Young Adults Neither Enrolled in School nor Working

The percentage of 18- to 24-year-olds neither enrolled in school nor working decreased from 19 percent in 2010 to 13 percent in 2019, the year before the coronavirus pandemic started to disrupt American society. The percentage then increased, reaching 16 percent in 2021.

Education and work are core activities in the transition from childhood to adulthood. Young adults who are detached from these activities, particularly if they are detached for several years, may have difficulty building a work history that contributes to future employability and higher wages. Young adults who are neither enrolled in school nor working may be detached from these activities for a variety of reasons. For example, they may be seeking educational opportunities or work but are unable to find them, or they may have left school or the workforce temporarily or permanently for personal, family, or financial reasons. Using data collected in the March supplement of the Current Population Survey (CPS), this indicator examines the rate at which 18- to 24-year-olds are neither enrolled in school nor working.

Figure 1. Percentage of 18- to 24-year-olds who were neither enrolled in school nor working, by age group: 2010 through 2021

In 2021, some 16 percent of 18- to 24-year-olds were neither enrolled in school nor working. This percentage was higher for 20- to 24-year-olds (18 percent) than for 18- and 19-year-olds (13 percent).

The percentage of 18- to 24-year-olds who were neither enrolled in school nor working decreased from 19 percent in 2010, the year immediately after the 2007-2009 recession, to 16 percent in 2021. Within this time period, this percentage reached a low of 13 percent in 2019, the year before the coronavirus pandemic started to disrupt American society. Since 2019, the percentage who were neither enrolled in school nor working increased, reaching 16 percent in 2021.
In 2021, the percentage of 18- to 24-year-olds who were neither enrolled in school nor working varied by race/ethnicity. The percentage who were neither enrolled in school nor working was higher for those who were American Indian/Alaska Native (31 percent), Black (23 percent), and Hispanic (18 percent) than for those who were White (15 percent), of Two or more races (12 percent), and Asian (10 percent). In addition, this percentage was higher for those who were Pacific Islander (22 percent) and White than for those who were Asian.
The percentage of 18- to 24-year-olds who were neither enrolled in school nor working in 2021 was not measurably different for males than for females overall (17 vs. 16 percent). This percentage was also not measurably different between males and females for any of the racial/ethnic subgroups.4
Figure 4. Percentage of 20- to 24-year-olds who were neither enrolled in school nor working, by sex, race/ethnicity, and high school completion status: 2021

In 2021, the percentage of 20- to 24-year-olds who were neither enrolled in school nor working was higher for those who had not completed high school (37 percent) than for those who had completed high school (16 percent). These differences by high school completion status were also observed for males and females and for racial/ethnic groups for whom data were available (White, Black, and Hispanic). However, the gap by high school completion status was narrower for males (15 percentage points) than for females (28 percentage points) and narrower for those who were Hispanic (14 percentage points) than for those who were White (28 percentage points).
Young Adults Neither Enrolled in School nor Working

Endnotes:
4 This comparison was not made for 18- to 24-year-olds who were Pacific Islander because their male estimate did not meet reporting standards.
5 The narrower 20- to 24-year-old range was chosen to reduce the number of high school students in this analysis.
6 High school completion includes those persons who graduated from high school with a diploma as well as completion of high school through equivalency programs, such as a GED program.
