Highlights

The essay presented in this report used data from the National Education Longitudinal Study of 1988 eighth graders to examine postsecondary access and choice issues confronted by this nationally representative cohort in both 1992 (as high school seniors) and in 1994 (two years out of high school). The analysis focuses on potential barriers to access and choice as experienced by women, racial and ethnic minorities, and those in lower socioeconomic groups. Special attention was paid to students who scored in the highest quartile of the 1992 math and reading test composite.

- Nearly 63 percent of 1988 eighth graders had attended some type of postsecondary education by 1994 (Table 6A). Of those attending postsecondary education, about 57 percent matriculated at public or private four-year colleges or universities; 36 percent enrolled in public two-year institutions; and the remainder (7 percent) attended trade or technical programs of shorter duration (Table 10A).
- In 1988, 66 percent of the 1988 eighth graders who participated in both the 1988 and 1992 surveys expressed the expectation of attaining at least a bachelor's degree, and an additional 22 percent expected to obtain some postsecondary education (Table 1).
- There was a five percent decline between 1988 and 1992, from 66 percent to 61 percent, in the percentage of the 1988 eighth grade cohort expecting to attain a bachelor's degree or higher (Table 1).
- High school transcripts for this cohort indicate that approximately 62 percent of the cohort pursued programs that would constitute college preparation; 38 percent were enrolled in general or vocational tracks (Table 2A).
- By 1994, 81 percent of 1988 eighth graders had received a regular high school diploma. Another 6 percent had earned a GED certificate (Table 3A).
- By the spring of 1992, about 40 percent of 1988 eighth graders had not submitted any postsecondary applications; of those who had applied, 88 percent had completed at least two applications (Table 5A).
- Almost three-fourths of 1988 eighth graders who enrolled in four-year institutions attended them in their home state (Table 16A).
- Approximately 71 percent of cohort members who attended a four-year institution indicated that the college or university they attended represented their first or second choice (Table 17A).
- Over 96 percent of 1988 eighth graders who attended four-year institutions were enrolled full-time (Table 18A).

- A greater percentage of females than males in the 1988 eighth grade cohort reported in 1992 that they expected to obtain a bachelor's or higher degree (Table 1). In choosing a college, a greater percentage of women than men reported being concerned about the institution's reputation (Table 11A) and about the crime rate (Table 15A).
- Greater percentages of Asians or Pacific Islanders in the cohort reported expectations for a bachelor's or higher degree (Table 1), had graduated from high school by 1994 (Table 3A), and had enrolled in postsecondary education by 1994 than any other racial/ethnic group (Table 6A). Hispanics who were in the eighth grade in 1988 were more inclined than any other racial/ethnic group to enroll in public two-year institutions (Table 10A). Blacks in this cohort enrolled in private four-year institutions at rates comparable to Asians and whites (Table 10A).
- There were no significant differences by sex or race/ethnicity in the access and choice variables for 1988 eighth grade cohort members who scored in the highest quartile in the 1992 achievement test. However, respondents in the highest socioeconomic status quartile had a higher rate of expectation for a bachelor's or higher degree (Table 1), a higher graduation rate (Table 3B), a greater percentage reporting filing two or more postsecondary applications by 1992 (Table 5B), and a smaller percentage delaying entry (Table 10B).

Foreword

This report describes the 1994 postsecondary education attendance patterns, job experiences, lifestyles, and values of the eighth grade class of 1988. The data from the report are from the 1994 Third Follow-up of the National Education Longitudinal Study of 1988 eighth graders (NELS:88/94). NELS:88/94 collected information on postsecondary education participation, employment, earnings, family formation, and other activities and experiences relevant to individuals as they are about to enter their adult lives.

NELS:88/94 contains information that represents several nationally representative samples, including 1988 eighth graders, 1990 tenth graders, and 1992 twelfth graders enrolled in public or private schools. By the time of the 1994 follow-up study most NELS:88 sample members had completed four years of high school. However, some had dropped out of high school or had attended alternative programs to complete their diploma. (A more complete description of the NELS:88 sample can be found in Appendix A of this report.)

The first section of this report is an essay that examines the postsecondary education *access* and *choice* of the 1988 eighth grade cohort. Access to postsecondary education is defined in terms of factors related to enrollment into a postsecondary institution. Student-level factors, such as their expectations and their academic preparation, may combine with background characteristics, and with life circumstances, to facilitate or inhibit enrollment. The meaning of postsecondary educational choice covers the type of institution attended, whether it was a "first-choice" institution, the level of intensity (full or part time), and location, among other things. Access and choice are examined differentially by sex, race, socioeconomic status, and tested achievement.

The second part of the report consists of sets of tables which present other information about the education, jobs, and life experiences of the 1988 eighth grade cohort. The tables are organized into four sections: Postsecondary Education Expectations and Experiences, Labor Force Participation, Family and Financial Circumstances, and Values, Other Activities, and Civic Participation. As in the essay, these experiences are examined for young people with different types of high school experiences and backgrounds.

The results presented in this report were produced using the NELS:88/94 Data Analysis System (DAS). The DAS is a microcomputer-based program that allows users to create these and other tables from the NELS:88 data. The DAS produces survey design-adjusted standard errors appropriate for testing the statistical significance of differences between the groups shown in the tables. Additional information about the NELS:88/94 DAS, including how it may be obtained, is presented in Appendix A of this report.

We hope that the information provided in this report will be useful to a wide range of interested readers. We also hope that the results reported here will encourage others to use the NELS:88/94 data. We welcome recommendations for improving the format, content, and analytic approach, so that future descriptive reports will be more informative and useful.

Paul D. Planchon
Associate Commissioner

Acknowledgments

The authors express their sincere thanks to all those who contributed to the production of this report. First and foremost, we acknowledge the expertise of the NELS:88/94 Technical Review Panel (TRP), whose insights guided this study from its very beginning through the completion of this report. C. Dennis Carroll and Marilyn M. McMillen at the National Center for Education Statistics (NCES) reviewed early drafts of the report and offered many useful suggestions for its improvement. Panel members from the Department of Education were Nabeel Alsalam, who suggested the report format, and to whom we are particularly grateful; Cliff Adelman; David Bergeron; and Dan Goldenberg. Other panel members were Jay Noel of the Congressional Budget Office, Jomills Braddock of the University of Miami, Vincent Tinto of Syracuse University, Jerry Bachman of the University of Michigan, Nancy Karweit of Johns Hopkins University, Marta Tienda of the University of Chicago, Eric Hanushek of the University of Rochester, and consultant Laura Knapp. The authors would especially like to thank the members of the adjudication panel for their careful reading and thoughtful comment. Members of the panel were Jeffrey Owings, Nabeel Alsalam, Sal Corrallo, Dan Goldenberg, David Bergeron, and Jerry Bachman.

At NORC, Norman Bradburn, Steven Ingels, Paul Buckley, and Howard Speizer provided substantive and technical review. Michael Fleischer produced tables, statistical tests, and highlights for the table compendium. Dennis Dew, Whitney Moore, Kate Baldwin, Yi Li, and Rebecca Thomson assisted in the production of tables and statistical tests for the report. Karen Rosenthal, assisted by Suzanne Erfurth, provided editorial review and assisted greatly in the preparation of the Glossary.

2-6	Percentage of 1988 eighth graders with different 1993 postsecondary education attendance and employment statuses, by selected secondary and postsecondary education characteristics	62
2-7	Percentage of 1988 eighth graders employed in 1993 reporting different fringe benefits received from held job in 1993, by selected background characteristics	64
2-8	Percentage of 1988 eighth graders employed in 1993 receiving employer-provided tuition assistance and job training benefits in 1993, by selected background characteristics	66
2-9	Average number of weeks attended, and average hours per week, by 1988 eighth graders employed in 1993 in job-related training in 1993, by selected background characteristics	67
2-10	Percentage of 1988 eighth graders employed in 1993 reporting they are very satisfied with various employment conditions and benefits from longest held job in 1993, by selected background characteristics	68
2-11	Percentage of 1988 eighth graders reporting in 1994 their expectations to be in different occupations by age 30, by various background characteristics	70
2-12	Percentage of 1988 eighth graders reporting in 1994 their expectations to be in different occupations by age 30, by selected secondary education characteristics . . .	71
2-13	Average of 1988 eighth graders' reports in 1994 of expected income at age 30, by selected characteristics	72
2-14	Average of 1988 eighth graders' reports in 1994 of expected income at age 30, by selected secondary education characteristics	73
3-1	Percentage of 1988 eighth graders by timing of first sexual intercourse, by selected background characteristics	77
3-2	Percentage of 1988 eighth graders by timing of first sexual intercourse, by selected secondary education and labor force characteristics	78
3-3	Percentage of 1988 eighth graders reporting in 1994 that they used birth control during their first sexual intercourse, by selected background characteristics	79
3-4	Percentage of 1988 eighth graders reporting in 1994 that they used birth control during their first sexual intercourse, by selected secondary education and labor force characteristics	80

List of Tables (Cont'd)

3-5	Percentage of 1988 eighth graders not married in 1994 who reported that they used birth control during their last sexual intercourse, by selected background characteristics	81
3-6	Percentage of 1988 eighth graders not married in 1994 who reported that they used birth control during their last sexual intercourse, by selected secondary education and labor force characteristics	82
3-7	Percentage of 1988 eighth graders by marital status in 1994, by selected background characteristics	85
3-8	Percentage of 1988 eighth graders by marital status in 1994, by selected secondary education characteristics	86
3-9	Percentage of 1988 eighth graders with none, one, or two or more children by 1994, by selected background characteristics	87
3-10	Percentage of 1988 eighth graders with none, one, or two or more children by 1994, by selected secondary education characteristics	88
3-11	Percentage of 1988 eighth graders with oldest children of different ages by 1994, by selected background characteristics	89
3-12	Percentage of 1988 eighth graders with oldest children of different ages by 1994, by selected secondary and postsecondary education characteristics	90
3-13	Percentage of 1988 eighth graders reporting in 1994 contributing to dependents' support, and average yearly amounts contributed to dependents' support, by selected background characteristics	91
4-1	Percentage of 1988 eighth graders reporting in 1994 that various values are "very important," by selected background, secondary education, and postsecondary education characteristics	94
4-2	Percentage of 1988 eighth graders participating in 1994 in various activities at least once a week on average, by selected demographic, secondary education, and postsecondary education characteristics	96
4-3	Percentage of 1988 eighth graders reporting in 1994 the number of organizations to which they volunteered time, by selected demographic, secondary education, and postsecondary education characteristics	98
4-4	Percentage of 1988 eighth graders who, in 1994, were registered to vote, voted in the 1992 presidential election, and voted in the last local election, by selected demographic, secondary education, and postsecondary education characteristics . . .	100

Introduction

This essay uses the data from the National Education Longitudinal Study, Third Follow-up (NELS:88/94), to study access and choice issues related to postsecondary educational experiences of a national sample of young Americans who were eighth graders in 1988. Most of these young people are now leaving their teenage years and are engaged in independent decision-making and adult experiences in areas such as marriage and parenting, postsecondary education alternatives, and labor market searches and employment. Acquiring additional training and/or continuing formal study beyond high school are important objectives for many people in their twenties. Thus, this summary report focuses on two fundamental postsecondary education issues--access and choice--during the initial two-year period after high school.

Postsecondary education in the United States entails considerable heterogeneity and flexibility. Although curricular differences certainly exist in elementary and secondary education, they are relatively minor in comparison with the postsecondary landscape (i.e., institutional type, the type and length of certificate and degree programs, and so forth). Furthermore, whereas legislation requires nearly universal participation for all children under age 16, participation in postsecondary education is voluntary.<1> Finally, while students progress through elementary and secondary school in a more or less regular fashion, progressions in postsecondary education do not have this same inherent regularity.

The factors affecting participation in elementary and, to some degree, secondary education result in education systems that mirror the nation's population. In the absence of these forces, however, the postsecondary education system is highly subject to individual preferences, decisions, opportunities, and constraints. The consequences can be both positive and negative. On the positive side, individual choices may result in a closer match between predilections, abilities, and goals on the one hand, and postsecondary educational decisions concerning participation, curriculum, intensity, and timing on the other. On the negative side, constraints may lead to lost opportunities as well as social or economic inequities.

The analyses that follow document the experiences of and effects on various economic, social and ethnic groups as they participate in and navigate through the heterogeneity in American postsecondary education. As noted above, there is enormous diversity by type and length of program, intensity of enrollment (i.e., full- vs. part-time), institutional size and control, and the relative cost of postsecondary education alternatives. There may not be the full diversity or representation of the American population in postsecondary education, however, if significant barriers to access and choice exist. This could occur through deliberate means as when some state postsecondary education systems restrict access (and distribute students) on the basis of high school performance. It could also occur implicitly, such as when students and their parents consider their options and constraints in making postsecondary enrollment decisions, and limit their participation to ways that they would otherwise consider less desirable. (Of course, some inequalities in the enrollment distribution by, say, gender could occur across institutions or programs as the result of individual student preferences, and thus are not the result of access or choice barriers.)

The National Educational Longitudinal Study (NELS:88) has to date collected for 1988 eighth grade cohort members data that bracket an individual's life, from approximately ages 14 to

20. Cohort members were surveyed in 1988, 1990, 1992, and 1994. This period encompasses years in which lifestyle expectations are formed and perhaps cemented, information on many fronts is gathered and assessed, and important decision making, some of which includes or at least affects postsecondary education, occurs. The 1988 to 1994 time period covered by NELS:88 is also marked by important continuing trends in American labor markets and higher education, environments into which most members of the 1988 eighth grade cohort have just entered. These include the increasing tendency of individuals to mix work and learning by holding jobs while continuing their formal education, as well as contemporary educational paths that entail interruptions and adjustments rather than continuous, seamless enrollment patterns. The rising premium on skills and college degrees, the widening inequality of earnings across skill levels, and the increasing net financial burden on those who seek college degrees (as tuition levels continue to rise and financial aid programs shift from grants to loans) represent additional personal and societal concerns. NELS:88/94 data represent a rich source of information which can shed light on obstacles to and opportunities to participate in postsecondary education as seen by those who were in the eighth grade in the United States in 1988.

Access to postsecondary education can be affected by many factors. Students' academic aspirations or expectations, the quality and level of their preparation, and their achievements are cardinal influences. Personal considerations, such as peer influences, family background, and lifestyle choices may also affect postsecondary enrollment decisions. Through providing descriptive information about access in tables and accompanying narrative, this report addresses many of these issues. The tables explicitly examine factors influencing postsecondary education decisions by sex, race/ethnicity, socioeconomic status, and tested achievement.

Throughout the document, special attention will be paid to students who scored in the highest quartile of the composite of the math and reading cognitive tests administered in NELS:88/92 (the Second Follow-up). Obstacles to access, if they exist at all, should be less severe for these students, a group which has demonstrated its intellectual readiness for postsecondary education. The presence of obstacles to access here may be cause to evaluate education policy in light of meritocratic principles. The other focus will be those who enroll in public and private four-year institutions.

Choice and access are related to each other in the sense that access factors may limit choices. Beyond this, choice is related to such considerations as institution or program type, the timing and intensity of enrollment, and other institutional characteristics, such as its location, reputation, size, cost, and social environment. As with the discussion of access, the narrative summaries and tabular displays discuss choice in the context of sex, race/ethnicity, socioeconomic status, and tested achievement.

There are, to be sure, other dimensions of access and choice. These would include: nontraditional enrollments, remedial course-taking, training and retraining opportunities, and life-long learning (i.e., adult continuing education). Although important in and of themselves, these areas are beyond the scope of this essay.

Access

Educational aspirations and expectations, perhaps formed fairly early in life, are certainly key factors influencing access. They are, in turn, undoubtedly influenced by academic benchmarks such as achievement levels in elementary and secondary school, the type of secondary education program followed, and persistence through high school to awarding of the diploma.

Other important determinants of access arise from circumstances over which the student has had little or no control. Among these are one's background, which includes family structure as well as the expectations parents have for their children, available role models, educational opportunities, and perhaps even health.<2> In addition, lifestyle choices, such as whether and when to get married and start a family (as well as some forms of pro-social or anti-social behavior), affect postsecondary educational opportunities and decisions. Finally, because postsecondary education must start with the application and enrollment process, the failure to take these steps, for whatever reasons, can be viewed as obstacles to postsecondary access.

Educational expectations. Early goals and images of ability level and opportunities may affect achievement throughout life. The NELS:88 data contain reports of the highest level of education students expected to attain, collected while cohort members were in the eighth grade and then four years later.

As early as eighth grade, almost two-thirds of the NELS:88 eighth grade cohort expected to attain a bachelor's degree or higher, and an additional 22 percent expected to obtain some postsecondary education.<3> There was an overall decline between 1988 and 1992 in the percentage who expected to earn a bachelor's or higher degree (Table 1). This may reflect more realism and knowledge acquired during this four-year interim as students assess their own interests and abilities, learn more about the availability and costs of postsecondary alternatives, consider other life-style choices such as marriage, gain some employment experience, and become more aware of the potential gains from a college or advanced degree.

Considering 1992 expectations, a greater percentage of women than men, and a greater percentage of Asians than other racial/ethnic groups, reported that they expected to obtain at least a baccalaureate degree. Also, a lower percentage of Hispanic 1988 eighth graders than whites expected to earn a bachelor's degree or higher. As one moves up the socioeconomic ladder there is a pronounced increase in the percentage of 1988 eighth graders who expected in 1992 to earn at least a bachelor's degree, from 36 percent in the lowest socioeconomic quartile to 86 percent in the highest quartile. In addition, as tested achievement increases so does the percentage of cohort members with expectations for a bachelor's or higher degree: Approximately 92 percent of those in the highest test quartile in 1992 expected to complete college and/or additional postgraduate work (Table 1). Students in this latter group have likely done well in high school, and thus have probably received more positive feedback and encouragement with respect to continuing their formal learning.<4>

Table 1 Percentage of 1988 eighth graders indicating in 1988 and 1992 the highest level of education they expect to obtain, by selected background characteristics

	Year	Less than high school diploma	High school graduate	Some college or vocational school	Bachelor's degree or more

Note: Rows may not sum to 100 percent due to rounding. The estimates in this table include those who dropped out of school between eighth and twelfth grade.

Academic preparation. Access to various postsecondary education options in general, and to four-year colleges and universities in particular, is affected first and foremost by academic preparation. Nearly 62 percent of all 1988 eighth graders reported being enrolled in a high school academic/college preparatory track in 1992; 38 percent were enrolled in a general or vocational program (Table 2A).^{<5>} A significantly higher percentage of females than males were in academic/college preparatory programs. Asians had significantly higher percent representation in high school academic programs than any other racial/ethnic group except whites. Blacks and Hispanics showed lower representations than the other two racial/ethnic groups (but with no significant differences between blacks and Hispanics). Those in the middle and highest socioeconomic and test quartiles participated in academic programs in greater percentages (Table 2A).

Among the 1988 eighth graders in the highest 1992 test quartile, only 13 percent were enrolled in vocational or general study programs in high school. In contrast to observations about the entire cohort above, there were no differences in academic program participation by sex, race/ethnicity, or socioeconomic status (Table 2B).

For the vast majority of students, attaining a high school diploma is a necessary, but not sufficient, condition for the successful attainment of a bachelor's or advanced degree. Also important are the particular high school courses taken and the level of achievement attained in them. By 1994, 81 percent of those who were eighth graders in 1988 had received a regular high school diploma, 6 percent had received a GED certificate, 0.4 percent reported that they were still working toward a high school diploma, and 5 percent were working toward a GED or certificate (Table 3A). The remainder, 7.2 percent, reported not having earned a diploma or certificate and were not continuing to pursue one.^{<6>}

Asians were graduated at a rate higher than the other racial/ethnic subgroups, and whites had statistically higher rates than blacks or Hispanics. High school graduation rates vary directly by socioeconomic and test quartile. In the highest test quartile, almost all students had earned diplomas (Table 3B).

Academic performance. Achievement in mathematics and reading, as measured by scores on the NELS:88/92 Second Follow-up cognitive test score composite, was used in this report as a proxy for college readiness.<7> Those in the highest test quartile are a subgroup that should have experienced the fewest academic access barriers. Consistent with educational expectations, type of high school program pursued, and high school diploma status, a significantly smaller percentage of women than men scored in the lowest test quartile, and significantly more women than men scored in the middle two quartiles. There was no observed difference between men and women in the highest quartile (Table 4).

The NELS:88 data do show differences, however, across test quartiles by racial/ethnic groupings and socioeconomic status. A higher percentage of Asians and whites than blacks and Hispanics in the 1988 eighth grade cohort fall into the highest test quartile. Furthermore, a significantly higher percentage of Hispanics than blacks scored in the highest test quartile. About six percent of students from the lowest socioeconomic quartile scored in the highest test quartile, while about half of those in the highest socioeconomic quartile did so; conversely, 44 percent of students in the lowest socioeconomic group also fell into the lowest test quartile while only 7.5 percent of those in the highest socioeconomic quartile did.

Applications. As noted above (Table 3A), 81 percent of 1988 eighth graders had earned a regular high school diploma by 1994 (the Third Follow-up). In the vast majority of cases this would have occurred soon after the Second Follow-up survey in 1992. In 1992, 61 percent of the eighth grade cohort expressed the expectation of obtaining at least a bachelor's degree, and an additional 28 percent expected to obtain some postsecondary education (Table 1). However, by spring of 1992 (i.e., the senior year in high school for most of these students), 40 percent of the 1988 eighth graders had not submitted a completed postsecondary application (Table 5A). This group should include at least three categories: those who fully intend to apply at some point but are delaying entry, those who intend to enroll sometime in 1992 and will apply after high school (such as to local community colleges that have multiple, as well as more flexible, application deadlines), and those who currently do not intend to enroll in postsecondary education.

Of those who had applied to a postsecondary institution by 1992, about 12 percent reported applying to only one institution, while almost 88 percent who had applied to a postsecondary institution reported completing at least two applications (Table 5A). There was considerable variation by sex, race/ethnicity, socioeconomic status and tested ability in the application process.

A significantly greater percentage of males than females failed to file an application by the 1992 survey date, while a significantly greater percentage of females than males had filed two or more applications by that date. A higher percentage of Asians and whites than blacks and Hispanics filed at least one postsecondary application. A greater percentage of Asians also reported filing multiple applications than did any group except whites. Blacks and Hispanics did not differ from each other with regard to filing no applications.

More than twice the percentage of 1988 eighth graders in the lowest socioeconomic quartile did not file an application in comparison to those in the highest socioeconomic quartile. Furthermore, those in the lowest test quartile had nearly four times the percentage of non-filers compared to those in the highest test quartile. At the other end of the spectrum, over three-fourths of those in the highest socioeconomic quartile and 85 percent of cohort members in the highest test quartile filed two or more applications while only 31 and 29 percent in the lowest socioeconomic and test quartiles, respectively, did so (Table 5A).<8>

Whereas for the 1988 eighth grade population as a whole, 40 percent had not filed a postsecondary application by spring of 1992, within the highest tested achievement quartile only 15 percent had not done so (Table 5B). Inasmuch as virtually all of this group, at the same point in time, expressed the expectation of extending their formal learning beyond high school, and most of that in a baccalaureate institution (92 percent), it would be reasonable to assume that this 15 percent figure represents delayed entry rather than withdrawal. If this is a valid assumption, delay may be more pronounced among the lower socioeconomic quartiles and for Hispanics in comparison to Asians and whites. (Hispanics, even when they do apply and enroll, attend two-year community-college programs in significantly greater percentages--see below.)

Participation. Overall, about 63 percent of the NELS:88 eighth grade cohort had attended some form of postsecondary education by 1994. In general, enrollment patterns followed those for applications. A greater percentage of women than men reported attending at least one postsecondary institution.<9> In the overall 1988 eighth grade respondent population, Asians showed the greatest percentage having attended a postsecondary educational institution compared to all other racial/ethnic groups. Blacks and Hispanics had lower enrollment rates than Asians or whites.

Sizable differences were also found for test and socioeconomic groupings; a greater percentage of 1988 eighth graders in the highest and middle two socioeconomic quartiles (88 percent and 63 percent, respectively) reported attending at least one postsecondary institution, whereas among those in the lowest quartile only 36 percent reported doing so. The enrollment percentage was much higher (92.7 percent) for those in the highest test quartile than in the middle two quartiles (69.3 percent) or in the lowest quartile (38.6 percent). Furthermore, a greater percentage of those in the middle test quartile than those in the lowest quartile reported having attended a postsecondary institution by 1994 (Table 6A).

Similar differences in enrollment patterns as those noted above also occurred by sex among cohort members in the highest test quartile. No significant differences in postsecondary attendance by race/ethnicity were observed for the highest test quartile (Table 6B).

Background and individual decision making

Academic considerations, such as high school preparation, performance and persistence, can certainly affect one's readiness for and access to (and, of course, success in) postsecondary education. However, family background and personal choices can also be important influences and/or determinants. We now turn to three of these issues: at-risk factors, marriage, and parenting.

At-risk of school failure. The NELS:88/94 data contain information on 1988 eighth graders who were identified as "at risk" of dropping out of high school based on background and family circumstances present while in eighth grade.<10> The factors constituting risk were whether the student lived in a single-parent family, was from a family with an annual income of less than \$15,000, had an older sibling who had dropped out of school, had parents who did not finish high school, had limited proficiency in English, and/or was at home without adult supervision more than three hours a day. Overall, 55 percent of NELS:88 participants showed no at-risk factors, 25 percent had one, and almost one-fifth, 19 percent, had two or more (Table 7A). Eighth graders with two or more of these factors present may experience a substantial barrier to postsecondary education participation and success.<11>

While the presence of two or more risk factors appears to be independent of gender, it is not independent of race/ethnicity or tested achievement. (Differences in the number of risk factors are not examined by socioeconomic status because family income and parent's education, two components of socioeconomic status, are also components of the "at-risk" variable. Thus, the number of risk factors is related to socioeconomic status, which would result in artificially inflated differences in risk factors for the different socioeconomic status groups.) A smaller percentage of Asians and whites, in comparison to blacks and Hispanics, had two or more risk factors (Table 7A). Eighth-grade risk factors are strongly associated with 1992 tested achievement, indicating a justification for concern that these factors affect students' learning opportunities. More than three-fourths of those in the highest test quartile had no risk factors, while only about half that percentage (37 percent) in the lowest test quartile had no risk factors. By contrast, only 5 percent of high tested achievement students had two or more risk factors, as did 16 percent of those in the middle two test quartiles and nearly one-third of those in the lowest test quartile (Table 7B).<12>

Marriage and family formation. For purposes of postsecondary education decisions, which include attendance, intensity of enrollment, and financing of studies, it is unclear whether people in “marriage-like” relationships, who constituted 7 percent of 1988 eighth graders overall in 1994, behave more like single or married respondents (Table 8A). The number of divorced, separated, or widowed respondents is too small to draw conclusions about these members of the cohort. Consequently, married and single, never married cohort members constitute the focus of this discussion.

With regard to access and choice in postsecondary education, the impact of marriage by itself, without taking children in the household or other factors into consideration, is ambiguous. For example, marriage may provide financial support if one spouse is enrolled in a postsecondary institution and the other is employed, as well as providing stability, maturity, purpose, and other generally accepted positive byproducts. On the other hand, marriage can bring financial pressures. These, in turn, could affect the timing of participation in postsecondary education (i.e., delayed entry), a preference for part-time enrollment coupled with employment rather than full-time student status, and perhaps even a tendency to attend an institution or program closer to home.

Most 1988 eighth graders (83 percent), most of whom were about twenty years old, had never been married by 1994 (Table 8A). Higher reported marriage rates for 1988 eighth grade women is consistent with known tendencies for men to marry at a later age and for husbands to be several years older than their wives. Thus some women in the NELS:88 survey are married to men who are older than twenty and are therefore not in the 1988 eighth grade cohort. In every category less than fifteen percent of the population reported being married. The percent married decreases as one moves up socioeconomic and test quartiles.

A greater percentage of those in the highest test quartile group reported never having been married by 1994 (94 percent). Within the 1992 high tested achievement quartile there are no significant differences in reported marriage rates by race/ethnicity or socioeconomic status. However, those in the lowest and middle two socioeconomic quartiles have significantly lower rates of remaining single than those in the highest quartile (Table 8B).<13>

Unlike marriage, where there can be counterbalancing or offsetting forces as noted above, the presence of young children most likely constitutes a financial burden for the NELS:88 cohort member. This would in turn be expected to reduce immediate postsecondary education participation, or certainly limit it to part-time enrollments. Overall, approximately 16 percent of 1988 eighth graders reported having at least one child. The percentages of Asian and white 1988 eighth graders with children by 1994 were lower than for Hispanics or blacks (Table 9A).

When grouped by test quartiles, the percentage of 1988 eighth graders reporting no children varied inversely with tested achievement, and within the highest test quartile there were no reported differences by race/ethnicity. However, a greater proportion of those who were also in the highest socioeconomic quartile reported having no children than did those in the other two socioeconomic groupings (Table 9B).

Table 8A Percentage of 1988 eighth graders reporting their marital status as of 1994, by various characteristics

	Single never married	Married	Divorced or separated or widowed	In marriage-like relationship

Choice

The American postsecondary education system is very diverse, and, taken as a whole, presents opportunities to those with any predilection and from virtually all walks of life. A young person just out of high school who contemplates the full range of possibilities might find the options overwhelming. However, choices are shaped by, among other things, abilities, interests, social influences, societal expectations, group membership, and resource limitations. These influences and constraints may reduce the decision task to a more tractable and comfortable set of alternatives. But in some ways they could also impose tight limits.

This section examines postsecondary education decisions made by the NELS:88 cohort members by 1994. Four factors are discussed: the choice of institutional type and sector, the influences of social and financial concerns, the role of institutional location, and the intensity of enrollment. These factors are considered for all 1988 eighth graders with postsecondary enrollment by 1994 and for that portion of this population who were in the highest cognitive test quartile in 1992. The population of 1988 eighth graders attending baccalaureate institutions by 1994 constitutes an additional focus in this section.

Choice of institution type and sector. One of the most important decisions a young person aspiring to postsecondary education must make is which type of institution to attend. This decision is affected by many factors, such as academic performance in high school, family background and parental influences, and the student's own career goals. Of course, financial and life circumstances also play a role.

About five percent of 1988 eighth graders with postsecondary enrollment by 1994 reported attending a private-for-profit institution, about two percent reported attending private not-for-profit institutions, and nearly one percent reported attending public less-than-two-year institutions (Table 10A). These three types of postsecondary institutions are most likely trade or technical programs. Thirty-six percent enrolled in community colleges (public two-year institutions), 38 percent matriculated at public four-year institutions, and 19 percent reported attending private four-year colleges or universities (Table 10A). A comparison of attendance rates for the three most frequently attended types of postsecondary institutions revealed a number of differences. Almost 50 percent of Hispanics first enrolled in community colleges; a smaller percentage of Hispanics than Asians, blacks, or whites enrolled in private not-for-profit four-year institutions. Blacks enrolled in private four-year institutions at rates comparable to Asians and whites. For four-year public institutions, a lower percentage of Hispanics were enrolled than whites. No other race/ethnicity differences were significant for four-year public institutions.

A higher percentage of 1988 eighth graders with postsecondary enrollment by 1994 from higher socioeconomic status and test quartiles enrolled in private four-year institutions. Attendance at public four-year schools is also associated with socioeconomic status and tested achievement. Furthermore, those in the lowest groupings on socioeconomic status and tested achievement reported a higher percentage of enrollments at public two-year institutions than did those in the middle and highest quartiles (Table 10A).

Of the 1988 eighth graders who were in the highest test quartile in 1992 and had attended a postsecondary institution by 1994, 82 percent enrolled in either a public or private not-

for-profit four-year institution. In contrast to the entire population of 1988 eighth graders attending postsecondary institutions by 1994, there were no significant differences by sex, race/ethnicity, or socioeconomic status with regard to enrollment in public four-year institutions by those in the highest 1992 test quartile. For enrollment in private four-year institutions by high test quartile students, there were no observed differences by sex or race/ethnicity, but there were differences by socioeconomic status: A higher percentage of 1992 high test quartile students in the highest socioeconomic quartile than in the mid or low socioeconomic quartiles attended private four-year colleges and universities. However, while a greater percentage of Hispanics overall first enrolled at public two-year institutions, this difference was no longer significant for Hispanics in the highest test quartile (Table 10B).

Enrollment in four-year postsecondary institutions. Overall, 57 percent of the NELS:88 eighth grade cohort members who had attended a postsecondary institution by 1994 were in a four-year college or university (Table 10A). Furthermore, most of those in the highest test quartile who had enrolled also chose a public or private four-year institution (Table 10B). For these reasons, the remainder of this essay will limit tables and analyses to those individuals who chose this type of postsecondary alternative.

There are many possible considerations that influence a student's choice of four-year postsecondary institution, including the availability of courses and awarding of degrees in the student's preferred field of study, as well as the institution's track record for placing its graduates in jobs or graduate/professional programs. Other considerations might include athletic programs, where one's parents went to college, the social environment, racial composition of the student body, and total enrollment at the institution. In light of considerations reported by 1988 eighth graders as very important in the Second Follow-up (1992), five variables were isolated for analysis: (1) the institution's reputation, (2) the expected expenses, (3) the availability of financial aid, (4) the option of living at home (which could include both financial benefits and more family support), and (5) the crime rate at or around the institution.

Overall, 64 percent of those enrolled in baccalaureate-granting colleges and universities indicated in 1992 that the institution's reputation was a very important factor in their enrollment decision. Across all sex, racial/ethnic, socioeconomic and tested achievement categories, the majority of 1988 eighth graders listed this factor as very important (Tables 11A and 11B). A higher percentage of women than men said that the reputation of the institution was a very important consideration, as did a higher percentage of those in the highest test quartile.

Only 24 percent of 1988 eighth graders indicated that the level of college expenses was very important in their decision as to where to enroll, and 44 percent indicated that the availability of financial aid was also very important (Tables 12A, 12B, 13A and 13B). Thus it appears that students may regard college expenses (including tuition, which is not shown separately) in tandem with financial aid.<14> A higher percentage of women than men, of blacks than Asians, whites, or Hispanics, of Hispanics than whites, and of those in the lowest socioeconomic and test quartiles indicated that the level of college expenses was a very important consideration. With regard to the availability of financial aid, the same pattern of differences was observed for sex, and race/ethnicity, except that Hispanics also had a significantly higher percentage than Asians, and blacks also had a significantly higher percentage than Hispanics, reporting that the availability of financial aid was a very important consideration. Among those in the highest tested achievement quartile, a greater percentage of women than men, of black students compared to all other racial/ethnic groups, and of those in the lowest socioeconomic quartile reported that financial aid was an important consideration.

An institution's location, whether it be urban versus rural, or close to one's home and family versus far from them, can be a criterion upon which students base an enrollment decision. On the NELS:88 Second Follow-up survey (1992), 1988 eighth graders did not indicate that location, measured on one of those dimensions--living at home--was a very important consideration in choosing a college; only 10 percent of baccalaureate-bound students indicated that being able to live at home was very important to them (Table 14A). However, a greater percentage of women than men, of Hispanics than of whites or blacks and of those in the lowest

and middle socioeconomic categories reported that it was a very important consideration for them. (Since this analysis is limited to four-year institutions, the higher incidence for Hispanics is not the community-college effect noted earlier.) Only five percent of 1988 eighth graders in the highest 1992 test quartile said that choosing an institution that would allow them to live at home was very important, a significantly lower percentage than in the other test quartile groups (Table 14B).

Of the 1988 eighth graders attending public or private four-year institutions by 1994, 27 percent listed a low crime environment as a very important consideration in their choice of a college. Not surprisingly perhaps, a higher percentage of women than men were interested in safe surroundings. Higher percentages of Asians and blacks exhibited concern about crime than did Hispanics and whites (Table 15A). The percentage of students indicating that crime was a very important consideration decreased as one moved up both the socioeconomic status and tested achievement quartiles; within the high tested achievement quartile, a higher percentage of women than men again indicated that a safe environment was important to them. There were no differences by racial/ethnic divisions (Table 15B).

Out-of-state attendance. To the extent that geographic location matters to students, whether it comes in the form of being able to attend a postsecondary institution close to home and family or far away from them, the lack of desirable programs within a given area could restrict choice. (For that matter, it could restrict access as well.) Enrollment in an out-of-state institution may reflect a positive personal preference or a location constraint. The decision to pursue postsecondary education out of state may depend on a number of factors, including the types of in-state alternatives and the student's available financial resources. While many states offer a wide range of postsecondary education, in general, students who can attend postsecondary institutions outside of their home state have access to an even wider range of options, albeit in most instances at a higher net financial cost to them. Unfortunately, some students may not be able to afford to take advantage of this wider range of opportunities.

Almost three-fourths of 1988 eighth graders who subsequently enrolled in a four-year postsecondary institution did so in their home state (Table 16A). A higher percentage of blacks than Hispanics indicated attendance at an out-of-state college or university. Also, a higher percentage of students in the highest socioeconomic and/or highest tested achievement quartiles reported out-of-state enrollment (Table 16A).

In the highest test quartile, about one-third of males and females attended out-of-state colleges, and over 40 percent of the highest socioeconomic quartile did as well, the latter being a significantly higher percentage than the other socioeconomic groups.

Institution of choice. Those who eventually matriculated at a postsecondary institution had to employ their considerations and selection criteria, from net cost to reputation to location, as well as an assessment of their own abilities and constraints, in coming to a decision about which college or university they would like to attend. When they weighed all of these factors and available information, completed the application process, and finally were accepted, to what degree were their hopes to attend a particular postsecondary institution fulfilled?

In 1992, 1988 eighth grade cohort members were asked to list the names of their first and second postsecondary institutions of choice. Of those who then had actually attended at least one four-year college or university in the interim (i.e., 1992 to 1994), 71 percent indicated in 1994 that they were able to attend their first or second choice institution (Table 17A). <15> There was no significant difference across sex, race/ethnicity, socioeconomic, and test groups with regard to the percentage of students who were able to attend one of their preferred institutions.

Within the highest tested achievement quartile, 69 percent reported that they were able to attend one of their preferred institutions. There was no significant difference with regard to attendance in a preferred institution within the high achievement test group by sex, race/ethnicity, or socioeconomic status (Table 17B).

For 71 percent of the students to have been matched with an institution of choice is a strong indication that the widely varied preferences of baccalaureate-bound students are being satisfied by the postsecondary education system, at least in terms of admission. Of course, this does not mean that these students' preferences and expectations will be met, or remain constant, once they enroll and progress toward their undergraduate degree and program objectives. But it does suggest that the availability of information and the varied postsecondary landscape are serving high school graduates well as they leave one educational environment and begin the task of adapting to a new one.

Intensity of enrollment. Not being able to attend college at a level of intensity that assures timely degree completion may limit one's ability to establish and to achieve educational and career goals. Among 1988 eighth graders who attended four-year institutions, over 96 percent were enrolled full-time, a path that one would expect to lead to more timely program completions as they work toward the baccalaureate; the percentage was 98 for those in the highest test quartile (Tables 18A and 18B). There were no significant differences by sex or race/ethnicity with regard to the intensity of enrollments. However, a greater percentage of those in the highest socioeconomic and tested achievement quartiles attended full-time, compared to those in the lowest and middle two quartiles. Within the highest tested achievement quartile, however, no significant differences were observed by sex, race/ethnicity, or socioeconomic status.

Conclusions

Any discussion of postsecondary education must include an assessment of how well it is serving its current participants and the nation as a whole. That assessment, in keeping with the postsecondary education world itself, should be multidimensional in nature. This particular essay has restricted its coverage to some aspects of access and choice that can be gleaned from NELS:88 data. Within this scope, then, one should attempt to measure postsecondary education in terms of how well it serves racial and ethnic minorities, and those on the lower socioeconomic rungs in comparison with those whose backgrounds and circumstances are more privileged.

With regard to gender, it is important to investigate whether young females hold educational expectations different from their male counterparts, and whether in high school females are represented in programs similar to males, test as well as males, and receive diplomas at the same rate as males. Compared to males, it is important to test whether females follow similar postsecondary education paths--with regard to the type, timing, and intensity of enrollment. These and other differences that can be detected for women versus men can, and should, be examined for the other categories of potential barriers and inequalities as well. This section provides each of these comparisons.

Gender. Data from NELS:88/94 (the Third Follow-up) suggest that females in the 1988 eighth grade cohort held similar or even higher educational expectations compared to males. In comparison with their male counterparts, a higher percentage of women also chose or were "tracked into" academic over vocational or general programs. A smaller percentage of women than men scored in the lowest 1992 test quartile, and a higher percentage of women scored in the middle two test quartiles, while there was no observed difference between men and women in the highest test quartile.¹⁶ A smaller percentage of women than men failed to file a postsecondary application by 1992, and a greater percentage of women filed multiple postsecondary applications. Thus, on these various access comparisons, which hold for the overall 1988 eighth grade cohort and for the high tested achievement quartile, women appear to be at least on a par with men in terms of being positioned to take advantage of postsecondary educational opportunities

With regard to choice, women and men in NELS:88 enrolled in public and private not-for-profit four-year institutions by 1994 in approximately equal percentages. Women attending four-year institutions also enrolled out of state, attended full-time, and attended an institution of their choice at the same rates as men. Again, these conclusions hold both for the aggregate NELS:88 cohort with postsecondary enrollment by 1994 and for those in the highest 1992 test quartile. Thus, on the criterion of choice, postsecondary education again appears to be meeting the needs of women at least as well as it does for men. There are few observed sex differences across NELS:88 categories, and where there are differences, they tend to favor women. On the criteria of access and choice, then, there do not appear to be postsecondary education barriers that affect women disproportionately

Race/ethnicity. While in high school, a higher percentage of Asian students reported the expectation of earning at least a bachelor's degree than for any racial/ethnic group, and a significantly lower percentage of Hispanics than whites held this level of expectation (there were no significant differences across other racial/ethnic categories). Asians also had higher percent

enrollment in academic tracks and had higher high school graduation rates. (With regard to academic program enrollment and graduation, whites showed higher rates than blacks and Hispanics; there were no significant differences between these last two groups.) Within the highest achievement test quartile, racial/ethnic differences by enrollment or graduation disappeared, though higher percentages of Asians and Whites than blacks and Hispanics ranked in the highest quartile on the cognitive test composite.

A higher percentage of Asians than other racial/ethnic groups filed postsecondary applications and enrolled in postsecondary institutions right after high school. Again, these differences disappear in the highest test quartile. A higher proportion of blacks and Hispanics, even within the highest tested achievement quartile, exhibited two or more at-risk factors than whites and Asians. The tendency for Hispanics to enroll in public two-year colleges and for blacks to enroll out of state were the only pronounced postsecondary attendance patterns, and even these do not hold for the highest test quartile. There were no racial or ethnic differences with regard to attendance at a preferred four-year institution, or the tendency to enroll full-time in a four-year institution.

Socioeconomic status. More observed differences across the potential access and choice barriers (i.e., sex, race/ethnicity, socioeconomic conditions, or tested achievement) occur by socioeconomic status, and they occur from the outset. Educational expectations, in terms of the percentages of those who indicated achievement of at least a bachelor's degree, vary directly by socioeconomic ranking. The same is true for representation in academic tracks in high school, the rate of earning a regular high school diploma, and performance on the cognitive test battery. This pattern continues with respect to the postsecondary application process, where a smaller percentage of 1988 eighth graders in the lowest socioeconomic quartile completed applications. In turn, a smaller percentage from this group matriculated, and when they did enroll there was more delay and a higher incidence of enrollment at public two-year institutions (and in state).

On the personal side, the percentage of 1988 eighth graders who had never married by 1994, and the percentage who reported not having children, varied directly by socioeconomic status. Within the high tested achievement quartile, however, many of these socioeconomic differences disappear or are lessened.

Tested achievement. Those in the highest tested achievement quartile have the fewest postsecondary access and choice barriers. Their initial expression of educational expectations in the eighth grade and their higher rate of postsecondary enrollment characterize them as well motivated. Their higher rate of out-of-state enrollment suggests that they are more mobile than their counterparts; and, for lack of a better word, their discipline as regards the timing of marriage and children position them to take better advantage of the opportunities that the heterogeneous postsecondary world has to offer.

Specifically, over 90 percent of this group want at least a baccalaureate degree from the outset. They take academic subjects in high school, receive their diplomas on time, file multiple applications, enroll soon after high school graduation (mostly in four-year institutions). On the personal side, they are saddled with fewer at-risk factors to begin with, and they do not marry or have children by their early twenties, which reduce even further the obstacles in their paths to achieving their educational goals.

When one restricts comparisons to those in the highest tested achievement quartile, some differences observed for the overall eighth grade cohort with regard to race/ethnicity or socioeconomic status disappear. This is true for type of high school program attended (i.e., academic vs. general/vocational track) and high school graduation rate. However, Asians and whites tend to exhibit significantly different levels for some of the other access and choice variables, such as at-risk factors and application patterns.

The most glaring inequalities within the high tested achievement quartile occur across socioeconomic divisions, as opposed to sex or racial/ethnic differences. Although there were no observed differences in terms of high school programs pursued or graduation rates by socioeconomic quartile, personal considerations (i.e., at-risk factors, marriage rates, and the incidence of parenthood), postsecondary application patterns and attendance, institution type (four-year versus other and in-state versus out-of-state), and intensity of enrollment were associated with one's socioeconomic grouping. Some of these same access and choice barriers appear to be present by socioeconomic status, as opposed to sex or race/ethnicity, for the whole 1988 eighth grade cohort as well as for those in the 1992 highest tested achievement quartile.

Endnotes

- <1> In addition, laws such as those that prohibit or significantly restrict employment opportunities for those under 16 years of age who might otherwise choose work over school do not generally restrict individuals in the postsecondary education age range from making that choice. This means that employment may represent an attractive alternative to more education for some young people.
- <2> Chapter 6 in the NELS:88/92 report *A Profile of the American High School Senior in 1992* (June 1995) discusses in some detail parental educational attainment and parents' expectations for their children (vs. their children's own expectations) as of 1992. Thus, the current essay will not cover that same ground. However, inasmuch as parents' educational backgrounds may affect family decision-making with regard to human capital investments as well as the desired educational and occupational horizons as seen by their children, this factor should be acknowledged explicitly in any treatment of educational access. In addition, the Table Compendium that follows this essay--see section 1 and table 1-1--provides several important linkages in this regard. Those include the fact that: 1988 eighth graders whose parents completed high school or less were more likely to set their own educational expectations at that level than were those whose parents had at least a bachelor's degree; and students whose parents finished college or earned graduate degrees were more likely to expect to obtain a graduate degree themselves than those whose parents had completed high school or less. These relationships hold for both the mother's and the father's level of educational attainment.
- <3> In these analyses expectations of bachelor degree attainment was combined with expectations to attain all other higher degrees, in part because one has to obtain the former before being admitted into graduate and first professional programs. Just as completing high school is a prerequisite for beginning college, a college degree is an access variable with regard to participation in graduate school/first professional program.
- <4> With regard to expectations or any of the other dimensions on which postsecondary access and choice issues are discussed in this essay, distributions are presented by sex, race/ethnicity, socioeconomic status, and tested achievement. There is obviously overlap among variables, and to the extent that, say, socioeconomic status and ethnicity are highly correlated, distribution comparisons by race/ethnicity and by socioeconomic quartile may actually represent only one comparison not two. The table below provides cross-tabulations for race with both socioeconomic level and test quartile. As is apparent, blacks and Hispanics fall disproportionately in the bottom socioeconomic and test quartiles, while Asians and whites are over-represented in the top quartiles, relative to their presence in the overall 1988 eighth grade cohort. However, in the middle fifty percent of each distribution, there is significant representation across all racial/ethnic groups. In fact, it is only in the highest socioeconomic and test quartiles that one notices a predominance of only one of the four racial/ethnic groups--whites. In virtually all other situations, distinctions made in the text by socioeconomic status or test quartile would not be referring implicitly to any one racial/ethnic group.

Race/ethnicity by socioeconomic status and achievement test quartile

Note: Rows may not sum to 100 percent due to rounding.

- <5> Because of the small percentage of students in vocational programs, and because our main focus in this report is academic preparation for four-year colleges, the vocational and general categories were combined.
- <6> The true dropout rate is difficult to calculate as cohort members might report "still trying" while moving to a "dropout" status. Distinguishing between these categories at this point in the development of this cohort is difficult, and for this reason we turn our focus in this essay toward those who have graduated and/or received the necessary prerequisites to participate in postsecondary education.
- <7> The quartile rankings for tested achievement and socioeconomic status were intended to produce an approximately symmetric division of the NELS:88/94 sample, with 50 percent in the middle group and 25 percent in the upper and lower tails of the distribution. The actual breakdown deviates from this intention for two reasons. First, the underlying centile scores are expressed as integer values. Therefore, any regrouping into quartiles will only be approximate. Second, the centile ranking was constructed using the NELS:88/92 Second Follow-up questionnaire weight. Thus, the analyses using the 1988 eighth grade cohort and Third Follow-up weight will also produce a degree of asymmetry when quartiles are defined. Nonetheless, the observed deviation was not dramatic, resulting in a lower quartile that is slightly more exclusive (23.0%) and an upper quartile that is slightly more inclusive (26.9%).
- <8> The application process is one important step in access to postsecondary education. Thus, variations in reported application patterns by sex, race/ethnicity, socioeconomic status, and tested achievement are one indication of possible inequality, and thus less diversity, in postsecondary educational participation than in elementary and secondary school programs. This is a concern expressed at the outset of this essay, and one to which we will return later.
- <9> Attendance in this report is measured by the variable NUMATND1 (Number of attendance spells at the first postsecondary institution attended). This was used (indirectly) as an index of whether or not a respondent ever attended a postsecondary

institution, and whether there were gaps in attendance at that institution. It should not be misinterpreted as an indication of whether the respondent attended more than one institution. See the Glossary for more information on this variable.

- <10> The "at-risk" factors used in this report are the same ones used in a number of previous NCES reports (Hafner, A., Ingels, S.J., Schneider, B., and Stevenson, D.L. *A Profile of the American Eighth Grader*, 1990; NCES 90-458; Green, P.J., and Scott, L.A. *"At-Risk" Eighth Graders Four Years Later*, NCES, 1995; NCES 95-380; Kaufman, P., and Bradby, D. *Characteristics of At-Risk Students in NELS:88*, 1992; NCES 92-042). These factors have been suggested by previous studies (e.g., Pallas, A., Natriello, G., and McDill, E. "The Changing Nature of the Disadvantaged Population: Current Dimensions and Future Trends," *Educational Researcher* (June-July 1989).) as increasing the risk of school failure. The factors chosen are a small subset of factors related to the risk of school failure. Kaufman and Bradby (1992) have identified others.
- <11> Green, P.J., and Scott, L.A. *"At-Risk" Eighth Graders Four Years Later*, NCES, 1995; NCES 95-380.
- <12> It should be noted that the 33 percent of 1988 eighth graders in the lowest test quartile with two or more risk factors may also be an underestimate because many in the high at-risk category did in fact drop out, and test scores are missing from a larger percentage of dropouts than any other group.
- <13> The analysis has done relatively little with the marital status variable because of uncertainties about the "in a marriage-like relationship" category. For purposes of postsecondary education decisions, which include attendance, intensity of enrollment, and even financing one's studies, it is not clear if people in the "marriage-like relationship" group, who constitute 7 percent of 1988 eighth graders overall, behave more like single or married respondents. Furthermore, inasmuch as little is known about the divorced-separated-widowed members, this was another complication with delving too deeply into the marital status variable.
- <14> The NELS:88/94 surveys were not designed to elicit substantial information on how students and their families finance higher education, or how financial aid affects enrollment decisions; understanding those considerations has been the chief goal of the National Postsecondary Student Aid Study, NPSAS:90-93. As such, this essay does not dwell on issues of tuition, financial aid, and/or the net costs of postsecondary education to students and their families.
- <15> To the extent that 1988 eighth grade cohort members listed their institutions of choice in the spring of 1992 after having filed completed applications, and in some instances after they may have already received admission results from some colleges or universities, there was undoubtedly selection bias in terms of listing; that is, it is unlikely that a high school senior would have listed as his or her first and second choice institutions to which he/she had already been denied admission.
- <16> With regard to sex differences, one can presumably at first blush treat as constant racial/ethnicity, socioeconomic, and at-risk factors, since these should be largely independent of sex. This will not be the case when the review turns to the other equity

variables. The only area in which one could see sex differences that matter would be in marriage rates and fertility, which, as noted in the body of the essay, is attributable to different ages at first marriage between men and women.

Table Compendium

Section 1

Education Experiences

1994 Highest Level of Expected Education

- In 1994, 1988 eighth grade women were more likely to expect to obtain a graduate degree than were 1988 eighth grade men (Table 1-1) (37 percent to 32 percent).
- 1988 eighth graders who had one or more children by 1994 were more likely to expect only to obtain a high school diploma or less compared to those without children (Table 1-1) (28 percent to 8 percent).
- A greater percentage of 1988 eighth graders without children than those with children by 1994 expected in 1994 to obtain a graduate degree (Table 1-1) (39 percent to 12 percent).
- 1988 eighth graders who were in the highest socioeconomic quartile were more likely to expect in 1994 to obtain a graduate degree than those in the middle two and lowest socioeconomic quartiles (Table 1-1) (61 percent to 30 percent and 16 percent respectively).
- In 1994, a higher percentage of 1988 eighth grade Asians or Pacific Islanders expected to obtain graduate degrees than 1988 eighth grade Hispanics, blacks, and whites (Table 1-1) (50 percent to 25 percent, 29 percent, and 37 percent respectively).
- 1988 eighth graders who were single in 1994 were more likely to expect to obtain a graduate degree than those who were in a marriage-like relationship, were married, or were divorced, separated, or widowed in 1994 (Table 1-1) (39 percent to 16 percent, 12 percent, and 12 percent respectively).
- 1988 eighth graders whose parents finished college or earned graduate degrees were more likely in 1994 to expect to obtain a graduate degree than those whose parents completed high school or less (Table 1-1) (54 percent and 70 percent to 22 percent respectively for fathers; 56 percent and 64 percent to 24 percent respectively for mothers).
- 1988 eighth graders who attended Catholic or other (non-Catholic) private sector high schools were more likely in 1994 to expect to obtain a graduate degree than those who attended public sector high schools (Table 1-2) (59 percent and 68 percent to 34 percent).
- 1988 eighth graders in the highest 1992 test quartile were more likely in 1994 to expect to obtain a graduate degree than those in the middle two or lowest 1992 test quartiles (Table 1-2) (67 percent to 34 percent and 13 percent respectively).

Enrollment Status in First Postsecondary Educational Institution

- A greater percentage of 1988 eighth graders who enrolled by 1994 in a postsecondary education institution and whose parents finished college or earned graduate degrees enrolled in their first postsecondary institution full-time by 1994 than those whose parents completed high school or less (Table 1-3) (90 percent and 92 percent compared to 80 percent respectively for fathers; 91 percent and 90 percent compared to 83 percent respectively for mothers).
- 1988 eighth graders who enrolled by 1994 in a postsecondary education institution and were in the lowest 1992 test quartile were less likely to have enrolled in their first postsecondary institution full-time by 1994 than those in the middle two and highest 1992 test quartiles (Table 1-4) (76 percent compared to 85 percent and 93 percent respectively).
- A higher percentage of 1988 eighth graders who enrolled by 1994 in a postsecondary education institution and who, in 1992, expected to obtain a baccalaureate or a graduate degree enrolled in their first postsecondary education institution full-time by 1994 than those who expected to complete trade or vocational education, or to complete some college (Table 1-4) (87 percent and 93 percent compared to 71 percent and 77 percent respectively).
- 1988 eighth graders who, by 1992, had used crack or cocaine either on one or two occasions or from three to nineteen occasions during their lifetime were more likely in 1994 to report no postsecondary education enrollment than those who had never used crack or cocaine (Table 1-5) (64 percent and 52 percent compared to 33 percent respectively).
- 1988 eighth graders with parents whose education did not go beyond high school were more likely not to have enrolled in a postsecondary education institution by 1994 than those whose parents finished college or earned a graduate degree (Table 1-5) (50 percent compared to 16 percent and 10 percent respectively for fathers; 48 percent compared to 17 percent and 14 percent respectively for mothers).

Continuity of Enrollment in First Postsecondary Educational Institution

- 1988 eighth graders who were single in 1994 were more likely to be still enrolled in their first postsecondary institution than those who were married, were in a marriage-like relationship, or were divorced, separated, or widowed in 1994 (Table 1-6) (63 percent compared to 32 percent, 31 percent, and 19 percent respectively).
- 1988 eighth graders who, by 1992, had never consumed alcohol, had consumed it on one or two occasions, or had consumed it on three to nineteen occasions were more likely to be still enrolled in their first postsecondary education institution than those who had consumed alcohol on twenty or more occasions (Table 1-6) (66 percent, 67 percent, and 65 percent compared to 55 percent respectively).
- 1988 eighth graders whose parents finished college or earned a graduate degree were more likely to be still enrolled in their first postsecondary education institution in 1994 than those whose parents finished high school or less (Table 1-6) (69 percent and 72 percent compared to 54 percent respectively for fathers; 68 percent and 69 percent compared to 54 percent respectively for mothers).
- A greater percentage of 1988 eighth graders in the highest 1992 test quartile were still enrolled in their first postsecondary institution in 1994 than those in the lowest or middle two 1992 test quartiles (Table 1-7) (74 percent compared to 45 percent and 60 percent respectively).
- 1988 eighth graders who were high school graduates by 1994 were more likely to be still enrolled in their first postsecondary institution in 1994 than those who had a GED or equivalent by 1994 (Table 1-7) (62 percent compared to 23 percent).

Section 2

Labor Force Participation and Earnings

The analyses reported in this section represent one of three populations, as noted below and in the tables: 1) 1988 eighth graders in the labor force in 1993 (including sample members employed for one or more months in 1993 who reported that they were not students or that they were students but were primarily employed in 1993 and sample members who were unemployed for all of 1993 but were seeking work; 2) 1988 eighth graders employed in 1993 (sample members who were in the labor force in 1993, excluding those who were unemployed for all of 1993); and 3) all 1988 eighth graders.

Employment, Unemployment, and Earnings

Of the 1988 eighth graders who were employed for one or more months in 1993:

- Men's 1993 average total earnings exceeded those of women (Table 2-1) (\$10,194 to \$6,723).
- Those in the lowest socioeconomic quartile were unemployed longer in 1993 than those in the middle two socioeconomic quartiles (Table 2-1) (1.8 compared to 1.2 months).
- Blacks were unemployed longer in 1993 than 1988 eighth grade whites, Asians or Pacific Islanders, and Hispanics (Table 2-1) (3.2 to 0.9, 1.3, and 1.8 months respectively).
- Those in the lowest and middle two 1992 socioeconomic quartiles held fewer jobs in 1993 than those in the highest test quartile (Table 2-1) (1.6 and 1.6 to 1.9 respectively).
- Those in the highest 1992 test quartile were unemployed for fewer months in 1993 than those in the lowest or middle two test quartiles (Table 2-2) (0.6 to 2.0 and 1.0 respectively).
- Those who expected, in 1992, to obtain a baccalaureate degree were unemployed for fewer months in 1993 than those who expected to obtain a high school diploma or less (Table 2-2) (1.1 to 2.1 months).

Of the 1988 eighth graders who were in the labor force in 1993:

- Those in the lowest socioeconomic quartile were more likely to be unemployed from six to twelve months in 1993 than those in the middle two socioeconomic quartiles (Table 2-3) (14 percent to 9 percent).
- Blacks were more likely to be unemployed from six to twelve months in 1993 than whites, Asian/Pacific Islanders, or Hispanics (Table 2-3) (27 percent to 7 percent, 10 percent, and 14 percent respectively).
- A greater percentage of those in the lowest 1992 test quartile were unemployed from six to twelve months in 1993 than those in the middle two or highest test quartiles (Table 2-

4) (17 percent to 8 percent and 4 percent respectively).

- Those who were high school dropouts by 1994 were more likely to be unemployed from six to twelve months in 1993 than those who were high school graduates (Table 2-4) (18 percent to 8 percent).
- A higher percentage of those with two or more at-risk of school failure factors were unemployed from six to twelve months in 1993 than those with no at-risk factors or with one at-risk factor (Table 2-4) (15 percent to 7 percent and 12 percent respectively).

The results reported below are based on the full eighth grade cohort, without selection for 1993 labor force status.

- A smaller percentage of 1988 eighth grade men than women were employed for only one to five months in 1993 (4 percent to 6 percent), while a smaller percentage of 1988 eighth grade women than men were employed for six or more months in 1993 (Table 2-5) (24 percent to 36 percent).
- 1988 eighth grade blacks were more likely to be unemployed for all of 1993 than were Asian/Pacific Islanders, Hispanics, or whites (Table 2-5) (8 percent to 1 percent, 3 percent, and 1 percent respectively).
- 1988 eighth graders who had one child or more by 1994 were more likely to be unemployed for the whole year in 1993 than those without children (Table 2-5) (8 percent to 2 percent).
- A higher percentage of 1988 eighth graders who attended public sector high schools were unemployed for all of 1993 than those who attended other private high schools (Table 2-6) (2 percent to 1 percent).
- 1988 eighth graders who participated in vocational high school programs were more likely to be employed for six or more months in 1993 than those who participated in traditional academic or other high school programs (Table 2-6) (55 percent to 21 percent and 42 percent respectively).
- A greater percentage of 1988 eighth graders who, in 1992, expected to obtain a high school diploma or less were unemployed for all of 1993 than those who expected to obtain a baccalaureate or graduate degree (Table 2-6) (8 percent to 1 percent and 1 percent respectively).

1993 Employment Conditions and Employee Fringe Benefits

Of the 1988 eighth graders who were employed in 1993:

- Men were more likely than women to report receiving employer-provided medical benefits (52 percent to 38 percent), dental benefits (36 percent to 27 percent), life insurance (38 percent to 26 percent), sick days with pay (39 percent to 32 percent), paid vacation (53 percent to 46 percent), pension plans (32 percent to 21 percent), and childcare assistance (13 percent to 7 percent) from their longest held job in 1993 (Table 2-7).
- Whites and Hispanics were more likely than blacks to receive employer-provided medical benefits in their longest held job in 1993 (Table 2-7) (47 percent and 45 percent to 35 percent respectively).
- A greater percentage of whites than Hispanics and blacks received employer-provided unpaid leave to care for others in their longest held job in 1993 (Table 2-7) (45 percent to 34 percent and 27 percent respectively).
- Those with two or more at-risk of school failure factors were less likely to receive employer-provided unpaid leave to care for others in their longest held job in 1993 than those with no at-risk factors (Table 2-7) (35 percent to 45 percent).

<a> This table is based on 1988 eighth graders whose 1993 labor force status indicated they were students but were primarily employed in 1993 or were not students and were employed one or more months during 1993.

Tuition Assistance, Job Training, and Job Satisfaction

Of the 1988 eighth graders employed in 1993:

- Blacks were more likely than whites to report receiving on-site formal training at their longest held job in 1993 (86 percent to 70 percent) (Table 2-8).
- A higher percentage of whites than blacks reported receiving employer-provided tuition assistance at their longest held job in 1993 (Table 2-8) (27 percent to 12 percent).
- Men reported spending more weeks and more hours per week attending job training for their longest held job in 1993 than 1988 eighth grade women (Table 2-9) (12 weeks to 6 weeks; 29 hours per week to 16 hours per week).
- A greater percentage of men than women reported being very satisfied with opportunities for advancement in their longest held job in 1993 (Table 2-10) (32 percent to 27 percent).
- Whites were more likely than blacks to be very satisfied with job security (46 percent to 31 percent) and with working conditions (44 percent to 33 percent) in their longest held job in 1993. (Table 2-10).
- A higher percentage of those in the middle two socioeconomic quartiles than those in the lowest quartile were very satisfied with job security in their longest held job in 1993 (Table 2-10) (46 percent to 39 percent).
- Those who were married by 1994 were more likely to be very satisfied with the opportunity to use their education in their longest held job in 1993 than those who were never married, were divorced, separated or widowed, or were in a marriage-like relationship (Table 2-10) (35 percent to 27 percent, 16 percent, and 23 percent respectively).
- A greater percentage of those who were married by 1994 were very satisfied with job security in their longest held job in 1993 than those who had never married or were in a marriage-like relationship in 1994 (Table 2-10) (51 percent to 42 percent and 36 percent respectively).

Expected Occupations and Incomes

The following analyses represent the self-reports for all 1988 eighth graders in 1994 regarding the occupation and income they expected to have at age 30. It may be useful to note that *CPS Trends in Income: 1990-1992* estimates median income of 25-34 year olds in 1992 as \$21,605 for males and \$13,713 for females. By contrast, the NELS:88/94 respondents reported expectations of \$63,719 for males and \$44,683 for females at age 30. It is apparent that the income expectations of the NELS:88/94 respondents are, to say the least, optimistic even taking into account potential inflation by the time they reach age 30. Therefore, the data on income expectations reported below should be considered in terms of relative differences among subgroups rather than absolute dollar amounts.

- 1988 eighth grade women were more likely than 1988 eighth grade men to expect in 1994 to be in a clerical occupation at age 30 (27 percent compared to 4 percent). However, men were more likely than women to report expecting to be craftsmen by age 30 (Table 2-11) (31 percent compared to 4 percent).
- A greater percentage of 1988 eighth grade women than men reported in 1994 that they expected to be school teachers at age 30 (Table 2-11) (16 percent compared to 7 percent).
- A smaller percentage of 1988 eighth graders in the lowest socioeconomic quartile than those in the middle two and highest quartiles expected in 1994 to be school teachers by age 30. (Table 2-11) (9 percent compared to 12 percent and 13 percent).
- In 1994, 1988 eighth graders who were enrolled in high school vocational programs were more likely to expect to be craftsmen by age 30, compared to those in academic or other high school programs (Table 2-12) (36 percent compared to 14 percent and 22 percent).
- 1988 eighth grade men expected in 1994 to have higher incomes by age 30 than did 1988 eighth grade women (Table 2-13) (\$63,157 to \$44,649).
- The 1994 reported average income expected by age 30 was higher for 1988 eighth graders in the highest socioeconomic quartile than for those in the middle two or lowest socioeconomic quartiles (Table 2-13) (\$62,817 compared to \$55,789 and \$46,137, respectively).

- 1988 eighth graders without children by 1994 expected in 1994 to have higher incomes by age 30 than did those with one or more children (Table 2-13) (\$56,031 to \$39,872).
- 1988 eighth grade blacks expected in 1994 to have higher incomes by age 30 than did Hispanics (Table 2-13) (\$66,966 compared to \$48,474).
- 1988 eighth graders who, in 1992, expected to earn a graduate degree also reported higher expected incomes by age 30 in 1994 than those who expected to complete less than four years of college, or to complete high school or less (Table 2-14) (\$61,775 to \$45,961, and \$45,838, respectively).

Section 3

Sex, Marriage, and Family

The data reported in this section describe the relationship between various characteristics and marriage, family, and sexual experiences reported in 1994 by the 1988 eighth grade cohort members. These variables provide a context for assessing important factors in the personal development of the cohort as they move beyond high school.

Reported Sexual Experiences

- The majority of 1988 eighth graders overall reported having had sexual intercourse by 1994. Women were more likely than men to report that they had not had intercourse by 1994 (Table 3-1) (18 percent to 14 percent).
- A greater percentage of 1988 eighth graders in the lowest socioeconomic quartile reported in 1994 that they had experienced their first sexual intercourse before high school than those in the middle two or highest socioeconomic quartiles (Table 3-1) (26 percent to 17 percent and 9 percent respectively).
- 1988 eighth grade Hispanics, blacks, and whites were more likely to report in 1994 that they had experienced their first sexual intercourse before high school than 1988 eighth grade Asians or Pacific Islanders (Table 3-1) (17 percent, 32 percent, and 15 percent to 8 percent).
- 1988 eighth graders who participated in vocational and other high school programs were more likely to report in 1994 that they had experienced their first sexual intercourse before high school than those who participated in academic high school programs (Table 3-2) (26 percent and 26 percent to 11 percent respectively).
- In 1994, a higher percentage of 1988 eighth graders who had graduated from high school by 1994 reported that they had experienced their first sexual intercourse after high school than those who were high school dropouts or had a GED or equivalent by 1994 (Table 3-2) (15 percent to 4 percent and 3 percent respectively).
- 1988 eighth graders who, in 1992, expected to complete some college after high school, finish college, or earn a graduate degree were more likely to report in 1994 never having sexual intercourse than those who expected only to complete high school or less (Table 3-2) (11 percent, 19 percent, 23 percent to 5 percent respectively).
- Overall reported usage of birth control during first sexual intercourse was high for 1988 eighth grade cohort members. A greater percentage of men than women reported in 1994 not using birth control during their first sexual intercourse (Table 3-3) (29 percent to 25 percent).

- 1988 eighth graders in the highest and middle two socioeconomic quartiles were more likely in 1994 to report having used birth control during their first sexual intercourse than those in the lowest socioeconomic quartile (Table 3-3) (80 percent and 75 percent to 64 percent respectively).
- In 1994, a higher percentage of 1988 eighth graders with children than those without children reported not having used birth control during their first sexual intercourse (Table 3-3) (43 percent to 23 percent).
- 1988 eighth grade Asians/Pacific Islanders, blacks, and whites were more likely in 1994 to report having used birth control during their first sexual intercourse than 1988 eighth grade Hispanics (Table 3-3) (72 percent, 70 percent, and 76 percent to 61 percent respectively).
- 1988 eighth graders in the middle two and highest 1992 test quartiles were more likely in 1994 to report having used birth control during their first sexual intercourse than those in the lowest 1992 test quartile (Table 3-4) (76 percent and 85 percent to 68 percent respectively).
- 1988 eighth graders who were high school dropouts or had a GED or equivalent by 1994 were more likely in 1994 to report not having used birth control during their first sexual intercourse than those who were high school graduates by 1994 (Table 3-4) (48 percent and 44 percent to 22 percent respectively).
- In 1994, a smaller percentage of 1988 eighth graders who, in 1992, expected only to complete high school reported using birth control during their first sexual intercourse than those who expected to complete some college, finish college, or earn a graduate degree (Table 3-4) (60 percent to 73 percent, 80 percent, and 81 percent respectively).
- 1988 eighth graders not married in 1994 in the lowest socioeconomic quartile were more likely in 1994 to report not having used birth control during their last sexual intercourse than those in the middle two or highest socioeconomic quartiles (Table 3-5) (26 percent to 17 percent and 13 percent respectively).
- In 1994, a greater percentage of 1988 eighth graders not married in 1994 who were high school graduates by 1994 reported having used birth control during their last sexual intercourse than those who were high school dropouts by 1994 (Table 3-6) (85 percent to 66 percent).
- 1988 eighth graders not married in 1994 with no 1988 at risk of school failure factors were more likely to report in 1994 having used birth control during their last sexual intercourse than those with two or more 1988 at-risk factors (Table 3-6) (86 percent to 73 percent).

Marital Status and Family

- The majority of 1988 eighth graders had never been married by 1994. Men were more likely than women to be single, never married (88 percent to 78 percent). 1988 eighth grade women were more likely than men to be married or in a marriage-like relationship in 1994 (Table 3-7) (13 percent to 6 percent for those married; 8 percent to 5 percent for those in marriage-like relationships).
- Only 1 percent of 1988 eighth graders overall reported that they were divorced, separated, or widowed in 1994. Those in the lowest and middle two socioeconomic quartiles were more likely to be divorced, separated, or widowed by 1994 than those in the highest socioeconomic quartile (Table 3-7) (3 percent and 1 percent to 0.3 percent respectively).
- 1988 eighth grade Hispanics were more likely to be married in 1994 than Asians/Pacific Islanders, blacks, or whites (Table 3-7) (14 percent to 4 percent, 3 percent, and 10 percent respectively).
- 1988 eighth graders who attended public sector high schools were more likely to be married in 1994 than those who attended Catholic high schools (Table 3-8) (9 percent to 2 percent).
- 1988 eighth graders in the lowest 1992 test quartile were more likely to be divorced, separated, or widowed by 1994 than those in the highest test quartile (Table 3-8) (1 percent compared to 0.3 percent).
- 1988 eighth graders who, in 1992, expected to have an education of high school or less, or to attend trade school or to complete some college after high school, were more likely to be married by 1994 (20 percent, 14 percent, and 12 percent respectively) than those who expected to finish college or earn a graduate degree (Table 3-8) (5 percent and 4 percent respectively).
- 1988 eighth grade women were more likely than 1988 eighth grade men to have one child, or two or more children by 1994 (Table 3-9) (16 percent to 8 percent for one child; 6 percent to 2 percent for two or more children).
- 1988 eighth graders in the highest and middle two socioeconomic quartiles were more likely not to have children by 1994 than those in the lowest socioeconomic quartile (Table 3-9) (96 percent and 85 percent to 70 percent respectively).
- 1988 eighth grade Hispanics, and blacks were more likely to have two or more children by 1994 than 1988 eighth grade Asians/Pacific Islanders and whites (Table 3-9) (8 percent, and 9 percent to 2 percent and 2 percent respectively).
- 1988 eighth graders who attended Catholic and other private high schools were more likely not to have children by 1994 than those who attended public sector high schools (Table 3-10) (96 percent and 96 percent to 85 percent).
- 1988 eighth graders from academic high school programs were more likely not to have children by 1994 than those from vocational and other high school programs (Table 3-10) (92 percent to 79 percent and 72 percent respectively).
- 1988 eighth graders who expected to complete some college after high school, earn a bachelor's degree, or earn a graduate degree were more likely not to have children by 1994 than those who expected in 1992 to have an education of high school or less (Table 3-10) (81 percent, 92 percent and 94 percent to 64 percent).
- 1988 eighth graders with one, or two or more, 1988 at risk of school failure factors were less likely to have no children by 1994 than those with no risk factors (Table 3-10) (84 percent and 70 percent to 91 percent, respectively).

- 1988 eighth grade women were more likely than 1988 eighth grade men to have children 48 months of age or older by 1994 (Table 3-11) (19 percent to 7 percent).

Dependent Support

- 1988 eighth grade Asians/Pacific Islanders and whites were less likely to provide annual support for another person in 1994 than Hispanics or blacks (Table 3-13) (3 percent and 4 percent to 11 percent and 12 percent, respectively).
- 1988 eighth graders in the lowest socioeconomic quartile were more likely to provide annual support for another person in 1994 than those in the middle two or highest socioeconomic quartiles (Table 3-13) (11 percent to 6 percent and 2 percent respectively).
- 1988 eighth grade men provided more annual support for another person in 1994 than did 1988 eighth grade women (Table 3-13) (\$147 to \$83).

<a> Estimates are averages of all respondents in a given subgroup, including those providing no support (\$0).

Section 4

Values, Leisure Time Activities, Volunteer Activities, and Voting Patterns

Values

- A higher percentage of 1988 eighth grade men than women reported in 1994 that having lots of money was very important (Table 4-1) (43 percent to 34 percent).
- 1988 eighth graders who attended public high schools were more likely to report in 1994 that having lots of money was very important than those who attended Catholic or other private high schools (Table 4-1) (39 percent to 32 percent and 18 percent respectively).
- A higher percentage of 1988 eighth graders who attended Catholic high schools than those who attended public high schools reported in 1994 that having strong friendships was very important (Table 4-1) (92 percent compared to 86 percent).
- A greater percentage of 1988 eighth graders in the lowest socioeconomic quartile than those in the middle two or highest 1992 socioeconomic quartiles reported in 1994 that having lots of money was very important (Table 4-1) (50 percent compared to 39 percent and 26 percent respectively).
- 1988 eighth graders in the lowest socioeconomic quartile were more likely to report in 1994 that providing their children with better opportunities was very important than those in the middle two or highest socioeconomic quartiles (Table 4-1) (96 percent and 93 percent to 84 percent).
- A higher percentage of 1988 eighth grade blacks than Asians/Pacific Islanders, Hispanics, or whites reported in 1994 that having lots of money was very important (Table 4-1) (58 percent to 41 percent, 44 percent, and 33 percent respectively).
- 1988 eighth grade whites and Asians/Pacific Islanders were more likely than Hispanics or blacks to report in 1994 that having strong friendships was very important (Table 4-1) (91 percent and 87 percent compared to 76 percent and 64 percent respectively).
- 1988 eighth graders who were high school graduates by 1994 were more likely to report in 1994 that having strong friendships was very important than those who were dropouts or who had a GED or equivalent by 1994 (Table 4-1) (88 percent to 72 percent and 80 percent respectively).
- A higher percentage of 1988 eighth grade men than women reported working on hobbies (59 percent to 47 percent) or participating in sports (63 percent to 34 percent) at least once a week on average in 1994 (Table 4-2).

Leisure Time Activities

- A greater percentage of 1988 eighth grade women than men reported reading for pleasure (71 percent to 66 percent) or spending time on religious activities (42 percent to 35 percent) at least once a week on average in 1994 (Table 4-2).
- A higher percentage of 1988 eighth grade women than men reported spending time talking to or doing things with parents in 1994 (Table 4-2) (84 percent to 78 percent).
- 1988 eighth graders who attended Catholic and other private high schools were more likely to report spending time on religious activities in 1994 than those who attended public high schools (Table 4-2) (47 percent and 54 percent to 38 percent respectively).
- 1988 eighth graders who attended a private not-for-profit four-year postsecondary institution as their first postsecondary institution were more likely to report spending time on religious activities in 1994 than those who attended private for-profit, public two-year, or public four-year postsecondary institutions (Table 4-2) (50 percent to 34 percent, 41 percent, and 43 percent respectively).
- A higher percentage of 1988 eighth grade blacks than whites reported reading for pleasure in 1994 (Table 4-2) (74 percent to 67 percent).
- 1988 eighth graders who were high school graduates or who had obtained a GED by 1994 were more likely to report reading for pleasure in 1994 than those who were dropouts (Table 4-2) (69 and 77 percent to 58 percent).
- 1988 eighth graders who, in 1992, expected to complete some college or to finish college or earn a graduate degree were more likely to report reading for pleasure at least once a week on average in 1994 than those who expected to complete high school or less (Table 4-2) (70 percent, 69 percent and 72 percent to 61 percent respectively).

Volunteer activities

Although in nearly all subgroups the majority of 1988 eighth graders reported in 1994 that they had not done any volunteer work, there were a number of differences in the degree of lack of volunteerism.

- 1988 eighth graders who participated in academic high school programs were less likely to report no volunteer work as of 1994 than those who participated in vocational or other high school programs (Table 4-3) (60 percent to 76 percent and 72 percent respectively).
- 1988 eighth graders who attended private not-for-profit four-year and public four-year institutions as their first postsecondary education institutions were less likely to report having done no volunteer work as of 1994 than those from private for-profit postsecondary education institutions (Table 4-3) (42 percent and 52 percent to 76 percent respectively).
- 1988 eighth graders in the middle two and highest socioeconomic quartiles were less likely to report not doing any volunteer work as of 1994 than those in the lowest 1992 socioeconomic quartile (Table 4-3) (68 percent and 48 percent to 77 percent).
- 1988 eighth graders who were high school graduates or had a GED or equivalent by 1994 were less likely to report having done no volunteer work as of 1994 than those who were dropouts (Table 4-3) (62 percent and 74 percent to 87 percent respectively).
- 1988 eighth graders who, in 1992, expected to finish college or earn a graduate degree were less likely to report not having volunteered in any organizations as of 1994 than those who expected to complete high school or less or to go to trade school (Table 4-3) (60 percent and 50 percent to 82 percent and 79 percent, respectively).

Voting Patterns

- 1988 eighth grade men were more likely than 1988 eighth grade women to report being registered to vote as of 1994 (Table 4-4) (71 percent to 65 percent).
- A greater percentage of 1988 eighth graders who attended Catholic high schools reported being registered to vote in 1994 than those who attended public high schools (Table 4-4) (78 percent to 69 percent respectively).
- A higher percentage of 1988 eighth graders who attended public four-year postsecondary education institutions than those who attended private for-profit institutions reported voting in their last local or state election (Table 4-4) (40 percent to 26 percent).
- 1988 eighth graders in the middle two and highest 1992 socioeconomic quartiles were more likely to report being registered to vote as of 1994, voting in the 1992 presidential election, and voting in their last local or state election than those in the lowest 1992 quartile (Table 4-4) (68 percent and 79 percent to 57 percent respectively for voter registration comparisons; 47 percent and 61 percent to 27 percent for 1992 presidential election voting comparisons; and 32 percent and 38 percent to 20 percent for last local or state election voting comparisons).
- 1988 eighth grade blacks and whites were more likely to report being registered to vote as of 1994 than Asians/Pacific Islanders (Table 4-4) (66 percent and 72 percent to 48 percent respectively).
- 1988 eighth grade blacks and whites were more likely to report voting in the 1992 presidential election than Asians/Pacific Islanders or Hispanics (Table 4-4) (38 percent and 51 percent to 27 percent and 29 percent).
- 1988 eighth graders who were high school graduates by 1994 were more likely to report being registered to vote as of 1994, voting in the 1992 presidential election, and voting in their last local or state election than those who were dropouts or had a GED or equivalent in 1994 (Table 4-4) (72 percent to 49 percent and 56 percent respectively for voter registration comparisons; 51 percent to 17 percent and 30 percent respectively for 1992 presidential election voting comparisons; and 34 percent to 10 percent and 23 percent respectively for last local or state election voting comparisons).

Appendices

Appendix A: Technical Notes

Appendix A

Technical Notes

The National Education Longitudinal Study of 1988: Overview

The major features of the National Education Longitudinal Study of 1988 (NELS:88) include the integration of student, dropout, parent, teacher, and school studies; initial concentration on a 1988 eighth grade student cohort to be followed over a period of ten years; the inclusion of supplementary components to support analyses of geographically or demographically distinct subgroups; and design linkages to previous longitudinal studies and other current studies.

The Base Year of NELS:88 represented the first stage of a major longitudinal effort designed to provide trend data about critical transitions experienced by students as they leave elementary school and progress through high school and into postsecondary institutions or the work force. This study of the 1988 eighth grade cohort collected data about educational processes and outcomes pertaining to student learning, predictors of dropping out, and school effects on students' access to programs and equal opportunity to learn.

The First Follow-up in 1990 provided the first opportunity for longitudinal measurement of the 1988 baseline sample. It also provided a comparison point to high school sophomores 10 years before, as studied in HS&B. (The NELS:88 sample was freshened in the First Follow-up to represent the tenth grade class of 1990.) The study captured the population of early dropouts (those who leave school between the end of eighth grade and the end of tenth grade), while monitoring the transition of the student population into secondary schooling.

The Second Follow-up took place in 1992, when most sample members entered the second term of their senior year. The Second Follow-up provides a "capstone" measurement of learning in the course of secondary school, and also collects information that will facilitate investigation of the transition into the labor force and postsecondary education after high school. (Freshening the NELS:88 sample to represent the twelfth grade class of 1992 makes trend comparisons with the senior cohorts that were studied in NLS-72 and HS&B possible.) In addition to surveying the students who were in school during the First Follow-up, the NELS:88 Second Follow-up resurveyed students who were identified as dropouts in 1990, and identified and surveyed those additional students who left school after the First Follow-up.

The Third Follow-up took place in the spring of 1994, when most sample members had been out of high school for two years. The 1994 data collection was designed to meet four general requirements for information about American education. These can be characterized as looking backward within the cohort(s) to understand the impact of prior experiences on current circumstances, looking ahead to provide a basis for understanding cohort members' future experiences, looking within the cohort at a single point in time to compare the outcomes and experiences of different social groups, and looking across cohorts by comparing the experiences of the NELS:88 cohort(s) with cohorts separated by one or two decades. Major content areas for the Third Follow-up questionnaire were: education histories; work experience histories; work related training; family formation; opinions and other experiences; occurrence or nonoccurrence of significant life events; and income. The NELS:88 fourth follow-up is slated for 2000.

Sample Weighting

The general purpose of weighting survey data is to compensate for unequal probabilities of selection and to adjust for the effects of nonresponse. Weights are often calculated in several steps. In the first step, unadjusted weights are calculated as the inverse of the probabilities of selection, taking into account all stages of the sample selection process. In the second step, these initial weights are adjusted to compensate for unit nonresponse; such nonresponse adjustments are typically carried out separately within multiple weighting cells. These steps were followed in creating the NELS:88 Third Follow-up weights.

In order to maintain consistency in weights across the various waves and across the various weights within wave, multidimensional raking was also applied when creating NELS:88 weights. In the Third Follow-up, raking

was performed with respect to base year school characteristics, race, sex, and status in each of the rounds.

The estimates in this report for the 1988 eighth grade cohort were produced using the 1994 questionnaire weight subsetting for 1988 eighth grade sample members (F3QWTG8).

Survey Standard Errors

Because the NELS:88 sample design involved stratification, the disproportionate sampling of certain strata, and clustered (i.e. multi-stage) probability sampling, the resulting statistics are more variable than they would have been had they been based on data from a simple random sample of the same size.

The calculation of exact standard errors for survey estimates can be difficult and expensive. Frequently used statistical analysis packages such as SPSS (Statistical Program for the Social Sciences) or SAS (Statistical Analysis System) do not adjust for complex sampling designs of the type used in NELS:88 in the calculation of standard errors. Several procedures are available for calculating precise estimates of sampling errors for complex samples. Procedures such as Taylor Series approximations, Balanced Repeated Replication (BRR), and Jackknife Repeated Replication (JRR) produce similar results.<2> Consequently, it is largely a matter of convenience which approach is taken. For NELS:88, NORC used the Taylor Series procedure to calculate the standard errors. The standard errors for this report were calculated using the Data Analysis System (DAS) developed by NCES. Table A-1, which shows the standard errors for table 4 in the essay, provides an example of the standard errors calculated by the DAS and used in the analyses for this report.

Table A-1 Standard errors for percentage of 1988 eighth graders in 1992 tested achievement quartile groups, by various characteristics

	Lowest quartile	Middle two quartiles	Highest quartile
Total	0.74	0.71	0.75
Sex			
Male	1.06	1.04	1.00
Female	0.88	0.97	0.92
Race/ethnicity			
Asian/Pacific Islander	2.86	2.97	2.70
Hispanic	2.06	2.00	1.22
Black	2.35	2.33	1.15
White	0.73	0.84	0.87
Socioeconomic status (1992)			
Lowest quartile	1.68	1.64	0.58
Middle two quartiles	0.84	0.88	0.77
Highest quartile	1.11	1.35	1.44

Data Analysis System

The estimates presented in this report were produced using the NCES Data Analysis System (DAS) for the NELS:88 Third Follow-up. The DAS software makes it possible for users to specify and generate their own tables from the NELS:88 data. With the DAS, users can recreate or expand upon the tables presented in this report. In addition to the table estimates, the DAS calculates appropriate standard errors and weighted sample sizes for the estimates.<3> If the number of valid cases is too small to produce an estimate, the DAS prints the message “low n” instead of the estimate.

In addition to the tables, the DAS will also produce a correlation matrix of selected variables that can be used in linear regression models, and the design effects (DEFT) for all the parameter estimates in the correlation matrix. Since statistical procedures generally compute regression coefficients based on simple random sample assumptions, the standard errors must be adjusted with the design effects to take into account the complex sampling procedures used in the NELS:88 surveys. For more information about the NELS:88 Third Follow-up DAS, contact:

Statistical Procedures

Comparisons that have been drawn in the text of this report have been tested for statistical significance to ensure that the differences are larger than those that might be expected due to sampling variation. The statistical comparisons in this report were based on the *t* statistic. Generally, whether the statistical test is considered significant or not is determined by calculating a *t* value for the difference between a pair of means or proportions and comparing this value to published tables of values at certain critical levels, called "alpha levels." The alpha level is an *a priori* statement of the probability that a difference exists in fact rather than by chance.

To guard against errors of inference based upon multiple comparisons, the Bonferroni procedure⁴ to adjust significance tests for multiple contrasts was used. This method corrects the significance (or alpha) level for the total number of contrasts made with a particular classification variable. For each classification variable, there are $(K*[K-1])/2$ possible contrasts (or nonredundant pairwise comparisons), where *K* is the number of categories. For example, if a classification variable such as race has five categories, *k*=5 and there are $(5*4)/2=10$ possible comparisons between the categories. The Bonferroni procedure divides the alpha-level for a single *t*-test (in this case, 0.05) by the number of possible pairwise comparisons (10) to derive a new alpha corrected for the fact that multiple contrasts are being made. For all of the tables in this report, the Bonferroni adjustment is applied on a variable by variable basis, adjusting for the number of possible comparisons among the subgroups defined by a single row variable.

The *t* statistic between estimates from various subgroups presented in the tables can be computed by using the following formula:

$$t = (X1-X2)/\text{SQRT}(SE1^2+SE2^2)$$

where *X1* and *X2* are the estimates to be compared and *SE1* and *SE2* are their corresponding standard errors.

Nonresponse Bias Analysis

Comparisons were made between subgroups defined on the basis of whether the respondent had complete data for the critical variables used in this report. The purpose of this analysis is to assess whether there is a significantly greater proportion of missing cases in a particular subgroup which might account for apparent between group differences.

A case was classified as "valid" for a given variable if the respondent had an in-scope response code (including "don't know"), and as "missing" if the response code corresponded to "missing" or "refused." Respondents classified as "legitimate skip" for a given variable were excluded from the analysis of that variable. The distribution of valid and missing cases was broken down by sex, race/ethnicity, socioeconomic status, school type, and 1994 diploma status.

The nonresponse bias analysis was conducted for 15 critical variables used in the Descriptive Summary Report and was based on all NELS:88/94 respondents. The complete results can be found in Section 5.6 of the NELS:88/94 Methodology Report.

The results shown in Table A-2 below illustrate this analysis. The analysis is accomplished by comparing the percentage "missing" to the percentage "valid" for a given subgroup. For example, for months unemployed in 1993 (UNEMPL93), public school students constitute a greater percentage of the missing group (97.5 compared to 91.1). The same is true for low SES respondents (41.7 percent compared to 24.5 percent) and for dropouts (20.8 percent compared to 7.3 percent). A higher percentage of valid respondents is accounted for by Catholic school students and students of "other private" schools (this pattern was observed for a several of the variables in the nonresponse bias analysis); the same was true for whites, respondents with diplomas, and high SES respondents. None of the other comparisons in this table are statistically significant. The differences observed in the nonresponse bias analysis in, for example, 1992 high school sector, may indicate that differences in unemployment between subgroups defined on high school sector may be due, at least in part, to differential response rates.

Table A-2 Bias analysis for months unemployed in 1993

	Percent valid	Standard error for valid	Percent missing	Standard error for missing	t-value<a>
Total	99.1	0.11	0.9	0.11	
Sex					
Male	50.6	0.63	55.9	5.78	-0.90
Female	49.4	0.63	44.1	5.78	0.90
Race/ethnicity					
Asian/Pacific Islander	3.9	0.30	3.7	1.27	0.20
Hispanic	11.3	0.83	14.3	3.47	-0.83
Black	13.6	0.81	28.3	5.65	-2.58
White	69.7	1.18	50.7	5.99	3.12
High school sector					
Public	91.1	0.64	97.5	1.09	-5.10
Catholic	5.1	0.40	1.8	0.96	3.13
Other private	3.8	0.50	0.6	0.50	4.51
High school diploma status (1994)					
High school diploma	81.1	0.66	58.4	5.62	4.01
GED or equivalent	6.3	0.41	9.4	2.45	-1.24
Working toward diploma	5.3	0.31	11.5	4.32	-1.41
Dropout	7.3	0.43	20.8	4.61	-2.92
Socioeconomic status (1992)					
Lowest quartile	24.5	0.77	41.7	5.82	-2.93
Middle two quartiles	50.3	0.75	46.8	5.93	0.58
Highest quartile	25.2	0.91	11.5	3.84	3.47

Source: NCES, National Education Longitudinal Study: 1988-1994

<a> This t-value compares the percent valid to the percent missing for a given row variable.

Endnotes

- <1> The process referred to here as "freshening" added students who were not in the base year sampling frame, either because they were not in the country or because they were not in eighth grade in the spring term of 1988. The 1990 freshening process provided a representative sample of students enrolled in tenth grade in the spring of 1990. The 1992 freshening process provided a representative sample of students enrolled in twelfth grade in the spring of 1992. Section 3.3.3 of Ingels et al. (*NELS:88 Second Follow-up Student Component Data File Users' Manual*) provides a detailed description of the freshening process.
- <2> Frankel, M.R., *Inference from Survey Samples: An Empirical Investigation* (Ann Arbor: Institute for Social Research, 1971).
- <3> The NELS:88 sample is not a simple random sample, and techniques for estimating standard errors that are appropriate for simple random samples will not produce accurate standard errors for these data. The DAS takes into account the complex sampling procedures and calculates standard errors that are appropriate for such samples. The method for computing sampling errors used by the DAS involves approximating the estimator by the linear terms of a Taylor series expansion. This procedure is typically referred to as the Taylor series method.

Appendix B: Glossary

Glossary

This glossary describes the variables used in this report. The items were taken directly from the National Education Longitudinal Study: 1988-1994 Data Analysis System (DAS), a NCES software application that generates tables directly from the data files.

The variables and definitions are divided into five categories: demographic and status variables, postsecondary education variables, labor force experience variables, family experience variables, and civic participation, values, and personal time variables.

Personal Characteristics

Sex (F3SEX)

Female
Male

Race/ethnicity (F3RACE)

Asian or Pacific Islander	A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or Pacific Islands. This includes people from China, Japan, Korea, the Philippine Islands, Samoa, India, and Vietnam.
Hispanic regardless of race	A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.
Black not of Hispanic origin	A person having origins in any of the black racial groups of Africa, except those of Hispanic origin.
White not of Hispanic origin	A person having origins in any of the original peoples of Europe, North Africa, or the Middle East (except those of Hispanic origin).

Current marital status (F3MARST)

Single, never married	Respondent had never been married.
Married	Respondent was married at the time of the interview.
Divorced/separated/widowed	Respondent had been married but was either divorced or separated, or the spouse had died.
In marriage-like relationship	Respondent reported living with a partner but not being married.

Children (NUMCHILD)

None	No children born to the respondent
One or more	At least one child born to the respondent

Socioeconomic status in 1992 (F2SESIC)

The socioeconomic status (SES) index is a composite of five equally weighted, standardized components: father's education, mother's education, family income, father's occupation, and household items. The terms high, middle two, and low SES refer to the upper, middle two, and lower quartiles of the weighted SES composite index distribution.

Lowest quartile	Students in the first through 24th percentile
Middle two quartiles	Students whose percentile rank ranged from 25 to 74 percent.
Highest quartile	Students whose percentile rank ranged from 75 to 99 percent.

Financial support for others (AMTSUPRT)

Respondents were asked if they contributed to anyone else's support, such as grandparents, aunts or other relatives, regardless of whether they currently lived with that relative. Respondents were also asked to estimate this contribution annually.

No	No financial support for others
Yes	Financial support for at least one other.

Alcohol consumption during lifetime in 1992 (F2S81A)

Respondents were asked in 1992 to report their lifetime consumption amount for alcohol.

- No occasions
- One or two occasions
- Three to nineteen occasions
- Twenty or more occasions

Cocaine or crack use during lifetime in 1992 (F2S84A)

Respondents were asked in 1992 to report their lifetime consumption amount for cocaine.

No occasions
One or two occasions
Three to nineteen occasions
Twenty or more occasions

Family characteristics

At risk of school failure factors in 1988 (BYATRISK)

This variable measures how many of the "at risk of school failure" factors were present for the sample members in 1988. The factors include: parent is single, parent has no high school diploma, limited English proficiency, income less than \$15,000, sibling dropped out of high school, and home alone more than three hours a day.

None	No risk factors
One	One risk factor present
Two or more	Two or more risk factors present

Education level of father as of 1992 (F2N8A)

High school or less	The highest level of education completed by the father was a high school diploma or equivalent or less.
Trade school after high school	Father attended trade school after high school
College after high school	Father attended college after high school.
Finished college	Father attained a college degree.
Graduate degree	Father attained a graduate degree.
Do not know	Respondent did not know father's educational background.

Education level of Mother as of 1992 (F2N8B)

High school or less	The highest level of education completed by the mother was a high school diploma or equivalent or less.
Trade school after high school	Mother attended trade school after high school.
College after high school	Mother attended college after high school.
Finished college	Mother attained a college degree.
Graduate degree	Mother attained a graduate degree.
Do not know	Respondent did not know mother's educational background.

Education Variables

Last high school program type (F3HSPROG)

Three types of programs are distinguished: academic, vocational, and "other." An academic program is designed to prepare students for continued study at a four-year college or university. A vocational program is designed to prepare students for employment in one or more semi-skilled, skilled, or technical occupations. Programs classified as "other" are designed to provide students with the understanding and competence to function effectively in society and usually represent a mixture of academic and vocational components. Also included in this classification are personal use programs which provide students with general skills in areas such as health, religion, and military science. For the purposes of NELS:88/94, the last two categories have been combined into a "vocational/other" category.

The variable F3HSPROG (Last high school program type) was derived from the 1992 transcript data when available. Otherwise, the self-reported high school program type was used.

Academic	Academic program type
Vocational/Other	Vocational or "other" program type

High school sector (F2SCHTYP)

Public	An educational institution whose programs and activities are operated by publicly elected or appointed school officials and which is supported primarily by public funds.
Catholic	A private school over which a Roman Catholic church group exercises some control or provides some form of subsidy. Catholic schools for the most part include those operated or supported by: a parish, a group of parishes, a diocese, or a Catholic religious order.
Other private	An educational institution controlled by a private individual(s) or by a nongovernmental agency, usually supported primarily by other than public funds, and operated by other than publicly elected or appointed officials.

1994 High school status (F3DIPLOM)

1994 Graduate	Students who received formal recognition for the successful completion of a prescribed program of studies before the 1994 data collection.
Dropout	Students are not in school and are not graduates.
GED or equivalent	Students who obtained certification of high school equivalency by meeting state requirements and passing an approved exam, which is intended to provide an appraisal of the person's achievement or performance in the broad subject matter areas usually required for high school graduation.
Enrolled in high school	Students who have not yet completed a high school diploma, GED, or equivalent, and were actively enrolled in high school.
Working towards equivalency	Students who have not yet completed a high school diploma, GED, or equivalent, and were actively engaged in the pursuit of a GED or equivalent certificate.

1992 Test quartile (F22XCEN)

The source for this variable was the composite variable consisting of math and reading NELS Second Follow-up test scores. To create the derived variable, a ranking was created by first calculating a weighted frequency distribution of test composite variables. Next, cutoff points were determined and numbered sequentially from 1 to ninety-nine. The first cutoff point defined the lowest 1.5 percent of the population. Each subsequent cutoff point defined an additional 1 percent. The final cutoff point (assigned the value of 99) determined the last 1.5 percent of the population.

For the purposes of this report, centile values were converted to quartiles. This set of cutoffs was intended to produce an approximately symmetric division of the sample, with 50 percent in the middle grouping and 25 percent in the upper and lower tails of the distribution. The actual breakdown deviates from this intention for two reasons. First, the underlying centile scores are expressed as integer values. Thus, any regrouping into quartiles will only be approximate. Second, the centile ranking was constructed using the Second Follow-up questionnaire weight. Thus, analyses using the Third Follow-up sample and weight will also produce a degree of asymmetry when quartiles are defined. Nonetheless, the observed deviation was not dramatic, resulting in a lower quartile that is slightly more exclusive (23.4 percent) and an upper quartile that is slightly more inclusive (26.5 percent).

Lowest quartile	Students whose percentile rank ranged from 1 to 24 percent.
Middle two quartiles	Students whose percentile rank ranged from 25 to 74 percent.
Highest quartile	Students whose percentile rank ranged from 75 to 99 percent.

Type of First Institution (F3SEC2A1)

Private for profit	A private for-profit institution is a postsecondary institution that is privately owned and operated as a profit-making enterprise. Includes career colleges and proprietary institutions.
Private not-for-profit less than 4-year	A private not-for-profit institution offering a less-than-four-year degree and controlled by an independent governing board and incorporated under section 501(c)(3) of the Internal Revenue Code.
Public less than 2-year	A public less-than-two-year (vocational-technical) postsecondary institution is supported primarily by public funds and operated by publicly elected or appointed officials who control the school's program and activities.
Public 2-year	A public institution offering a two- to three-year degree (i.e., associate's degree).
Private not-for-profit 4-year	A private not-for-profit college or university offering bachelor's degree or higher.
Public 4-year	A public college or university offering a bachelor's degree or higher.

First postsecondary education intensity and timing (PSEBEGST)

This variable was constructed from respondents answers about their level of enrollment when they began their postsecondary studies at their first institution.

Full-time before 9/92
Part-time before 9/92
Full-time 9/92-8/93
Part-time 9/92-8/93
Full-time after 8/93
Part-time after 8/93

Valid postsecondary education institutions attended (F3PSENUM)

This variable counts the number of postsecondary institutions named by the respondents excluding military training programs.

None
One
Two or more

Highest level of education expected in 1988 (BYS45)

Highest level of education expected in 1992 (F2ASPIRE)

Highest level of education expected in 1994 (EDEXPECT)

This set of variables was coded as follows:

High school or less Student expected to complete high school or less.

Trade/vocational Student expected to complete trade or vocational school.

Some college Student expected to complete some college.

Finish college Student expected to attain a bachelor's degree.

Graduate degree Student expected to attain a graduate degree.

Do not know Student was unsure of expectations.

However, for the purposes of the essay on access and choice, the categories were recoded (lumped) as follows:

High school or less Student expected to complete high school or less.

Trade/vocational Student expected to complete trade or vocational school.

Some college Student expected to complete some college.

Bachelor's or more Student expected to attain at least a bachelor's degree.

Employment Variables

Labor force status in 1993 (LABFOR93)

Traditional postsecondary education student	Respondent was a student in a postsecondary institution during the traditional school months (i.e., not including the summer months).
Part-time student	Respondent was a student not employed during part but not all of the school year and was not employed during the year.
Primarily postsecondary education student, also employed	Respondent was both a student during part of the school year and employed during the year but indicated that he or she was primarily a student.
Primarily employed, also student	Respondent was both a student during part of the school year and employed during the year but indicated that he or she was primarily employed.
Employed six months or more	Respondent was employed for at least six months and not a student during the year.
Employed one to five months	Respondent was employed for at least one and less than six months and not a student during the year.
Unemployed	Respondent was not a student and unemployed or out of the work force throughout the year.
Out of work force	Respondent was not a student and out of the labor force (i.e., never unemployed) throughout the year. This category includes homemakers and discouraged workers who are not looking for work.

To define populations for analysis in section 2 of the table compendium, the above categories were combined as follows:

Employed in 1993	Includes respondents in the categories: primarily employed, also student; employed six months or more; and employed one to five months.
In labor force in 1993	Includes respondents in the categories: primarily employed, also student; employed six months or more; employed one to five months; and unemployed.

Industry of longest held 1993 job (INDCODE2)

To arrive at these categories, respondents' verbatim answers were coded during the interview using abbreviated industry codes.

Agriculture or forestry
Mining
Construction
Manufacture of durable goods
Manufacture of nondurable goods
Transport or communication or utility
Wholesale trade
Retail trade
Finance or insurance or real estate
Business and repair services
Personal services
Entertainment or recreation
Professional and related services
Public administration
Military

Total earnings from jobs in 1993 (TOTLEAR2)

Respondents were asked how much they earned from all jobs they held between January and December 1993.

None	Respondent had no income in 1993.
Lowest quartile	Respondent's reported income percentile rank ranged from 1 to 24 percent.
Middle two quartiles	Respondent's reported income percentile rank ranged from 25 to 75 percent.
Highest quartile	Respondent's reported income percentile rank ranged from 76-99 percent.

Postsecondary Education Variables

Number of applications to postsecondary institutions (NUMAPL)

Zero	Student applied to no postsecondary education institutions.
One	Student applied to one postsecondary education institution.
Two or more	Student applied to two or more postsecondary education institutions.

Importance of college expenses (F2S59A)
Importance of financial aid (F2S59B)
Importance of attending college and living at home (F2S59F)
Importance of low crime environment (F2S59I)
Importance of college reputation (F2S59L)

For the preceding five variables, students were asked to rate each for how important a consideration it was in choosing a postsecondary institution. Response categories included "not important," "somewhat important," and "very important." For the purposes of this report these ratings were collapsed into "very important" and "less than very important."

Very Important	Student responded this factor was very important in choosing a postsecondary institution.
Less than very important	Student responded this factor was "somewhat important" or "not important" in choosing a postsecondary institution.

Number of postsecondary institutions attended (NUMATND1)

This variable was derived from respondents' answers about attendance spells at their first postsecondary education institution. If no attendance spells were reported for this "first institution," the respondent was coded as never having attended a postsecondary institution. If there was at least one attendance spell, then the respondent did attend a postsecondary institution at least once. Note that this variable does not index the duration of the attendance spell(s), nor does it index the number of institutions a respondent attended.

No postsecondary education	No attendance spells at first PSE institution
One postsecondary institution	One or more attendance spells at first PSE

In state at first postsecondary institution (PSEFIRIO)

In state	Student attended first postsecondary institution in home state.
Different state	Student attended first postsecondary institution outside of home state.

Still at first institution (F3STILL)

This variable was derived from respondents' answers about start and end dates at first postsecondary institution.

Not still enrolled in first institution
Still enrolled in first institution

Enrollment status (ENRLSTA1)

Full-time	Student was enrolled in postsecondary institution full-time.
Half-time	Student was enrolled in postsecondary institution half-time.
Less than half-time	Student was enrolled in postsecondary institution less than half-time.

Labor Force Experience Variables

Number of jobs held in 1993 (NUMJOBS2)

Respondents who indicated they were employed in 1993 were asked to enumerate the number of jobs they had held. For the tables presented in this report, means were calculated.

Months unemployed in 1993 (UNEMPL93)

Respondents who indicated they were unemployed in 1993 were asked to enumerate the number of months they were unemployed. For certain tables presented in this report, means were calculated.

1994 expectations for job at age 30 (OCCFUTCD)

Respondents were asked to describe their job expectations at age 30 and their responses were recoded into the following occupation codes.

- Clerical
- Craftsman
- Farmer or farm manager
- Laborer
- Manager/administrator
- Military
- Skilled operative
- Professional
- Proprietor
- Protective service
- Sales
- School teacher
- Service
- Technical
- Homemaker/not working outside home
- Do not know

Expected income at age 30 (EXPTINCM)

Respondents were asked what income they expected to earn by age 30. For the tables presented in this report, averages were calculated.

Employer Provided Benefits and Training Opportunities Variables

For each of the following, respondents were asked whether the job they held the longest in 1993 offered the indicated benefit or training opportunity (response categories for all, Yes/no).

Medical benefits (EMPBMED)
Dental benefits (EMPBDENT)
Life insurance (EMPBLIFE)
Sick days with pay (EMPBSICK)
Paid vacation (EMPBVAC)
Paid maternity or paternity leave (EMPBLEAV)
Unpaid maternity or paternity leave (UNPDLEAV)
Pension plan (EMPBPENS)
Child care assistance (EMPBCHLD)
Unpaid leave to care for others (UNPADOTH)
On-site formal training received (EMPTRAN1)
Informal on-the-job training received (EMPTRAN2)
Off-site formal training received (EMPTRAN3)
Employer-provided tuition assistance received (EMPTRAN4)

Total weeks training was attended in 1993 (NUMWKSTN)

Respondents were asked to count the total number of weeks they spent in training in 1993.

Hours per week training was attended in 1993 (HRSPWKTR)

If respondents attended training in 1993, they were asked to report the average number of hours per week they spent in this training.

Employee Satisfaction Variables

Respondents were asked to indicate their satisfaction with the following variables using the following response categories: very satisfied, somewhat satisfied, not satisfied.

Pay and benefits (PAYFRNGE)
Importance (IMPRTCHA)
Working conditions (WRKCNDT)
Opportunity for advancement (OPROMOT)
Opportunity to use education (OUSTRAIN)
Job security (JOBSECTY)
Opportunities for education (FURTHERD)

Family Characteristics Variables

Age of first child (DOBCHL1)

This variable was derived from the respondents' answers about the month and year their first child was born.

Less than 12 months
From 12 months to 23 months
From 24 months to 47 months
48 months or older

Sexual Experience Variables

First sexual intercourse (FIRSTSEX)

Respondents were asked about their first sexual intercourse. The categories were derived from questions about year, month, and age.

Date unknown	Respondents indicated they did not know the date of their first sexual intercourse.
Never	Respondents indicated they had never engaged in sexual intercourse.
Before high school	Respondents whose first sexual intercourse occurred before they enrolled in high school.
During high school	Respondents whose first sexual intercourse occurred while they were enrolled in high school.
After high school	Respondents whose first sexual intercourse occurred after attending high school.

Use of birth control during first sexual intercourse (USEBIRCN)

Respondents who had sexual intercourse by the time of the 1994 interview were asked whether they used birth control during their first sexual intercourse to prevent pregnancy or sexually transmitted disease.

Did not use birth control	Respondent reported not using birth control during first sexual intercourse.
Did use birth control	Respondent reported using birth control during first sexual intercourse.

Use of birth control during last sexual intercourse (BCIM1)

Respondents who had sexual intercourse by the time of the 1994 interview and were not married were asked whether they used birth control during their last sexual intercourse to prevent pregnancy or sexually transmitted disease.

Did not use birth control	Respondent reported not using birth control during last sexual intercourse.
Did use birth control	Respondent reported using birth control during last sexual intercourse.

Civic Participation Variables

Number of volunteer organizations (F3VOLUNT)

Respondents were given examples of volunteer organizations and the number of organizations at which the respondents indicated having volunteered over the past year was coded.

None
One
Two
Three
Four or more

Personal Values

Respondents were asked to indicate how important the following variables were using the scale: very important, somewhat important, not important.

Professional employment success (SUCSLWRK)
Having a lot of money (LOTSMONEY)
Having strong friendships (STRGFRND)
*Providing children with a
better opportunity (CHLDOPTY)*
Being able to find steady work (STDYWORK)

For the purposes of this report these ratings were collapsed into "very important" and "less than very important."

Very Important Student responded this factor was very important.

Less than very important Student responded this factor was "somewhat important" or "not important."

Personal Time Variables

Respondents were asked to indicate whether in an average week they participated in the following activities one or more times.

Working on hobbies (HOBBIES)
Participating in sports (PARSPORT)
Reading for pleasure (READING)
Religious activities (RELIGION)
Talking to or doing things with parents (TALKPARN)
