of positions, not the number of individuals occupying the positions during the school year. In local schools, it includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or the improvement of the teaching-learning situation. This includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel,
and other instructional staff. This excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree (M.A.) and the Master of Science degree (M.S.), is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, or an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load of less than 75 percent of the normal full-time credit load.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as "persons" are individuals (including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private noninsured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits, military pensions, and so forth, but excludes transfers among persons.

Postbaccalaureate enrollment: The number of graduate and first-professional students working toward advanced degrees and students enrolled in graduate-level classes but not enrolled in degree programs. See also graduate enrollment and firstprofessional enrollment.

Postsecondary education: The provision of formal instructional programs with a curriculum designed primarily for students who have completed the requirements for a high school diploma or equivalent. This includes programs of an academic, vocational, and continuing professional education purpose, and excludes avocational and adult basic education programs.

Private institution: A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government; that is usually supported primarily by other than public funds; and the operation of whose program rests with other than publicly elected or appointed officials.

Property tax: The sum of money collected from a tax levied against the value of property.

Public school or institution: A school or institution controlled and operated by publicly elected or appointed officials and generally deriving its primary support from public funds.

Pupil-teacher ratio: The enrollment of pupils at a given period of time, divided by the full-timeequivalent number of classroom teachers serving these pupils during the same period.

Revenue receipts: Additions to assets that do not incur an obligation that must be met at some future date and do not represent exchanges of property for money. Assets must be available for expenditures.

Revenues: All funds received from external sources, net of refunds and correcting transactions. Noncash transactions such as receipt of services, commodities, or other receipts "in kind" are excluded, as are funds received from the issuance of debt, liquidation of investments, or nonroutine sale of property.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

School: A division of the school system consisting of students in one or more grades or
other identifiable groups and organized to give instruction of a defined type. One school may share a building with another school or one school may be housed in several buildings.

Secondary instructional level: The general level of instruction provided for pupils in secondary schools (generally covering grades 7 through 12 or 9 through 12) and any instruction of a comparable nature and difficulty provided for adults and youth beyond the age of compulsory school attendance.

Secondary school: A school including any span of grades beginning with the next grade following an elementary or middle school (usually 7,8 , or 9 ) and ending with or below grade 12 . Both junior high schools and senior high schools are included.

Senior high school: A secondary school offering the final years of high school work necessary for graduation.

Student: An individual for whom instruction is provided in an educational program under the jurisdiction of a school, school system, or other educational institution. No distinction is made between the terms "student" and "pupil," although "student" may refer to one receiving instruction at any level while "pupil" refers only to one attending school at the elementary or secondary level. The term "student" is used to include individuals at all instructional levels. A student
may receive instruction in a school facility or in another location, such as at home or in a hospital. Instruction may be provided by direct studentteacher interaction or by some other approved medium, such as television, radio, telephone, or correspondence.

Tax base: The collective value of sales, assets, and income components against which a tax is levied.

Total expenditure per pupil in average daily attendance: Includes all expenditures allocable to per pupil costs divided by average daily attendance. These allocable expenditures include current expenditures for regular school programs, interest on school debt, and capital outlay. Beginning in 1980-81, expenditures for administration by state governments are excluded and expenditures for other programs (summer schools, community colleges, and private schools) are included.

Unclassified students: Students who are not candidates for a degree or other formal award, although they are taking higher education courses for credit in regular classes with other students.

Undergraduate students: Students registered at an institution of higher education who are working in a program leading to a baccalaureate or other formal award below the baccalaureate, such as an associate degree.

## Statistical Terms

Autocorrelation: Correlation of the error terms from different observations of the same variable. Also called serial correlation.

Degrees of freedom: The number of free or linearly independent sample observations used in the calculation of a statistic. In a time series regression with t time period and k independent variables including a constant term, there would be t minus k degrees of freedom.

Dependent variable: A mathematical variable whose value is determined by that of one or more other variables in a function. In regression analysis, when a random variable, $y$, is expressed as a function of variables $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots$, plus a stochastic term, then y is known as the "dependent variable."

Double exponential smoothing: A method that takes a single smoothed average component of demand and smoothes it a second time to allow for estimation of a trend effect.

Durbin-Watson statistic: A statistic testing the independence of errors in least squares regression against the alternative of first-order serial correlation. The statistic is a simple linear transformation of the first-order serial correlation of residuals and, although its distribution is unknown, it is tested by bounding statistics that follow R. L. Anderson's distribution.

Econometrics: The quantitative examination of economic trends and relationships using statistical techniques, and the development, examination, and refinement of those techniques.

Estimate: A numerical value obtained from a statistical sample and assigned to a population parameter. The particular value yielded by an estimator in a given set of circumstances or the rule by which such particular values are calculated.

Estimating equation: An equation involving observed quantities and an unknown that serves to estimate the latter.

Estimation: Estimation is concerned with inference about the numerical value of unknown population values from incomplete data, such as a sample. If a single figure is calculated for each unknown parameter, the process is called point estimation. If an interval is calculated within which the parameter is likely, in some sense, to lie, the process is called interval estimation.

Exogenous variable: Variables for which the values are determined outside the model but which influence the model.

Exponential smoothing: A method used in time series to smooth or to predict a series. There are various forms, but all are based on the supposition that more remote history has less importance than more recent history.

First-order serial correlation: When errors in one time period are correlated directly with errors in the ensuing time period. Also called autocorrelation.

Forecast: An estimate of the future based on rational study and analysis of available pertinent data, as opposed to subjective prediction.

Forecasting: Assessing the magnitude which a quantity will assume at some future point in time, as distinct from "estimation," which attempts to assess the magnitude of an already existent quantity.

Forecast horizon: The number of time periods into the future which are forecasted. Forecasts for next year are said to have a 1 -year forecast horizon.

Function: A mathematical correspondence that assigns exactly one element of one set to each element of the same or another set. A variable that depends on and varies with another.

Functional form: A mathematical statement of the relationship among the variables in a model.

Independent variable: In regression analysis, when a random variable, $y$, is expressed as a function of variables $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots$, plus a stochastic term, the $\mathrm{x}^{\prime} \mathrm{s}$ are known as "independent variables."

Lag: An event occurring at time $\mathrm{t}+\mathrm{k}(\mathrm{k}>0)$ is said to lag behind an event occurring at time $t$, the extent of the lag being k . An event occurring k time periods before another may be regarded as having a negative lag.

Maximum likelihood estimation: A method of estimating a parameter or parameters of a population by that value (or values) that maximizes (or maximize) the likelihood of a sample.

Mean absolute percentage error (MAPE): The average value of the absolute value of errors expressed in percentage terms.

Model: A system of postulates, data, and inferences presented as a mathematical description of a phenomenon such as an actual system or process. The actual phenomenon is represented by the model in order to explain it, to predict it, and to control it.

Ordinary least squares (OLS): The estimator that minimizes the sum of squared residuals.

Parameter: A quantity that describes a statistical population.

Projection: In relation to a time series, an estimate of future values based on a current trend.
$\mathbf{R}^{\mathbf{2}}$ : The coefficient of determination; the square of the correlation coefficient between the dependent variable and its OLS estimate.
$\mathbf{R}^{\mathbf{2}}$ (also called the adjusted $\mathbf{R}^{\mathbf{2}}$ ): The coefficient of determination adjusted for the degrees of freedom.

Regression analysis: A statistical technique for investigating and modeling the relationship between variables.

Rho: A measure of the correlation coefficient between errors in time period $t$ and time period $t$ minus 1 .

Serial correlation: Correlation of the error terms from different observations. Also called autocorrelation.

Standard error of estimate: An expression for the standard deviation of the observed values about a regression line. An estimate of the variation likely to be encountered in making predictions from the regression equation.

Time series: A set of ordered observations on a quantitative characteristic of an individual or collective phenomenon taken at different points in time. Usually the observations are successive and equally spaced in time.

Time series analysis: The branch of quantitative forecasting in which data for one variable are examined for patterns of trend, seasonality, and cycle.

Variable: A quantity that may assume any one of a set of values.

## Appendix E

# 1999 IPEDS (Fall Enrollment) Survey Methodology 

## Overview

Fall 1999 enrollment data collected through the National Center for Education Statistics (NCES) represent 3,958 degree-granting postsecondary institutions that are eligible to participate in Title IV programs (financial aid) in the United States. Table E1 includes only those institutions in the 50 states and the District of Columbia. The 1999 Fall Enrollment survey (either EF1 or EF2) was sent to the universe institutions accredited at the collegiate level and to all other institutions offering a bachelor's, master's, doctor's or first-professional degree. The Fall Enrollment (EF) survey is conducted annually as part of the National Center for Education Statistics' Integrated Postsecondary Education Data System (IPEDS). Eligibility status of institutions was obtained from the Office of Postsecondary Education's 1998 Postsecondary Education Participants System (PEPS) file.

The 1999 Fall Enrollment Survey data currently available in a peer tool on the NCES web site do not permit national estimates. The peer tool includes only those institutions that reported data that passed various edit checks. To calculate national totals, data for nonresponding institutions were imputed using procedures described in this appendix and added to data reported by institutions.

Students included in the Fall Enrollment survey were students enrolled in courses toward a degree or other formal award; students enrolled in courses that are a part of a vocational or occupational program, including those enrolled in off-campus centers; and high school students taking regular college courses for credit. Students excluded from the Fall Enrollment survey were students enrolled exclusively in courses not creditable toward a formal award and not in a postsecondary vocational program, students enrolled exclusively in remedial courses; students exclusively auditing classes; students studying abroad (e.g., at a foreign university) if their enrollment at the institution is only an administrative record and the fee is only nominal; and students in any branch campus located
in a foreign country; and students earning continuing units (CEU's) only.

There are two versions of the Fall Enrollment survey. The most extensive form, EF1, was sent to all 4-year institutions. The EF2 form is less detailed and was sent to 2 -year postsecondary institutions that grant an associate's degree (degree-granting).

## Universe, Institutions Surveyed and Response Rates

A universe of postsecondary institutions was initially established as being eligible to participate in Title IV programs by the IPEDS 1998-99 Institutional Characteristics Survey. Fall Enrollment Survey forms were mailed in July 1999. The survey results were collected from November 1999 through June 2000. During this time period, some institutions determined to be out-of-scope were deleted from the universe. These deletions resulted from formal notification by IPEDS state coordinators, the Department of Education eligibility notices, and from follow-up telephone calls. Included in the deletions were (1) duplicates of other institutions on the file; (2) institutions that no longer offered postsecondary programs; or (3) schools that did not conform to the IPEDS definition of an institution or branch. At the end of the process, 3,958 institutions were in the final 1999 fall enrollment universe. The final universe was also adjusted to reflect institutions that changed from one sector to another subsequent to survey mail out.

Table E2 shows the number of institutions that responded to the mail out of the 1999 Fall Enrollment survey by level and their enrollment. It also reports the total number of institutions in the survey universe, and the final imputed enrollment. The table shows the response rate as the proportion of the survey universe that reported to the survey both in terms of counts of institutions and in terms of their enrollment.

## Survey Conduct and Editing

The 1999 Fall Enrollment survey was due November 15. Survey data were collected via paper or transmitted NCES via the Internet. Some institutions submitted data on diskette. Data for nonresponding less than 2 -year institutions were collected through the Postsecondary Education Telephone System (PETS). All data, whether received on paper forms, diskettes, electronically via the Internet, or through the PETS system, went through the same editing process. Extensive followup for survey nonresponse was conducted from November 1999 through April 2000. Initially, reminder letters were mailed, encouraging nonresponding institutions to complete and return their forms; and subsequently, the PETS was used to collect critical data by telephone from an institutional representative.

Survey responses were edited for internal and inter-year consistency. The following editing procedures were used:

Part A: Enrollment, by Sex and Race/ethnicity
Addition checks were performed by adding down the columns and comparing generated totals with reported totals. If the reported total differed from the generated total but was within a designated range, the reported total was replaced by the generated total and the cell was flagged with the proper impute code. If the difference exceeded the designated range, institutions were contacted for verification/correction. Addition checks were also performed by generating totals for men and women by adding across columns (racial/ethnic group) in each line. Generated totals by sex were compared to the reported totals. If they differed but were within a designated range, a balance field was created containing the difference by sex and placed on the data file. Reported detail and totals were not altered. If the difference exceeded the designated range, institutions were contacted for correction. Editing of the racial/ethnic data is explained in detail in the section on raking of racial/ethnic data. Comparisons were also made with the number of students reported for the selected items for the prior year. If the differences were sufficiently large to trigger an edit flag, institutions were contacted for further verification.

Part B: Enrollment, by Age
Part B data were edited in a similar manner. Addition checks were performed by comparing reported totals in Part B to corresponding totals in

Part A. Differences between the totals were calculated and balances containing the differences were generated. If the balance was outside a certain range, the institution was contacted for verification/correction. If the balance was within a certain range, the Part B total was replaced by the corresponding total from Part A. The balance was then allocated among the age categories using the institution's reported age distribution.

## Data Management and Imputation

The response rate for institutions was approximately 97 percent, and these institutions accounted for more than 99 percent of enrollment. Because the response rate was so high for the enrollment data, a very straightforward process was followed for imputation. For nonreporting institutions, data from the institution's prior 1998 Part A response was used as the imputation for fall 1999. In some cases, the prior response was also an imputation. Because of the extremely high representation of the larger institutions in all major sectors of degree-granting institutions, any bias caused by this procedure was considered to be minimal.

Data for Part B was imputed by using the distribution from the 1997 enrollment by age survey, and using that age distribution for each institution to distribute their (reported or imputed) fall 1999 enrollment by age.

## Raking of Data

When data were reported by racial/ethnic categories on a detail line and the generated sum of these enrollments did not equal the reported total enrollment, the difference between the generated total and the reported total was calculated. If the difference exceeded a certain designated range, the institution was contacted for correction. If the difference was within the designated range, a "balance column" was created. The balance column as well as the "race unknown" column was then distributed in the same proportions as the reported racial/ethnic data for that detail line. When the racial/ethnic numbers were adjusted to full counts, there were often lines that failed add checks because of rounding. The largest figure in each row was adjusted by one or two, so that the line added to the original reported total for that line.
