Foreword

Each year a large number of written documents are generated by NCES staff and individuals commissioned by NCES which provide preliminary analyses of survey results and address technical, methodological, and evaluation issues. Even though they are not formally published, these documents reflect a tremendous amount of unique expertise, knowledge, and experience.

The *Working Paper Series* was created in order to preserve the valuable information contained in these documents and to promote the sharing of valuable work experience and knowledge. However, these documents were prepared under different formats and did not undergo vigorous NCES publication review and editing prior to their inclusion in the series. Consequently, we encourage users of the series to consult the individual authors for citations.

To receive information about submitting manuscripts or obtaining copies of the series, please contact Suellen Mauchamer at (202) 219-1828 or U.S. Department of Education, Office of Educational Research and Improvement, National Center for Education Statistics, 555 New Jersey Ave., N.W., Room 400, Washington, D.C. 20208-5652.

PREFACE

This publication is intended to facilitate research and policy analysis in rural education by linking substantive issues to the data resources of the National Center for Education Statistics (NCES). It is a long-awaited response to the needs for systematic data collection and data analysis regarding rural education.

The idea is simple: put significant research issues on rural education together with pertinent NCES data so that people can readily use the data to address the issues. The resulting Data User's Guide may work in two ways: to offer a handy tool for scanning NCES data that are presented with immediately applicable issues; and to stimulate, with our sample "bridges" between issues and data, further exploration for research applications of NCES data.

Section 1 is a brief review of NCES databases related to rural education, categorized as universe data and survey sample data. For each database, the review describes the background, research design, data contents, and computer equipment for accessing data. We give details about the measures of residential or school locale available from each dataset because of the measures' pivotal importance for identifying rural schools and communities.

In Section 2, policies on data access and technical services provided by NCES are described to help readers understand the procedure by which they can acquire access to the data.

The main body of this User's Guide is a research-issue-to-data listing which is presented in Section 3. According to the prioritized research agenda suggested by the Federal Interagency Subcommittee on Rural Education and the Appalachia Educational Laboratory, we present variable names/labels from one or more NCES datasets under specific concepts that are relevant to specific research issues. These issues are further categorized into six broad areas, including Effectiveness of rural schools, Curricular provisions in rural schools, School and community partnerships, Human resources for rural schools, Use of technology for rural schools, and Financial support for governance for rural schools. While different locale codes are described in the database review of Section 1, Section 3 presents specific variable names/labels under the heading "Rural-urban definition", for each dataset, in connection with each specified research issue.

For reader's reference, Appendix A provides excerpts from each of four major locale classification schemes used by federal agencies, namely, the U.S. Census Bureau, the Office of Management and Budget, the National Center for Education Statistics, and the U.S. Department of Agriculture. We also append information about Census data resources that may be applied to rural research, the procedures for accessing NCES restricted use data, some key issues on survey data analysis as discussed in an NCES technical report of a survey, and a listing of acronyms of NCES projects and databases.

It is hoped that this User's Guide will help users of NCES data in rural education, including researchers, practitioners, policymakers, and professional organizations and funding agencies, to well employ the NCES data resources to address various concerns related to rural education.

We thank Dr. E. Robert Stephens and Dr. John R. Sanders for their helpful review of this publication.

Introduction

Information specifically collected for studying rural education in America is scant (Haas, 1992; Stern, 1994). However, national data collected by the National Center for Education Statistics (NCES) are a valuable information resource for rural education research and decision-making. NCES data collections contain rich information on students, teachers, schools, families, and communities. For example, the datasets often contain measures of urbanicity of the community which is critical to rural studies, making possible the rural-urban comparative analysis or rural-focused analysis. While sharing many concerns with their urban colleagues, rural educators may have different priorities in the information needs. Moreover, rural educators do work in a community circumstances that is distinct from other places. NCES data resources are promising for rural research. The data allow analysts to address various issues that concern rural education researchers and practitioners, as well as decision-makers; and also to address essential issues which affect in both rural and urban areas but take on their own characteristics in rural locales.

Purpose and Approach

This publication is intended to help researchers, practitioners, and policy makers in rural education to use NCES data resources. It links substantive issues on rural education to specific NCES datasets and variables. We emphasize an issue-oriented, rather than data-driven, approach. We first identify important research and policy issues from existing rural education agendas which have been articulated by scholars and practitioners in rural education. Two publications provide systematic information for our effort to identify research/policy issues. One is a booklet on rural research issues published by the Federal Interagency Committee on Education (FICE, 1989); the other is a recent report by the Appalachia Educational Laboratory on its study of rural educators' prioritization of research and policy issues (AEL, 1994). Our literature review and own observations also influenced the determination of rural issues. These issues are pressing and can be addressed with national data available at NCES.

For a number of uniquely significant rural education issues such as community-based curriculum, community involvement in schooling, school consolidation, and distance education, as we found, there are few data available from NCES databases.

After the recognition of important research issues, we examined all the major NCES surveys to determine the relevance of the data to the issues. For each research issue, useful survey sample datasets are listed with specific variables for each dataset, grouped by the topic of the variables. The result is a vast list of research issues by datasets and variable groups. It is the major portion (Section 3) of this guide book.

For users getting to know about NCES data, we provide a brief description of NCES data collections that are useful for the study of elementary and secondary education in rural America (Davis & Sonnenberg, 1995, 1993).

Special Issues in Using NCES Data

Several issues need special attention for users of NCES data. First, most NCES surveys use complex sampling design. The sampling techniques frequently used include multistage stratified or clustered sampling. Differing from simple random sampling, these sampling approaches generate sample data for which the conventional statistical assumptions with simple random sampling are not necessarily warranted. Further, over-sampling of special groups (e.g., minority groups, private schools) is common in NCES surveys. Such over-sampling is intended to ensure adequate sub-sample size for focused analysis regarding these special groups. Thus analysis of NCES data requires special efforts to correct potential bias resulted from the complex sampling. An appendix (Appendix D) is included to introduce to readers some basic concepts related to complex sampling survey analysis. For more detailed information and specific instructions for each NCES survey, users are referred to the technical report of the survey.

Second, confidentiality for individual respondents of a survey is required by law. To ensure confidentiality, NCES normally releases survey data in two versions, one for public use, another for restricted use. Information for identifying organizations and individuals in a survey is removed from the public use version but retained in the restricted version. Users who need to access the restricted version must execute an affidavit of nondisclosure with a notary public. Practical tips for accessing data and information on NCES's dissemination efforts through both telecommunication and traditional means (telephone, printed publications) are provided in Section 2 of this book.

Third, knowledge about NCES's dissemination and technical support services gives data users access to valuable resources. NCES has recently geared up its efforts in disseminating data and products on elementary and secondary education. An on-going series of seminars is conducted by NCES to help potential users to be familiar with data resources and related access techniques. The National Data Resource Center at NCES provides customized datasets and conducts requested tabulations for researchers and practitioners. Users may call or use electronic mail to request specific data requests or tabulations. These services are free of charge. The U.S. Department of Education has a World Wide Web and "gopher" server on the Internet where some NCES databases can be accessed. We discuss the various ways to access and use NCES data in Section 2.

Finally, an issue crucial to the use of national data for rural studies is the definition of rural-urban or metropolitan-nonmetropolitan categories. The definition and measurement of locales are an on-going debate among rural scholars and policy makers (Stephens, 1993). No universally adopted system is available. Specific research issues and research context are to be considered to conceptualize locales. Practically, several schemes developed by federal agencies provide workable categorizations of locales. To help users understand the conceptualization and measurement of rural-urban locales, we include four schemes of locale classification in Appendix A.

Section 1

NCES Databases

This section briefly describes each of the NCES databases that are useful for the rural education research. It gives readers an overview of NCES data resources. For detailed information on subject and technical aspects of the databases, readers are referred to the documentation for specific database.

There are two types of data in the NCES databases: universe data and survey data. Universe data cover the nation's school universe and provide such descriptive information as a school's mailing address, enrollment, program type, and demographic characteristics. Survey data do not actually cover the national population, but can yield estimates from nationally representative samples of schools or students. Often driven by specific policy issues of current concern, surveys collect detailed and dynamic information on schooling. We discuss NCES data within the two categories.

1.1 Universe Data

1.1.1 Common Core of Data (CCD)

The Common Core of Data (CCD) covers all public elementary and secondary schools and local and state education agencies. The data are collected annually. CCD is a key source for identifying and describing public elementary and secondary schools and school districts in the U.S. It can be used for selecting samples and descriptive statistical analysis. Currently, the CD-ROM version of CCD contains data for the five years prior to 1992. The 1992-93 data will be released in the near future.

Design: With five surveys sent to state education departments, CCD data are obtained from administrative records maintained by the state education agencies. Data are collected annually with specified format. The project covers approximately 87,000 public schools, 16,000 school districts, the 50 states, the District of Columbia, and other jurisdictions. CCD can be seen as a universe survey that covers all the members of the school/district population in the U.S.

Data: CCD contains the following information for schools and districts: descriptive data (name, address, phone number, and locale); demographic data on students and staff (enrollment by grade, the number of classroom teachers, and racial/sex composition); district-level data on high school completion; and district fiscal data (revenues by source and current expenditures by function and subfunction (not schools). For states, it contains aggregate data on enrollment by grade; full-time equivalent staff by employment category; high school completion and graduation, and fiscal data (revenues by source and expenditures by function and subfunction).

Rural-urban definition: Two codes are used for identifying locales, one for schools and one for local education agencies (LEA). For schools, NCES developed a seven-category scheme to determine the rural-urban locale (for the coding scheme, see Appendix A). The scheme takes both the population size and the distance to the nearest metro center to describe a school's locale. For LEAs, only three categories are involved: within a metro area but not in the central city, within a metro area and in the central city, and outside metro areas.

Access: Five years of CCD data beginning with school year 1986-87 through 1990-91 is available on a single CD-ROM. This represents approximately 425,000 school records, 85,000 agency records, and 280 state records. The CD contains data retrieval software for accessing and selecting specific subsets of data.

Hardware/Software Requirements: The minimal configuration to run this CD disc is an 80386 IBM or compatible PC with at least 640k of available memory and 3.5 Mb of free hard disk space, a CD-ROM reader, MS-DOS 3.0 or higher, and MS-DOS CD-ROM extensions version 2.01 or higher.

1.1.2 School District Data Book (SDDB)

The School District Data Book (SDDB) provides the most comprehensive data on the universe of school districts and communities (Herriot, 1992). It promises to be highly useful for policy analysis and program planning.

Design: Installed in a large set of CD-ROMs, the product is not from a single data collection project, but rather, a result of incorporating three federal data collection efforts: Census Bureau's 1990 decennial data, school administrative data from NCES's CCD, and financial data derived from the 1989-90 Census of Governments. With a software package, files and data elements with complicated structures are organized in a highly manageable manner for information presentation and analysis.

Data: The data cover 17,000 public school districts, geographically distributed in the 3,141 counties of the 50 states. SDDB is a promising resource for both research and program planning in rural education because it links rich sociodemographic data to school operation data. Census data comprise approximately 98 percent of the whole data amount. The data cover, among other things, family structure, age, sex, race, home language, employment, income, poverty status, dependence on public assistance, and rural-urban residence. Residence locales are classified with both the Census designation system and the NCES seven-category scheme.

In SDDB, school district boundaries are digitized into the Census Bureau's "TIGER" file (topologically integrated geographic encoding reference). SDDB can (1) provide education and demographic profiles of the nation, states, counties, and school districts; (2) tabulate information at the levels of the census geographies (state, county, city, and town), household, person, and child; and (3) thematically map educational and demographic conditions of the nation, states, counties, and districts, allowing relaying of various data manipulated by users.

Rural-urban definition: Both the scheme of the Bureau of Census and the NCES seven-category code (see Appendix A) are available from SDDB.

Access: The three uses correspond to three different levels of data processing/analysis, which require different levels of technical difficulty. On level 1, profile generating requires minimum training. Users can print or save resulting profiles/tables for further editing or analysis. On level 2, users can extract data from the SDDB master files into various formats, for analysis with other software. Level 3, the electronic atlas, allows users to produce customized maps with data derived from operations at level 1 or 2. The resulting thematic maps (e.g., a map of dropout data across district) can be saved as graphic files. The three levels of application interface with each other so that data manipulation and

graphic presentation are coordinated.

The School District Data Book system consists of a set of 43 CD-ROMs containing all of the data and software for the manipulation of the data, including the TIGER files for displaying and drawing district boundaries.

Hardware/Software Requirements: The minimal configuration to run this CD disc is an 80386 IBM or compatible PC with at least 640k of available memory and 1 Mb of free hard disk space, a CD-ROM reader, MS-DOS 3.0 or higher, and MS-DOS CD-ROM extensions version 2.01 or higher.

1.1.3 School District Analysis Book (SDAB)

The School District Analysis Book (SDAB) is an electronic analysis book on CD-ROM. It has the capability to produce a large collection of spreadsheets for the U.S. and each of the 50 states and the District of Columbia. The SDAB builds upon the same data used for the School District Data Book. The SDAB brings together a unique combination of data sources which include matching of the 1990 Census and the Common Core of Data (CCD), school district by school district.

Design: The SDAB system was designed to facilitate the query/analysis process. An interactive facility guides the researcher through the selection, viewing, and printing of any of the thousands of spreadsheets. This is accomplished through automatic selection (high-lighting) and disabling (graying out) of menu options used to construct the query. The system also guides the user throughout the necessary steps by displaying helpful information on the screen. The SDAB contains summary-level statistics across states and the U.S.

Data: The School District Analysis Book, a companion system to the School District Data Book, uses data from the 1990 Census, the Common Core of Data, and the Survey of School District Finances.

Rural-urban definition: Both the scheme of the Bureau of Census and the NCES seven-category code (see Appendix A) are available.

Access: The School District Analysis Book resides on one CD-ROM which contains both the data and software for generating spreadsheet analysis.

Hardware/Software Requirements: The minimal configuration to run this CD disc is an 80386 IBM or compatible PC with at least 640k of available memory and 1 Mb of free hard disk space, a CD-ROM reader, MS-DOS 3.0 or higher, and MS-DOS CD-ROM extensions version 2.01 or higher.

1.2 Survey Data

NCES conducts two types of surveys: longitudinal (following the same sample of respondents across years to see how education processes evolve among the sampled cohort) and cross-sectional (surveying different samples or cohorts to see the conditions at a given time). Most NCES surveys are conducted by group-administered questionnaires or mailed questionnaires (some with supplementary telephone or personal interviews) to stratified probability samples of schools or students.

1.2.1 National Longitudinal Study of the High School Class of 1972 (NLS72)

NLS72 was the first national longitudinal study of secondary schooling. It provided a prototype for developing later longitudinal surveys at NCES. NLS72 data can be used to study high school students' school-work transition process in the 1970's. If combined with data from the High School and Beyond and the National Educational Longitudinal Study 1988, NLS72 can be used for comparative analysis across cohorts.

Design: NLS72 studied a nationally representative sample of 12th graders enrolled in the 1971-72 school year, with four follow-up surveys conducted in 1974, 1976, 1979, and 1986. A two-stage probability sample was drawn in the base year. At the first stage, schools were sampled (with oversampling of schools in low income areas and schools with high minority enrollment); at the second stage 12th graders from each of the sampled schools were selected. The sample size varied from 16,683 in the base year to 12,841 in 1986. Data were collected by mail questionnaire, with some telephone and personal interview follow-up. Students' transcripts (courses/credits taken, grade point average, and standardized test scores) were obtained from school records.

Data: NLS72 contains information on students' sociodemographic backgrounds, SES conditions of family and community; school characteristics; education expectation of students and their families; school experience and performance; post-school employment, family life, and outmigration; access to financial assistance for and enrollment in post-secondary education; and attitudes related to education, work, family, and community.

Rural-urban definition: A series of variables in NLS72 represent the rural-urban locale of the respondents' schools or communities at the time of each wave of survey. The categories are: rural or farming community; small city or town of fewer than 50,000 people that is not a suburb; medium-sized city (50,000-100,000 people); suburb of a medium-sized city; large city (100,001 - 499,999); very large city (over 500,000 people); suburb of a very large city; and military base or station. Composite codes of locales are provided.

Related to the locale measures, at each wave of survey, two pieces of information were collected: (1) whether the respondent was living in the same place as in the last survey and (2) the distance between the two places. The data enable analysts to trace the rural-urban migration among students after they left high school.

Access: NLS72 data is available on CD-ROM through the Government Printing Office (GPO) for \$15. Data is accessible on mainframe tapes at the Boeing Computer System (BCS) with the appropriate user

account. Users with the proper access authorization can download all of the NLS72 data and an electronic code book for the data from the INET gopher server. See Section 2 for details.

Hardware/Software Requirements: For the CD-ROM version of the data, the minimal configuration to run this CD disc is an 80386 IBM or compatible PC with at least 640k of available memory and 1 Mb of free hard disk space, a CD-ROM reader, MS-DOS 3.0 or higher, and MS-DOS CD-ROM extensions version 2.01 or higher. For the mainframe, a PC with terminal emulation communications software is required for telecommunications access to the mainframe computer. For the data and code book downloaded from INET, approximately 5.5 Mb of hard disk will be required. The files are downloaded in compressed format (PKZIP) of size .8 Mb, but when decompressed need 5 Mb.

1.2.2 High School and Beyond Survey (HS&B)

HS&B is perhaps the most widely used survey data product made available by NCES. It was designed to address research and policy issues which arose in the 1980s, such as school dropout and vocational education. While the data coverage and the research design were similar to that of NLS72, HS&B surveyed the sophomore class in addition to the senior class.

Design: HS&B began in 1980 with four follow-ups in 1982, 1984, 1986, and 1992. Using stratified probability sampling design, HS&B selected 30,000 seniors and 28,000 sophomores in the base year, down to 1986's 12,000 and 15,000 for the two cohorts, respectively. The 1992-93 follow-up was only administered to the 15,000 sophomores cohort. Oversampled schools were: public schools with high enrollment of Hispanic students, Catholic schools with high enrollment of minority students, alternative schools, and private schools with high-achieving students. Parents of sampled students were also surveyed.

Survey instruments include several components: questionnaires and cognitive tests for students, school questionnaire responded to by school officials, teacher comment checklist responded by teachers of the sampled students, and parents' questionnaire.

Data: Following NLS72, HS&B studied high school experience and post-school life course of the 1980 senior and sophomore cohorts. In addition to information covered by NLS72 (see above), it addressed issues which arose in the 1980s, such as declining test scores, climbing dropout rates, bilingual education, vocational education, and access to post-secondary education. Because of the inclusion of the sophomore cohort who stayed in school longer than seniors, HS&B is enlightening for studying the dropout process and school effects such as curriculum offering and course taking. The dataset also is of much use in dealing with issues such as access to and completion of post-secondary education, job and career mobility, employment and earning-related schooling, and public and private school differences affecting students' academic performance and well-being in later life.

A file containing local labor market indicators (Kolstad et al., 1984) is available for merging with the HS&B file. This file contains 1980-1982 data on per capita income, wage, employment and unemployment, productivity, and other key measures in the metropolitan area (or corresponding nonmetropolitan area), state, and county. Records in this file are identified by the same school identification number in the HS&B file. Since rural education is highly sensitive to local economy changes, the merged dataset has great potential for analyzing the relationship between rural education

and community development. This valuable file has rarely been used in spite of HS&B's great utilization.

Rural-urban definition: The data files contain a series of variables indicating the locales of the respondent's school and community. For the school, the locale code includes three categories: rural, suburban, and urban. For the community, the code contains nine categories similar to that in NLS: rural or farming community; small city or town of fewer than 50,000 people that is not a suburb of a larger place; medium-sized city (50,000-100,000 people); suburb of a medium-sized city; large city (100,000-500,000 people); suburb of a large city; very large city (over 500,000 people); suburb of a very large city; and military base. Like NLS, additional data on respondents' migration distance from their home towns are available.

Access: The HS&B data prior to the 1992-93 followup are available on CD-ROM from the Government Printing Office. The latest version of HS&B with the last followup and all previous waves will be available on CD-ROM in 1995.

Hardware/Software Requirements: The minimal configuration to run this CD disc is an 80386 IBM or compatible PC with at least 640k of available memory and 1 Mb of free hard disk space, a CD-ROM reader, MS-DOS 3.0 or higher, and MS-DOS CD-ROM extensions version 2.01 or higher.

1.2.3 National Education Longitudinal Study (NELS:88)

The ongoing NELS:88 is a continuation of NLS72 and HS&B. To build upon the knowledge about the causes and consequences of secondary education success/failure, NELS:88 traces students' experience further than the former two projects by starting the base year survey with the 1988 cohort of eighth graders.

Design: Again, with two-stage stratified probability sampling, about 1,000 public and private schools were selected at the first stage, and 24-26 students per school were randomly selected at the second stage. Approximately 25,000 eighth graders and their parents, teachers, and school principals were surveyed in 1988. Hispanic and Asian students were oversampled. In addition to the longitudinal design, to accommodate the need for cross-section studies with data from each follow-up, the sample was "freshened" by selecting additional students into each follow-up sample. The resulting sample for the two follow-ups was representative of the national population of the 1988 eighth grader cohort.

Beginning with the 1988 base year survey, with the improved sampling strategies, NELS completed the second follow-up in 1992, and will continue by doing two more waves through 1996. The transition between eighth to tenth grade often involves massive school transferring among students. NELS successfully followed and retained in its sample more than 95 percent of the initially sampled students.

The survey consists of a student questionnaire and cognitive tests, a parent questionnaire, a teacher questionnaire (two teachers for each student), and a school administrator questionnaire. Dropout students were surveyed in the two follow-ups so that both early dropouts (between eighth and tenth grade) and later dropouts (between tenth and 12th grade) can be examined.

Data: Substantive issues covered by NELS are similar to those covered by HS&B. The data allow

investigation on the following issues concerning secondary education: tested achievement and cognitive growth; preparation for post-secondary education; curricular and extracurricular experiences; values, attitudes, and education/career goals; early and later dropouts; disadvantaged students, equity and risk factors; language minorities (Asians and Hispanics); and school effectiveness.

NELS:88 has a school-effects supplementary project which, based on a sample of 250 schools, collects data on the school level. This project meets the need for school-level analysis that the NELS:88 main survey cannot meet because its school sample was not representative to the national school population after the base year.

After the planned waves are completed, the resulting picture of schooling and socialization of youth in the 1990s may be more comprehensive than that produced by HS&B or NLS72. NELS:88 covers student life starting at an earlier stage (eighth grade as compared to tenth or 12th grades) and includes more information sources (e.g., two teachers per students, school administrators).

The three longitudinal projects are similar in sampling design, data collecting procedure, and measurement. They all include multiple files with data gathered from students, teachers, schools, and parents. The three projects, however, reflect changes in substantive foci and improvement in techniques. Together, they offer possibilities for understanding the life course of American youth in three decades, taking into account a host of individual, family, and school processes. Because of the general compatibility in measurement and research design, the three datasets may be used together to study trends across generations and time (NCES, in press).

Rural-urban definition: A three-category scheme with rural, suburban and urban locales.

Access: NELS:88 data is available on a single CD-ROM. The CD-ROM contains the following files:

- Base year student, parent, teacher, and public release files in ASCII format;
- First follow-up student, dropout, teacher, and school public release files in ASCII format;
- Second follow-up student file;
- Software for creating and operating the Electronic Code book;
- Base year and first follow-up User's Manuals; and
- ECB User Manual in ASCII and Wordperfect format

The data files are also accessible on the Boeing mainframe tapes for users with proper access and authorization.

Hardware/Software Requirements: To operate this ECB, the user should have an IBM compatible PC, MS-DOS 3.3 or higher, 50 Mb of available hard disk space, an 80386 or higher processor, PC SAS or PC SPSS software, and a CD-ROM reader. For the mainframe, a PC with terminal emulation communications software is required for telecommunications access to the mainframe computer.

1.2.4 School and Staffing Survey (SASS)

SASS is designed to study the operation of public and private schools and the conditions of the educational profession (teachers and administrators). Conducted in the 1987-88 and 1990-91 school years, the project will continue every three years in the future. Collecting information on schools, districts, teachers, and administrators, SASS claims to be the most comprehensive database for studying work force of teacher and administrators in both public and private schools.

Design: In addition to the cross-sectional design of school/district survey, the project includes a follow-up survey of a subsample of teachers one year after the main project SASS was completed. This feature makes SASS partly a longitudinal survey that can answer research questions related to teacher career path.

Schools are the basic sampling unit, with a sample of teachers in each sampled school. For public schools, the districts with which the sampled schools are affiliated are surveyed as well. The sampling of public schools takes schools in the Common Core of Data as the universe, stratified first by the state and then by the grade level (elementary, secondary, and combined). Schools with a large enrollment of Native Americans and Alaska Natives were oversampled in the 1990-91 SASS for special analysis of this group.

The private schools were selected from the NCES private school universe file, stratified by four Census regions, and within each region, by three grade levels similar to that for public schools.

Mail questionnaires with telephone follow-ups were used to collect information from teachers, school principals, and district administrators.

Data: SASS data consist of five components: (1) teacher file, containing information on teachers' demographic background, education and training, career history and plans, teaching assignment, working conditions, and perceptions of school climate and the teaching profession; (2) school administrator file, covering administrators' demographic and academic background, compensation and benefits, working experience and career goal, values and perceptions on education and school operation, and assessment of teaching staff quality; (3) school file, describing school programs, policies, operations, special programs, student and staff characteristics, teaching load, and teacher turnover; (4) district file, focusing on teacher supply and demand, policies on teacher salaries, compensation, retirement, hiring, and issues on teacher shortage and recruitment; and (5) teacher follow-up survey, addressing issues related to teacher attrition and retention issues, including data on teachers who stayed in the same schools or changed schools, and teachers who left the teaching profession, their job conditions, reasons for staying in or changing schools, and attitudes toward the teaching job.

Rural-urban definition: The NCES seven-category locale scheme was used in the 1990-91 SASS, based on census data on population size and distance to metro centers. A 10-category scheme was used in the 1987-88 SASS, based on school administrators' reports (See Appendix A for a comparison). Since the NCES seven-category code is available from the CCD file that served as the sampling universe, the NCES code can be merged into the 1987-88 SASS file as well.

Access: SASS data for the first cycle (1987-88) is available on a single CD-ROM. This CD has SASS data in SAS and SPSS format, as well as in flat ASCII files. The second cycle was released in July, 1994, and is similar to the NLS72 and NELS:88 CD-ROMs. It contains all of the SASS data and a menu-driven interface that generates SASS or SPSS code for data extraction, and displays some basic tabulations such as frequency distributions of variables. The public use CD-ROM is free, and may be obtained by contacting Sharon Bobbitt (202-219-1461) at NCES. The Restricted Use version is obtained by following the NCES licensing procedure in Appendix III. Contact Alan Moorehead (202-219-1920) at NCES. Data is also accessible on mainframe tapes at the Boeing Computer System (BCS) with the appropriate user account.

Hardware/Software Requirements: For the CD-ROM version of the data, the minimal configuration to run this CD disc is an 80386 IBM or compatible PC with at least 640k of available memory, a CD-ROM reader, MS-DOS 3.0 or higher, and MS-DOS CD-ROM extensions version 2.01 or higher. For the mainframe, a PC with terminal emulation communications software is required for telecommunications access to the mainframe computer.

1.2.5 National Assessment of Educational Progress (NAEP)

Started in 1969 and expanded dramatically in 1984 and thereafter, NAEP is a continuous project that periodically assesses student learning in various subjects at various age and grade levels. It is the single most comprehensive national source for assessing and monitoring secondary educational performance.

Design: A two-tiered sampling design is used to meet two competing goals in a survey, i.e., trend analysis of educational achievement and cross-sectional analysis on arising policy issues and new measurement techniques (Educational Testing Service, 1992). A new technique called balanced incomplete block spiraling has been used since 1984 to assign blocks of test items to subsamples of students. This method allows students to take a much smaller number of test items than does traditional survey, where all respondents respond to all items. The results from a large number of test items administered to different subsamples of students can be generalized to the population, thus a more efficient sampling process. This strategy has been further improved in 1990. Assessment is administered to students representing national and regional populations of ages nine, 13, and 17 or in grades four, eight, 11, and 12. Teachers and school administrators of the sampled students are also surveyed for instructional and school/community background information.

In 1990, a Trial State Assessment of mathematics was conducted with an additional sample of more than 100,000 eighth graders from public schools in 40 states and other jurisdictions. Data generated from the project are representative to the population of each participant state and comparable across regions and states. In 1992, the state level data were collected in fourth grade reading and math and in eighth grade math.

Data: NAEP assesses student performance on reading, writing, math, science, citizenship, U.S. history, geography, social studies, art, music, literature, computer skills, and career and occupational development. Periodically, NAEP also conducts special assessments in areas such as health, energy, consumer education, and youth adult literacy. Background information on students, teachers, and

school administrators are also gathered. Particularly interesting is a set of information on school climate provided by teachers.

An important, innovative effort in performance assessment is the development of a system of national proficiency levels called "scale scores." This measurement supposedly serves as a standard against which comparisons are possible across sociodemographic, geographic, and curriculum/instructional categories. With this technique, proficiency estimates are made by "draws" from a posterior distribution based on optimum weighting of both students' cognitive test results and their demographics and related educational process factors. NAEP is perhaps the most challenging and hence under-utilized data resource for rural-urban comparison of educational performance. If local school information (e.g., school closing or consolidation history) is available for merging with NAEP data--which is often possible--NAEP data could offer exciting opportunities for analyzing the impact of local school changes on student achievement.

Rural-urban definition: A seven-category variable called "size and type of community" was used in NAEP to differentiate school locations (Educational Testing Service, 1992). The categories are: extreme rural, low metro, high metro, main big city, urban fringe, medium city, and small place.

Access: NAEP data is available in public use versions for 1988 and earlier. Data after 1988 is "restricted use" only and requires a license (see Appendix C). All of the data is available on nine-track mainframe tapes and tape cartridges. Beginning with the 1990 data, NAEP data will also be available on CD-ROM.

Hardware/Software Requirements: For the mainframe, a PC with terminal emulation communications software is required for telecommunications access to the mainframe computer. The use of the CD-ROM requires a CD player and a IBM or compatible computer with a 386 or better processor.

1.2.6 National Household Education Survey (NHES)

NHES is NCES's only household survey. It gathers information on early childhood education, adult education, and other important education issues from the perspective of the household head.

Design: NHES data are collected by telephone interview of a national sample of household heads. The households were selected by random digit dialing methods, with a software called Computer Assisted Telephone Interviewing (CATI). The sample is drawn from the non-institutionalized civilian population in households that have a telephone in the 50 states and the District of Columbia. The screening involves about 60,000 to 75,000 households to identify eligible respondents for interviews on one of the topical components. For example, for the 1991 NHES on early childhood education, household heads were selected if they reported in the screening interviews that there were one or more children aged three to eight in the households; whereas for the adult education survey, household adult members were surveyed regardless of their participation in education programs. The resulting sample size on each topical component is somewhere between 12,000 and 15,000 persons.

Data: The 1991 NHES focused on the utilization and the condition of child care services and adult education participation. On the theme of early childhood education participation, information was collected on family sociodemographic background (parents' age, educational attainment, employment,

income, race, marital status, home ownership, and family size); children's characteristics (age, sex, disabilities); utilization of child care services (including center-based care such as nursery schools, day care centers, or prekindergartens, and relative and non-relative provided care); the quality of the services; and the family's resources and activities in early childhood education.

The 1991 adult education component covers issues related to adult education participation. Data include: household membership and individual characteristics; participation in adult education; type of program (full-time or part-time in a college, vocational or occupational programs, or taking continuing education in various forms, e.g., correspondence courses, employer- or community-provided educational activities either for occupation or for basic skills); motivation and difficulties for program participation.

The 1993 project looks at the issues of school readiness and school safety/discipline. The school readiness component includes data on three groups: preschoolers, kindergartners, and primary students. For all the three groups, data cover: children's background (birth date, race/ethnicity, enrollment, grade, household relationships); participation in center-based programs; home activities; health and nutrition; parent and household background. Additional information specific to each group is available, including a development profile for preschoolers and data on school experience/teacher feedback for kindergartners and primary students.

The school safety and discipline component examined school environment, school safety, school discipline policy and substance use and education. Additional information was provided on characteristics of children, parents, the household, and the community. Three subgroups of respondents were interviewed, including: parents of students in grades three through five, parents of students in grades six through 12, and youth of grades six through 12.

Caution is needed, however, to see the data as essentially reflecting parents' perception of program availability and program quality, rather than an objective description of program conditions. The NHES manual notes some of respondents' misinformation.

Rural-urban definition: Only a dichotomy of metropolitan vs. non-metropolitan areas is offered in NHES files, based on the Census information related to the zip codes reported by the interviewees.

1.3 Possible Applications to Rural Education

NCES data resources may be used for program planning, policy making, and scholarly research in rural education. Some possible applications are illustrated here.

1.3.1 Applications for Program Planning

To design a program, we need to pinpoint the local strengths and weaknesses relative to other communities. NCES's school population data serve as a framework for identifying distinctive local conditions. With data for virtually every district in the nation, the School District Data Book (SDDDB) allows comparisons between a given district to other districts in the state or in the nation in specified aspects of demography and education. It enables elaborate but easy-to-operate analysis because of the

comprehensiveness of the data (demography, administration, financing, and outcomes of the school, and socioeconomic conditions of the community) and flexibility for data manipulation (e.g., breaking down data by characteristics of children, parents, households, and school districts and producing profiles, tables, and maps). The results may help craft plans to meet the local needs and convince funding agencies and stakeholders to support the project.

A concern in regard to such local application is the currency of the decennial census data. Because the 1990 census will not be updated until 2000, the reality in areas with highly mobile demography may soon differ from that portrayed by SDDDB, especially the lack of currency in poverty rates.

The Common Core of Data (CCD) may serve some of these functions, though limited by much thinner school and community data. Annually updated, the CCD presents information that is more precise for descriptive analysis of schools. It is also an authority source for sampling at the national and local levels for marketing, polling, and survey research.

Besides population data, some survey data also can serve for local planning because many of the survey projects produce reasonably good estimates of regional or local conditions. NELS:88, SASS, NAEP, and NHES may be used for this purpose because they are conducted periodically, generating timely information for estimates of education conditions.

1.3.2 Applications for Policy-making

Policy-making requires knowledge of program effectiveness and local needs for resources, incentives, and technical assistance. A wide range of policy issues at the district, state, and national levels may be addressed with NCES data. Under the rubric of school effectiveness, for example, many questions can be considered with NCES data. In the nation or in a state, how do rural districts differ from non-rural districts in operation and performance? What are the strengths and weaknesses of rural schools compared with urban schools? Do rural schools face greater fiscal strain than schools elsewhere? What are the curriculum differences between rural and non-rural districts in course offering and taking? How do the working conditions of rural administrators and teachers differ from those of their urban colleagues? What factors are responsible for those differences? What are the consequences of these differences to student outcomes such as academic achievement, graduate rates, and post-secondary school mobility? These issues, needless to say, have implications for regulation, policy making and resource allocation in rural education.

While population data such as SBBD may shed some light on these issues, more dynamic information is available from survey projects. SASS, for example, enables comparison of rural-urban differences in school effectiveness with concepts such as school/community context, program/curriculum offering, administration and instruction styles, staff attitudes and working conditions, school revenues and expenditures, and student dropout and graduate rates. Its sampling design allows rural-urban comparisons in particular states, regions, and the nation as a whole.

Taking NLS72, HS&B, and NELS:88 together, we are able to obtain a historical picture of the rural-urban schooling. Though these projects may not have necessarily selected a nationally representative sample on the school level, school effectiveness can be examined with the data, given certain sampling adjustment (NCES, in press).

NAEP is another source for investigating the effectiveness issue in rural education. The power of this survey is its continuity and extensive coverage of performance data, which gives it great potential for trend analysis. The limitations in terms of rural education research is its relative lack of data on background and processes, which may cripple in-depth explanatory effort. The technical complexities in sampling and measurement also make NAEP data difficult to use.

Lack of coverage of rural-specific issues by NCES datasets is a difficulty facing rural policy research. School consolidation, an issue with high stakes regarding policy making and the local community life, has evoked on-going debates in many rural communities (Hobbs, 1991). NCES datasets do not contain information on the history or processes of school consolidation. A potential solution is to incorporate local or state data on school consolidation into NCES data for specific analysis.

Another uncovered rural issue is the nature of the curricula offered by local rural schools. Community-based school programs such as Foxfire are said to benefit students and the community by cultivating the meanings of rural life and strengthening community identity and attachment (Wigginton, 1985; Theabold, 1992). Increasingly, more rural schools are incorporating this approach into their programs (Hobbs, 1991; Stern, 1994). To confirm the claims, comprehensive studies of the programs' effectiveness are needed. Lacking data on such innovative curricula makes investigation of the issue impossible.

1.3.3 Applications for Scholarly Research

Scholarly research tries to understand and explain educational processes, resulting in findings that may or may not have immediate policy implications. For instance, a dilemma in rural education interesting to researchers is: While rural communities have a pressing need for the educated individual but limited resources to support schools, schools are training students with urban-oriented skills, which actually encourage students to leave the rural community for the urban labor market (DeYoung, 1991). It is unclear which educational programs, academic or occupational, are more effective for fostering community attachment among rural youth. Using HS&B data, it is possible to trace school curriculum-offering and student course-taking and to link these measures to post-high school student mobility. With hierarchical linear models, analysts may be able to disentangle the program effects and individual student effects such as course taking, significant others' influence, and socioeconomic background. HS&B provides local labor market indicators that are critical control factors for the analysis.

One of the most intriguing questions is the rural-urban difference in performance of disadvantaged children. Socioeconomically disadvantaged children seem to do better in rural schools than they do in urban schools. A hypothetical explanation links this to local cultural differences. In rural settings, relative to urban places, student-teacher interaction is hypothesized to be more personal, the parent-child relationship is closer, and the school environment is safer. Thus, socioeconomic disadvantage may be mainly a restraint of resource in rural schooling; whereas poverty in urban places is often interwoven with complicated social and family problems. To confirm such an explanation of rural cultural strength, one can use NELS:88's dense information about the community, family, and interaction between students and teachers and parents.

Section 2

Data Access Issues

This section describes the policies related to access of NCES data. It also describes sources of information on NCES databases and possible analysis help.

2.1 NCES Public Use Data

NCES provides data in "public use" format. These public data files may contain modified versions of the survey data, with the individually identifiable information statistically masked. Public use data and information are currently disseminated in the following media, depending on the survey:

CD-ROMs
9-Track Tapes
3480 Tape Cartridges
PC Diskettes
INET (Department of Education's Internet node)

NCES also provides the results of their data collection efforts for public use in the form of publications available from NCES and the ERIC On-Line Service.

Inquiries regarding access to NCES public use data should be directed to:

Education Information Branch
Program Information Division
OERI
555 New Jersey Avenue
Mail Stop 5641, Rm 300
Washington, DC 20208-5725
1-800-424-1616

2.2 NCES Restricted Use Data

NCES provides a licensing mechanism for obtaining Restricted Use datasets for research. The details involved in accessing this data are provided in Appendix C. This data is available in the same media as the NCES Public Use Data.

2.2.1 INET

The Office of Educational Research and Improvement's Institutional Communications Network (INET) is a telecommunications service designed to facilitate communication and information sharing among the major education research, development, and dissemination institutions that OERI supports, such as the National Research and Development Centers, Regional Educational Laboratories, Educational Resources Information Center (ERIC), and the National Diffusion Network. INET is the host for several local databases containing statistical information, and makes that data available to a broad Internet audience. This system is accessible through the Internet and toll-free telephone lines (800-241-

4638 with a login ID and a password) and through the Department of Education's Local Area Network. Among the major capabilities provided (but not specific to rural education issues) by INET are:

- Online, Searchable Databases
- Electronic Mail (E-mail), including a mailing list
- File Transfer and Document Exchange
- Bulletin Boards
- Electronic Teleconferencing
- Online Help Facility
- Online Questionnaires
- Gateways to other Networks/Systems

INET became the U.S. Department of Education's first Internet node in March 1993. It has provided Gopher and FTP (File Transfer Protocol) services since the Fall of 1993, and has had a World Wide Web (WWW) server since the Spring of 1994. These services give access to a broad range of databases and files containing both statistical data and research and development information aimed at improving teaching and learning. The WWW server currently contains:

- Information about the Department's mission, organization, and key staff
- A Teacher's Guide to the U.S. Department of Education*, with links to network-available resources and documents
- A Researcher's Guide to the U.S. Department of Education*
- ED press releases, with an experimental full-text search capability
- The full hypertext of ED publications, including Publications for Parents
- OERI Bulletin*
- Programs and Plans of the National Center for Education Statistics*
- Youth Indicators 1993*
- National Excellence: A Case for Developing America's Talent*
- Links to the ED/OERI Gopher server and to other ED-supported network resources.

To access the gopher server, gopher to gopher.ed.gov or select North America/U.S. Department of Education. For ftp client, ftp to ftp.ed.gov, logon anonymous. For WWW client, point to URL=http://www.ed.gov. For OERI BBS, dial 1-800-222-4922 (local 202-219-1511).

2.2.2 CD-ROM and Related Techniques

A radical improvement in accessing large datasets is made with CD-ROM technology, which stores vast information in small-sized discs. With specific computer software, CD-ROM allows easy access to and search of large datasets with complicated structures. Using CD-ROM technology, NCES staff created electronic code books which enable quick review and extraction of variables contained in different data files. With specified function keys, users can call upon screens for variables' frequency distribution and the original questionnaire items. Tedious and error-prone data entry work for extracting data is eliminated. It is a great advantage for data users to have a personal computer with a CD-ROM reader.

2.3 Data and Technical Services – the National Data Resource Center

NCES has established the National Data Resource Center (NDRC) to enable education researchers and others to obtain statistical tabulations and analyses of datasets maintained by NCES. Researchers and others may ask the NDRC to perform specific tabulations or analyses, or they may work on-site directly with confidential datasets upon signing a confidentiality pledge. The NDRC has developed strict procedures to ensure that individuals in surveys cannot be identified from NCES datasets. No data which could be used to identify an individual who supplied that data will be released.

Currently, the NDRC has files available from the Common Core of Data, the 1988 National Educational Longitudinal Study, the Schools and Staffing Survey, the Integrated Post-secondary Education Data System, the National Study of Post-secondary Student Aid Study, the National Household Education Survey, and the National Study of Post-secondary Faculty.

For further information on the NDRC contact:

Carl Schmitt
Elementary and Secondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208-5651

202-219-1642

2.4 Data Access Tips

Several suggestions may help readers access data from NCES.

1. Call the National Data Resource Center to get on its mailing list so that you get updated information about data projects published by NCES.
2. Study available publications about data products to define your data needs as precisely as possible so that you can save time.
3. If your data needs are specific and straightforward, simply call the National Data Resource Center to request the given pieces of information or data tabulations.
4. If you do need to analyze data yourself, call the specific staff members who have knowledge of the particular project and discuss your needs with them.
5. If you need to regularly use NCES data, attend a seminar sponsored by NCES.
6. Try to access data through telecommunications networks; this will become increasingly easy and efficient.

Section 3

Linking Research Issues to Data

Researchers always face the task of identifying relevant data to answer research questions formed upon theoretic or policy concerns. This requires thoughtful conceptualization to express research issues with empirical data and a time-consuming routine to scrutinize lengthy documents to identify appropriate pieces of information. For those who are not familiar with the large number of NCES projects and related publications, it is a heavy burden to link data with specific research questions.

To ease the data users' task, this section provides a listing of selected rural education research issues with possibly applicable data files and variables that are available from NCES. This issue-data listing is intended to stimulate thinking on research by applying NCES data and to supply a handy instrument for quick scanning of relevant data. The listing, however, does not necessarily exhaust the pertinent data available from NCES files in covering rural research issues. We may well have overlooked some data useful to a particular research project when reviewing the resource of NCES data. Users themselves should always check the full data documents if they are seriously interested in a possible application of NCES data to research.

3.1 Sources for the Research Issue Listing

Research issues are derived from two sources. One is a 1989 brochure issued by the Federal Interagency Committee on Education (FICE, 1989). This brochure systematically examines rural education issues and briefly summarizes the most significant areas for research and policy analysis. It also opened discussion on prioritizing the rural education research agenda.

The other source for the proposed research issues is the Appalachia Educational Laboratory's report on its study of rural education scholars' opinions on important research and policy issues (AEL, 1994). Between 1992 and 1993, AEL conducted a three-round Delphi study to examine the input on research agenda from a group of active rural education researchers. The result was a listing of prioritized research themes of current interest.

To incorporate the ideas from the two sources, we made balances and modifications using our own judgement as analysts interested in rural education. The listing, following AEL's report, presents broad research areas (e.g., effectiveness of rural schools, curriculum in rural schools) in which more specific issues (e.g., educational program delivery to disadvantaged populations, characteristics of effective rural schools, evaluation of student achievement, and others) are listed with pertinent NCES data.

While the resulting listing of research issues expresses many priorities in rural education research, we do not claim to present a comprehensive source of important research topics. The listing is meant to offer a convenient tool for researchers who start working with NCES data to address well articulated rural issues.

3.2 Procedures Used to Link Data to Issues

For each research issue, we reviewed NCES datasets and related documentation to determine the relevance of the data to the issue. The key concepts in the research issue were linked to relevant data, which are specified by variable names and variable labels used in SAS or SPSS command files.

3.2.1 Concepts and Variables

A concept is usually represented by more than one variable. Multiple variables may cover the concept's different dimensions. They also may be repeated measures of the same concepts across waves of a longitudinal survey.

Data users are able to differentiate these variables by checking the variable names and variable labels. In virtually all NCES datasets, variables are named with one or two letters followed by a set of numbers and other letters. The initial letters always indicate the project or the wave of longitudinal survey. For example, in NELS:88, BY16 means base year student file variable no. 16; whereas F1S23 means first follow-up student file variable no. 23. For variables that cover multiple dimensions of one concept in the same wave of survey, their names usually start with the same initial letters but followed by different numbers. For variables that repeatedly measure the same concept across waves of survey, the initial letters in the variables would differ. Variable labels are often the compact statements of questionnaire items. Although sometimes still not sufficiently clear due to their limited length, variable labels do offer information for grasping the meaning of a variable as they relate to research concepts.

We tried to cover only focal concepts involved in research questions. Background or controlled variables, though needed for analysis, are not covered by the data listing because the large number of these variables would make the listing too long. For example, in examining students' education expectations, the user may want to look at rural-urban differences while controlling for family socioeconomic background, school demographic characteristics, and perhaps student academic performance. We provide only data on students' education expectation and leave out other variables to avoid making the listing excessively long. For the same reason, variables which are technically needed for computing statistics (such as weighting factors) or for identifying subsamples (such as imputation flags) are not included. Readers will need to check the documentation to identify data for related concepts and for handling technical issues.

3.2.2 Multiple Datasets for One Issue

Data from multiple datasets are often applicable to address a given topic. Thus, whenever appropriate, more than one dataset is linked to each research issue. If the whole data file is relevant, we simply gave the data file name (with no listing of individual variable names) and noted that the whole data project was designed to address the given issue. If only part of a dataset is applicable to the issue, we presented only the relevant data in the dataset. In case there are no data available from NCES products for studying a topic, we had to drop this topic in spite of its significance.

3.2.3 Rural-Urban Codes

The rural-urban codes specific to each dataset were listed because of our central concern with rural-urban differentiation. Many datasets include more than one locale code. The codes differentially represent urbanicity of the school and community. Some are present in the file to indicate respondents' residential locales across waves of the survey in a longitudinal design. Readers should pay attention to these different categorizations of school or community locales. The codes either impose restrictions or offer flexibility to the analysis since they reflect different rural-urban definitions and varying extensiveness of information on locales (e.g., some codes contain only a dichotomy, others contain up to 10 categories). Readers are referred to Section 2 for a discussion of locale codes in each dataset and Appendix A for a listing of different locale schemes).

NHES (1991 Adult File)

This project was specifically designed to study adult literacy education and basic skills education. Virtually all variables are relevant to this research issue.

Rural-urban code

URBAN "URBANICITY"

Research Issue: Satisfaction of students, teachers, administrators, parents, and community leaders with curriculum, instruction and schooling in general

Research Issue: Native American communities' different learning environment and the impact on education

SASS (1987-88, Public School File)

Identification of the Native community

SSC018 DESCRIPTION OF COMMUNITY
SSC052 % OF AMERICAN INDIAN /ALASKAN STUDENTS
SSC057 % OF AMERICAN INDIAN /ALASKAN TEACHERS

School demographic characteristics

SSC011 ENROLLMENT ON OCT. 1, 1987
SSC012 ENROLLMENT ON OCT. 1, 1986
SSC013 LEVEL OF SCHOOL
SSC014 SCHOOL DESCRIPTION
SSC015 IS THIS SCHOOL COEDUCATIONAL
SSC016 PERCENTAGE OF MALE STUDENTS
SSC057 % OF AMERICAN INDIAN /ALASKAN TEACHERS
SSC058 % OF ASIAN OR PACIFIC ISLANDER TEACHERS
SSC059 % OF HISPANIC TCHRS, REGARDLESS OF RACE
SSC060 % OF BLACK (NOT HISPANIC) TEACHERS
SSC061 % OF WHITE (NOT HISPANIC) TEACHERS

School operation/programs

SSC048 # OF DAYS IN FOR HIGHEST GRADE
SSC049 LENGTH OF DAY FOR HIGHEST GRADE (HRS.)
SSC050 LENGTH OF DAY FOR HIGHEST GRADE (MIN.)
SSC142 SELF-CONTAINED CLASSES
SSC143 TEAM TEACHING
SSC144 DEPARTMENTALIZED SITUATION
SSC145 SELF-CONTAINED
SSC146 TEAM TEACHING
SSC147 DEPARTMENTALIZED SITUATION

Staffing

SSC148 ASSIGNED FULL-TIME TEACHERS
SSC149 PERSONNEL DO SOME PART-TIME TEACHING
SSC150 TOTAL TEACHERS REGULARLY EMPLOYED
SSC151 % TEACHERS WITH LESS THAN 3 YEARS EXP
SSC152 % TEACHERS WITH 3-9 YEARS EXP
SSC153 % TEACHERS WITH 10-20 YEARS EXP
SSC154 % TEACHERS WITH MORE THAN 20 YEARS EXP
SSC155 TCHRS HAVING BEYOND BACHELORS DEGREE
SSC156 TOTAL FTE PRINCIPALS/ASST. PRINCIPALS

SSC157 TOTAL FTE TEACHERS
 SSC158 TCHRS PAID BY SCHOOL/SUPPORTORS
 SSC159 TCHRS PAID BY PUBLIC AGENCIES
 SSC160 TOTAL FTE GUIDANCE COUNSELORS
 SSC161 TOTAL FTE LIBRARIANS AND OTHER
 SSC162 TOTAL FTE OTHER PROFESSIONAL STAFF
 SSC163 TOTAL FTE PAID BY PRIVATE SCHOOL
 SSC164 TOTAL FTE PAID BY PUBLIC AGENCIES
 SSC165 TOTAL FTE TEACHER AIDES
 SSC166 TOTAL FTE OTHER NONINSTRUCTIONAL STAFF
 SSC167 UNPAID VOLUNTEERS PROVIDE SERVICE
 SSC168 UNPAID VOLUNTEERS EXPECTED
 SSC173 ADDITIONS OCT 1,1986- OCT 1,1987

School performance

SSC051 PERCENTAGE OF STUDENTS NOT IN ATTENDANCE
 SSC135 % STUDENTS ENROLLED AT BEGIN/YR & END/YR
 SSC138 % 12TH GR ENROLLED ACADEMIC/COLLEGE PREP
 SSC140 12TH GRADE GRADUATES
 SSC141 % GRADUATES APPLYING TO 2,4 YR COLLEGES

SASS (1990-91, Public School, LEA, and Teacher Followup Files)

Notes

¹ NELS:88 follow-up surveys were not designed to represent the national population of schools. It is thus recommended to do certain sampling corrections when analyzing school level data. A rigorous study of school effects should use data from the NELS School Supplement Survey, which was intended to studying school effects and will be released soon.

² This file is not available from the High School and Beyond files on CD-ROM. It is on the tape and can be downloaded and merged with other HS&B files. Users should contact Aurora D'Amico of NCES (tel. 202/219-1365) for the data file and documentation.

³ CD-ROM is the most commonly used CCD product. The software presents menu-driven tabulations. While variable names can be used to extract data, they do not make sense for linking data to research questions because they are simple sequential numbers of the fields with no meaningful labels (NCES will improve this in the future). Thus, instead of variable names, data headings in the tabulations are presented here.

Appendix A

Locale Definitions

Department of Commerce Bureau of Census

Census Definition of Urban and Rural Locale

The Census Bureau defines "urban" for the 1990 census as comprising all territory, population, and housing units in urbanized areas and in places of 2,500 or more persons outside urbanized areas. More specifically, "urban" consists of territory, persons, and housing units in:

1. Places of 2,500 or more persons incorporated as cities, villages, boroughs (except in Alaska and New York), and towns (except in the six New England States, New York, and Wisconsin), but excluding the rural portions of "extended cities."
2. Census designated places of 2,500 or more persons.
3. Other territory, incorporated or unincorporated, included in urbanized areas.

Territory, population, and housing units not classified as urban constitute "rural." In the 100-percent data products, "rural" is divided into "places of less than 2,500" and "not in places." The "not in places" category comprises "rural" outside incorporated and census designated places and the rural portions of extended cities. In many data products, the term "other rural" is used; "other rural" is a residual category specific to the classification of the rural in each data product.

In the sample data products, rural population and housing units are subdivided into "rural farm" and "rural non-farm." "Rural farm" comprises all rural households and housing units on farms (places from which \$1,000 or more of agricultural products were sold in 1989); "rural non-farm" comprises the remaining rural.

The urban and rural classification cuts across the other hierarchies; for example, there is generally both urban and rural territory within both metropolitan and non-metropolitan areas.

In censuses prior to 1950, "urban" comprised all territory, persons, and housing units in incorporated places of 2,500 or more persons, and in areas (usually minor civil divisions) classified as urban under special rules relating to population size and density. The definition of urban that restricted itself to incorporated places having 2,500 or more persons excluded many large, densely settled areas merely because they were not incorporated. Prior to the 1950 census, the Census Bureau attempted to avoid some of the more obvious omissions by classifying selected areas as "urban under special rules." Even with these rules, however, many large, closely built-up areas were excluded from the urban category. To improve its measure of urban territory, population, and housing units, the Census Bureau adopted the concept of the urbanized area and delineated boundaries for unincorporated places (now, census designated places) for the 1950 census. Urban was defined as territory, persons, and housing units in urbanized areas and, outside urbanized areas, in all places, incorporated or unincorporated, that had

2,500 or more persons. With the following three exceptions, the 1950 census definition of urban has continued substantially unchanged. First, in the 1960 census (but not in the 1970, 1980, or 1990 censuses), certain towns in the New England states, townships in New Jersey and Pennsylvania, and Arlington County, Virginia, were designated as urban. However, most of these "special rule" areas would have been classified as urban anyway because they were included in an urbanized area or in an unincorporated place of 2,500 or more persons. Second, "extended cities" were identified for the 1970, 1980, and 1990 censuses. Extended cities primarily affect the figures for urban and rural territory (area), but have very little effect on the urban and rural population and housing units at the national and State levels--although for some individual counties and urbanized areas, the effects have been more evident. Third, changes since the 1970 census in the criteria for defining urbanized areas have permitted these areas to be defined around smaller centers.

Documentation of the urbanized area and extended city criteria is available from the Chief, Geography Division, U.S. Bureau of the Census, Washington, DC 20233.

Extended City

Since the 1960 census, there has been a trend in some States toward the extension of city boundaries to include territory that is essentially rural in character. The classification of all the population and living quarters of such places as urban would include in the urban designation territory, persons, and housing units whose environment is primarily rural. For the 1970, 1980, and 1990 censuses, the Census Bureau identified as rural such territory and its population and housing units for each extended city whose closely settled area was located in an urbanized area. For the 1990 census, this classification also has been applied to certain places outside urbanized areas.

In summary presentations by size of place, the urban portion of an extended city is classified by the population of the entire place; the rural portion is included in "other rural."

File 1 Technical Documentation. 1991 Washington, DC: U.S. Bureau of Census

NCES Definition of Locale

The community type is based upon the Census definition of community size and its relation to urbanized or rural places. It is determined by ZIP Code, and matched to the Census community size for that ZIP Code. This seven-value schema is defined as:

1. Large city - central city of a standardized metropolitan area having a population greater than or equal to 400,000 or a population density greater than or equal to 6,000 people per square mile.
2. Mid-size city - central city of a standardized metropolitan area having a population less than 400,000 and a population density less than 6,000 people per square mile.
3. Urban fringe of large city - place within a metropolitan area of a large city and defined as urban by Census (i.e., within same county).
4. Urban fringe of mid-size city - place within a metropolitan area of a mid-size city and defined as urban.
5. Large town - a town not inside a metropolitan area, with a population greater than or equal to 25,000.
6. Small town - a town not within a metropolitan area and with a population less than 25,000 but greater than 2,500.
7. Rural - a place with fewer than 2,500 people or a place designated as rural by Census.

Source: Johnson, F. (1989), Assigning Type of Locale Codes to the 1987-88 CCD Public School Universe, National Center for Education Statistics Technical report, Data Series: SP-CCD-87188-7.4, CS 89-194

Office of Management and Budget Definition of Locale

Metropolitan Areas

The term Metropolitan Area (MA) refers collectively to Metropolitan Statistical Areas, Consolidated Metropolitan Statistical Areas, Primary Metropolitan Statistical Areas, and New England County Metropolitan Areas. The Office of Management and Budget (OMB) defines new MAs and revises definitions of existing MAs by applying published standards to decennial census data.

Metropolitan Statistical Area (MSA)

An area consisting of one or more contiguous counties (cities and towns in New England) that contain a core area with a large population nucleus, as well as adjacent communities having a high degree of economic and social integration with that core. The core area must include a city with a population of 50,000 or more, or an urbanized area (UA). If a MSA qualifies on the basis of a UA (and no city of 50,000), the total MSA population must be at least 100,000 (75,000 in New England). Counties with substantial proportions of their population in the UA(s) are the central counties of the MSA; contiguous counties are added on the basis of a combination of commuting rates into the central counties and measures of metropolitan character such as population density and percentage of population that is urban. New MSAs can be defined during the intercensal period based on population estimates or special censuses; these must, however, be confirmed with data from the next decennial census.

Consolidated Metropolitan Statistical Area (CMSA)

An area that meets the requirements to qualify as a MSA and has a population of one million or more becomes a CMSA if component parts are recognized as Primary Metropolitan Statistical Areas (PMSAs).

Primary Metropolitan Statistical Area (PMSA)

If an area meets the requirements to qualify as a MSA and has a population of one million or more, one or more PMSAs may be defined within it if statistical criteria are met and local opinion also is in favor. A PMSA consists of a large urbanized county, or a cluster of such counties (cities and towns in New England) that have substantial commuting interchange. When one or more PMSAs have been recognized, the balance of the original, larger area becomes an additional PMSA; the larger area of which they are component parts then is designated a CMSA.

The New England County Metropolitan Area (NECMA)

The NECMA provides an alternative to the city- and town-based metropolitan areas in New England for data users who desire a county-defined set of metropolitan areas. The NECMA for a MSA or CMSA includes: (1) the county containing the first named city in the metropolitan area title (this county may include the first-named cities of other MSAs or CMSAs); and (2) each additional county having at least half of its population in the MSA/CMSA whose first-named cities are in the county identified in step 1. NECMAs are not defined for PMSAs.

**United States Department of Agriculture
Economic Research Service**

Definitions for the Updated County Types

Farming-dependent counties--Farming contributed a weighted annual average of 20 percent or more of total labor and proprietor income in 1981, 1982, 1984, and 1986. (The year 1983, an extremely aberrant year for farm income, was dropped).

Manufacturing-dependent counties--Manufacturing contributed 30 percent or more of total labor and proprietor income in 1986.

Mining-dependent counties--Mining contributed 20 percent or more of total labor and proprietor income in 1986.

Specialized government counties--Government activities contributed 25 percent or more of total labor and proprietor income in 1986.

Persistent-poverty counties (definition not updated)--Per capita personal income in the county was in the lowest quintile in each of the years 1950, 1959, 1969, and 1979.

Federal lands counties(definition not updated)--Federal land made up 33 percent or more of the land area in a county in 1977.

Retirement-destination counties (definition not updated)--For the 1970-80 period, net immigration rates of people aged 60 and over were 15 percent or more of the expected 1980 population aged 60 and over.

Unclassified counties

Appendix B

Recent Census Data Applicable to Rural Education Research

Excerpts of the publications by the Bureau of the Census

Three major projects of the U.S. Bureau of the Census generate data that can be used for research on issues related to education, children, and families in rural America. They are: the Current Population Survey (CPS), Survey of Income and Program Participation (SIPP), and the Decennial Census. All the three data projects provide measures of household residential locale, either with metropolitan/non-metropolitan or urban/rural categorizations or both. Since a large bulk of the Decennial Census data was incorporated into the School District Data Book (see Section I), this appendix does not provide information about the Decennial Census. Excerpts from current documents for CPS and SIPP are cited here.

Current Population Survey, March 1988-1991 on CD-ROM (*machine-readable data file*) conducted by the Bureau of the Census for the Bureau of Labor Statistics. -Washington: Bureau of the Census (producer and distributor), 1991.

Type of file:

Microdata; unit of observation individuals, families and households.

Universe Description:

The universe is the civilian noninstitutional population of the United States living in housing units and members of the Armed Forces living in civilian housing units on a military base or in a household not on a military base. A probability sample is used in selecting housing units.

Subject-Matter Description:

This file, also known as the Annual Demographic File provides the usual monthly labor force data, but in addition, provides supplemental data on work experience, income, noncash benefits, and migration. Comprehensive information is given on the employment status, occupation, and industry of persons 15 years old and over. Additional data for persons 15 years old and older are available concerning weeks worked and hours per week worked, reason not working full time, total income and income components, and residence on March 1 in year of survey. Data on employment and income refer to the preceding year, although demographic data refer to the time of the survey.

This file also contains data covering nine noncash income sources: food stamps, school lunch program, employer-provided group health insurance plan, employer-provided pension plan, personal health insurance, Medicaid, Medicare, CHAMPUS or military health care, and energy assistance.

Characteristics such as age, sex, race, household relationship, and Hispanic origin are shown for each person in the household enumerated.

Geographic Coverage:

State of residence is uniquely identified as well as census geographic division and region. The 113 largest metropolitan statistical areas (CMSAs or MSAs), an additional 89 selected MSAs, 66 selected PMSAs, and 30 central cities in multi-central city MSAs or PMSAs are also uniquely identified. Within confidentiality restrictions, indicators are provided for MSA-PMSA/non-MSA-PMSA, central city/noncentral city, farm/non-farm, and MSA/CMSA size.

Technical Description:

File Structure: Hierarchical.

File Size:

1988: 295,459 logical records; record size is 656 characters.

1989: 275,770 logical records; record size is 656 characters.

1990: 299,576 logical records; record size is 656 characters.

1991: 300,012 logical records; record size is 656 characters.

File Sort Sequence: Census state code (MSTATE), then MSA/PMSA rank code

Reference Materials:

Current Population Survey, March 1988-1991 on CD-ROM Technical Documentation. The documentation includes this abstract, pertinent information about the file, a glossary, code lists, and data dictionaries. One copy accompanies each file order and is also available on the CD-ROM. When ordered separately, it is available for \$10 from Data User Services Division, Customer Services, Bureau of the Census, Washington, DC 20233.

Related Printed Reports:

Data from the March Current Population Survey are published most frequently in the Current Population Reports P-20 and P-60 series. These reports are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Forthcoming reports will be cited in *Census and You*, CENDATA, the *Monthly Product Announcement* (MPA), and the Bureau of the Census Catalog and Guide.

Related Machine-Readable Data Files:

A public use education of the Current Population Survey, March file is available for each year since 1968. For 1980, 1984 and 1988 two March files are available for each year. The first March 1980 file contains estimates based on 1970 population counts and should be used for historical comparison ending in 1980. The re-weighted March 1980 file contains estimates based on results of the 1980 census and should be used for comparisons between 1981 and 1984.

In 1984, the Bureau of the Census introduced a step into the March second stage weighting procedure to control individual weights to independent estimates of the Hispanic population. Since this introduction caused a major disruption in the Hispanic estimates from March two data files were created. The first file, without the Hispanic controls should be used for comparing estimates for year prior to 1984 and the second file should be used for comparison with 1985 and forward files.

From March 1989 forward, data on the Annual Demographic File are processed using the rewrite system. The rewrite system includes revised procedures to match supplement records to basis CPS records; revised weighting procedures; revised demographic and family edits; revised imputation procedures; and more income detail on the file.

For March 1988 there are two files, the regular Annual Demographic File and the Annual Demographic Rewrite File. The rewrite file has been prepared to allow historical comparison of data from the rewrite processing system implemented between 1988 and 1989. It is recommended that the rewrite file be used when comparing data collected from the March Annual Demographic Supplement from 1988 forward. Use the regular file, released in 1988, when comparing data from 1988 and prior years.

This is not to say, however, that comparisons cannot be made between years before and after 1988. When such analyses are done, for example between 1986 through 1989, data users must consider that similarities or differences between the data may be caused or effected by the rewritten system. Thus, comparing estimates from the 1988 rewrite files and the 1988 regular file will reveal the extent of any differences caused by the processing system changes though not the specific change. The magnitude of the difference can then be applied to the estimates from 1986 - 1987 to reveal whether any real differences exist. There were several revisions made to the processing programs; therefore, it is difficult to determine which specific revision effect the differences or similarities in the data.

Some non-March data also are available from 1968 to present. For more information, request the *Data Developments* on the Current Population Survey from Data User Service Division, Customer Services, Bureau of the Census, Washington, DC 20233.

Related Public Domain Software:

The Census Bureau has placed various software that can be used with CD-ROMs in the public domain. This software is available to users from the following two sources:

- The Census Bureau's electronic bulletin board. You may access the bulletin board using a modem on (301) 763-7554. For information, the voice grade telephone number is (303) 763-1580.

File Availability:

The CD-ROM may be ordered from Data User Services Division using the Customer Services order form on the following page. The cost of the CD-ROM is \$150.

Survey of Income and Program Participation (SIPP) 1993

Panel Wave 1 Core Microdata File *[machine-readable data file]* / conducted by the U.S. Bureau of the Census. -Washington: The Bureau [producer and distributor], 1994.

Type of File

Microdata; unit of observations an individual.

Universe Description

The universe is the resident population of the United States, excluding persons living in institutions and military barracks.

Subject-Matter Description

The file contains basic demographic and social characteristics data for each member of the household. These include age, sex, race (White; Black; American Indian, Eskimo, ad Aleut;Asian or Pacific Islander; and Other), ethnic origin (23 categories including 7 Spanish origin categories), marital status, household relationship, education, and veteran status. Limited data are provided on housing unit characteristics such as units in structure, tenure, access, and complete kitchen facilities. Core data also cover post secondary school attendance, public or subsidized rental housing, low-income energy assistance, and school breakfast and lunch participation.

The sample in each wave consists of 4 rotation groups, each interviewed in a different month. For Wave 1 the interview months are from February to May 1993. For each group the reference period for reporting labor force activity and income is the four calendar months preceding the interview month.

SIPP is a longitudinal survey where each sampled household and each descendent household is re-interviewed at 4-month intervals for 9 interviews or "waves." These files contain the results of the first interviews. Unique codes are included on each record to allow linking together the same persons from the preceding and subsequent waves.

Geographic Coverage

United States. Codes are included for 41 individual States and the District of Columbia, **although the sample was not designed to produce State estimates.** Areas in the SIPP sample in nine other Stats are identified in groups for confidentiality reasons. The file identifies a subsample of metropolitan residents, along with codes for selected metropolitan statistical areas (MSAs) and consolidated metropolitan statistical areas (CMSAs).

Technical Description

File Structure: Rectangular. Each logical record for a sampled person includes information on the household and family of which the person was a part during each month of the reference period, as well as characteristics of the person and each source of income received during the period. Beginning in 1990 the unit observation changed from one record for each person to one record for each person for each month.

File Size: 207,980 logical records; 1,460 character logical record length.

File Sort Sequence of Sample Units: Sampling unit sequence number by entry address ID by person number within sampling unit and reference month.

Reference Materials

Reference materials listed below may be ordered from Data User Services Division, Customer Services, Bureau of the Census, Washington, DC 20233. One copy of the technical documentation and the user's guide accompany each file order. Costs of additional copies of these materials and of the interviewers' manual may be obtained by calling Customer Services on 301-763-4100.

Interviewer's Manual (1985). Survey of Income and Program Participation. U.S. Department of Commerce, Bureau of the Census.

Survey of Income and Program Participation (SIPP) 1993 Panel, Wave 1 Core Microdata File Technical Documentation. The documentation includes this abstract, the data dictionary, an index to the data dictionary, relevant codes lists, questionnaire facsimiles, and general information on SIPP.

Survey of Income and Program Participation Users' Guide. The *Users' Guide* contains a general overview of the file as well as chapters on survey design and content, structure and use of cross-sectional files, linking waves and reliability of the data.

Related Printed Reports

Related printed reports include working papers, compilations of papers presented at annual meetings of the American Statistical Association, articles appearing in the *Journal of Economic and Social Measurement*, and reports in the P-70 series of the *Current Population Reports*. See the *Users' Guide* that accompanies the documentation for ordering information.

Related Machine-Readable Data Files

SIPP files from all Waves of the 1984 through 1991 Panels as well as Waves 1 through 5 of the 1992 Panel are available from Customer Services, Data User Services Division, Bureau of the Census, Washington, DC 20233. An order form is on the following page for your convenience.

File Availability

Survey of Income and Program Participation (SIPP) 1993 Panel, Wave 1 Core File is available on computer tape at 6250 bpi; ASCII or EBCDIC, and standard ANSI labeling. The file can also be made available on IBM 3480 compatible tape cartridge and CD-R(compact disc-recordable) in ASCII for the same price as the file on tape. A machine-readable dictionary is contained at the end of each file. This dictionary is also available separately on one tape reel or cartridge or CD-R.

Appendix C

Procedures for Requesting and Acquiring Access to Restricted Use Data

Education scholars, researchers, and others may need at some time to have access to data that can make the identification of institutions and individuals possible. The policy of NCES, with respect to its mission, is to meet the objective to "acquire and diffuse among the people of the United States useful statistical information on subjects connected to education," while at the same time protecting the confidentiality of institutionally and individually identifiable information. This type of data has been given the descriptor "restricted use" data, and applies to any dataset that contains individually identifiable information. Special procedures are taken to protect this information, and it can be issued only to licensees on loan.

The procedure for requesting and acquiring access to NCES restricted use data is illustrated in the following steps:

Step 1: The Request

Restricted use data are made available only to organizations. An initial data request by an applicant organization for a NCES restricted use dataset can be made by telephone, written request, or in person. After the initial request, the applicant must submit to NCES a formal, written request on organization letterhead. The required information consists of (1) the title of the survey(s), (2) a description of the statistical research project necessitating access to the restricted use dataset, (3) the name and title of the organization's Senior Official, (4) the name and title of the Principal Project Officer, (5) the names and titles of the Professional/Technical staff, (6) the estimated duration of the loan period, and (7) the desired computer media format and conversion code.

Step 2: Application Package

Upon NCES receipt of the formal written request, it is reviewed. If all of the requirements have been met, a formal licensing application package is mailed to the applicant. This package contains (1) the appropriate licensing application, (2) a copy of an *Affidavit of Non-Disclosure* form, (3) a request for a *Security Plan* on data access, handling and storage, (4) a copy of the Department of Education *General Education Provisions Act (GEPA), Section 406*, (5) a copy of the *Privacy Act of 1974, Section 552a*, and a current copy of the *NCES Security Procedures*. Upon NCES receipt of the completed application, the information is reviewed by the Data Security Officer for content and completeness. The information is evaluated and any necessary additional information is requested from the potential licensee by the NCES Data Security Officer.

Step 3: Reviewing Security Procedures

As part of the application process, the applicant must submit a written computer access, handling and storage plan for restricted use data. This security plan must be in compliance with the *NCES Security Procedures* provided in the licensing application package. The NCES Data Security Officer will review these proposed security procedures for adequacy. All questions must be resolved in writing prior to the formal granting of a license.

Step 4: Final Clearance

When all required information has been received by NCES, and the license application is found to be complete, the original license document is submitted to the Commissioner of NCES for his/her signature. At this stage of the application process, the Data Security Officer transmits a copy of the original license to the new 'licensee'. Data base media materials and all instructional materials area also sent. The data are sent in the requested computer media format and program conversion code. The final package contains (1) the subject data, (2) downloading instructions (when necessary), (3) Warning/Restriction Labels, (4) Loan Expiration Date, and (5) Survey Data Base User's Manual.

Step 5: Monitoring of License Throughout the Loan Period

The licensee is required to submit a copy of their final publication, whether it be before or after the final research is released to the public. However, if there is some question as to the possibility of disclosure of NCES individually identifiable information, in accordance with the terms of the license, the licensee must provide NCES a copy of the proposed publication for review and authorization to publish. Upon expiration of the loan period, NCES will notify the licensee, in writing, that the return of the data to NCES is required. This notification will be sent to the licensee two months prior to the actual loan termination date.

Step 6: Conclusion of License Period

Upon the expiration of the licensee's data loan period, the licensee must return to NCES all of the items made available to the organization, including (1) the data product which contains the original subject data, and (2) any additional materials and documentation. The licensee must also purge all copies of the data from any computer system used in analysis.

Appendix D

Analysis Procedures

NCES surveys involve complicated sampling processes that deviate from simple random sampling assumptions. Additionally, these surveys often oversample certain groups (e.g., minority students) to allow for analysis based on sub-samples. In order to infer estimates from sample to population, analysis of NCES survey data must consider (1) using appropriate sample weights to correct sampling errors generated by such designs and (2) using programs specifically designed for analyzing data from complex surveys. This appendix provides excerpts from an NCES publication "A Guide to Using NELS:88 Data." Although illustrated only in relation to NELS:88 data, the discussions on the general concepts of sample weights and special analytic procedures are instructive for using other NCES survey data. It is always necessary, of course, for users to consult technical documents specific to data sets. Only with an understanding of survey design and data structure is it possible to conduct meaningful and valid analysis. A more extensive introduction of analysis of complex survey data is available from: Lee, E.S., Forthofer, R.N., & Lorimer, R.J. (1989). Analyzing Complex Survey Data. Newbury, CA: Sage Publications.

Use of Design Weights in Analyzing NELS:88 Data Understanding the Sample Design and Weights

Sample Design. The NELS:88 survey used a two-stage stratified, clustered sample design. NELS:88 students were selected in the base year using a two-stage probability sample with schools as the first-stage units and students within schools as the second stage units. Certain groups (for example, Asian and Hispanic students; private school students) were disproportionately selected, to ensure a large enough analysis sample for these subgroups. A subsample¹ of base year (1988) eighth graders was resurveyed in 1990 and 1992. The sample was "freshened" at both of these time points. That is, some individuals were added to the sample who were 1990 sophomores or 1992 seniors but who were not eighth graders in the spring term of 1988 and thus had no chance of selection into the base year. Because of sample freshening, NELS:88 constitutes a nationally representative sample of spring term 1990 *sophomores* and spring term 1992 *seniors*, as well as 1988 eighth graders.

Weighting. Weighting is used in sample surveys to accomplish a number of objectives:

- to expand counts from sample data to full population levels;
- to adjust for differential selection probabilities;
- to adjust for differential response rates; and
- to improve representativeness by using auxiliary information.

¹In the subsampling process, dropouts were retained with certainty, while Hispanics, Asians, and American Indians were disproportionately retained.

Because there are many populations of interest that can be analyzed with NELS:88 data (base year schools, 1988 eighth graders - two and four years later, 1990 sophomores, 1992 seniors, parents of students and dropouts in 1992, and so on), 12 separate "final" (or nonresponse-adjusted) weights have been produced. These weights appear on the dataset--two for the base year, four for the first follow-up, and six for the second follow-up. Guidance on using the weights is provided below.

Weights and Standard Errors

Comparing Weighted and Unweighted Frequencies

Unweighted frequencies (and percents) reflect the NELS:88 sample; weighted frequencies (and percents) reflect the national or regional population estimate that is derived from the sample. For example, there are 1,032 schools represented in NELS:88 base year school. This sample of schools represents 38,774 schools with eighth grades in the 1987-88 school year. The number of schools in the population that are represented by a given NELS:88 participating sample school is variable -- specifically, it varies from a minimum of 1.5 schools to a maximum of 387.3, with a mean of 37.5. Because of this variability in the weights, weighted and unweighted percentages will differ; true population estimates can only be produced through use of the appropriate weights. For example, if you want to examine the proportion of American schools with eighth grades in 1988 that offered an academic honor society available to eighth graders, you will find that unweighted and weighted proportions would differ in the following way:

BYSC46A ACADEMIC HONOR SOCIETY AVAILABLE TO 8TH GRADER

	UNWEIGHTED	UNWTED	WTED
	FREQUENCY	%	
Yes	579	55.9%	43.0%
No	456	44.1%	57.0%

In other words, 56 percent of the NELS:88 school sample, but 43 percent of the population of 38,774 schools with eighth grades, have academic honor societies available to eighth graders.

Comparisons to Known Population Totals

Weighted estimates from NELS:88 should approximate estimates from other national sources, within the combined sampling error of the two sources. (We say "approximate" because sampling variance is not the only possible source of measurement error; estimates can be biased by nonresponse, or by errors in reporting, data collection or data processing). Use of external sources (and the NELS:88 codebook as well) as a benchmark may thus provide a check on whether the analyst is using data correctly.

For several reasons, weighted estimates for rare populations, however, may lack precision. For example, NELS:88 data permits the analyst to examine the educational situation of Japanese--Americans attending suburban schools in the southern region.

Because of small sample sizes, sampling error will be comparatively large. Moreover, while nonresponse adjustments in the weights compensate for broad categories of nonrespondents, including nonresponding Asians, it is not possible to adjust the weights for all factors that may be associated with nonresponse. Differential response between Asian subgroups, between urban and suburban Asians, or between Asians in different regions, is not taken into account in the generation of final weights, and may bias estimates for certain subgroups. **Hence, rare populations in NELS:88 are not guaranteed to produce precise population estimates.**

Use of Standard Errors

In this section we discuss the use of standard errors, a measure of sampling variability in survey results; the standard error is an estimate of the expected difference between a statistic from a particular sample and the corresponding population value. The standard error of measurement is critical to determining the statistical significance of statistical inferences and interpretations. Because the NELS:88 sample design involved stratification, disproportionate sampling of certain strata, and clustered (i.e., multi-stage) probability sampling, the resulting statistics are more variable than they would have been had they been based on data from a simple random sample of the same size.

Popular statistical analysis packages such as SPSS or SAS do not calculate standard errors that take into account complex sample designs. Standard errors that do take into account a complex design such as that of NELS:88 will generally be higher than standard errors calculated under the assumptions of simple random sampling. Several procedures are available for estimating the variance or sampling errors for complex samples. Procedures such as Taylor Series approximations, Balanced Repeated Replication (BRR), and Jackknife Replication (JKn) produce similar results. Given the structure of the NELS:88 database users are likely to find the Taylor Series procedure the most convenient means to calculate standard errors. Software available for producing Taylor Series standard errors include C-Tab (available from NCES), SUDAAN, and SUPER CARP, among other variance estimation programs.

Alternatively, the design effect can be used to quantify the impact of departures from simple random sampling on the precision of sample estimates, and can serve as an adjustment factor for variances or standard errors calculated in accordance with the assumption of a simple random sample. For any statistical estimator (for example, a mean or a proportion), the design effect (DEFF) is the ratio of the estimate of the variance of a statistic derived from consideration of the sample design to that obtained from the formula for simple random samples. Because in many cases it is more useful to work with standard errors than with variances, the square root of the design effect (also called the root design effect, and designated as DEFT) is also useful. The root design effect expresses the relation between the actual standard error of an estimate and the standard error of the corresponding estimate from a simple random sample. A detailed account of design effects is provided in the NELS:88 user manuals and the sample design and final technical reports.

Selecting the Correct Weight

Owing to the complexity of the NELS:88 sample design, weighted data must be used to ensure accurate estimation and inference. In many cases, weights must be used with a particular flag (together with weight) in order to analyze the sample for a particular target population. The following nonresponse-adjusted weights appear on the data files:

Base Year

BYQWT. Use this weight for cross-sectional analysis of 1988 eighth graders when student is unit of analysis.

BYADMWT. Use this weight for cross-sectional analysis of 1988 schools attended by eighth graders when school is unit of analysis.

First Follow-Up

F1QWT. Use this weight for cross-sectional analysis of NELS:88 sample members in 1990 when interested in making inferences to population of 10th graders.

F1PNLWT. Use this weight to analyze 1988 and 1990 data in the examination of 1988 eighth graders two years later.

F1DQAJWT. Use this weight when analyzing dropout questionnaire items that were not included in the abbreviated version of the dropout questionnaire. (See the 1990 dropout user manual for details on use of F1DQAJWT and F1DPAJWT).

F1DPAJWT. This is the 1988-90 panel version of F1DQAJWT, suitable for use when both base year and first follow-up data will be used in analysis.

Second Follow-Up.

F2QWT. Use this weight for cross-sectional analysis of NELS:88 sample members in 1992 when interested in making inferences to the population of 12th graders.

F2F1PNWT. Use this weight for producing weighted student panel statistics when both first follow-up and second follow-up data are employed in analysis (for example, to measure changes in the 1990 sophomore cohort two years later.)

F2PNLWT. Use for producing weighted student panel statistics when all three survey waves (base year through second follow-up) are included in the analysis.

F2CXTWT. Use this weight for analyzing 1992 teacher and school administrator data. This cross-sectional weight applies to students who attended the schools selected for inclusion in the teacher and school administrator components and who completed a second follow-up questionnaire. The population was restricted to early graduates and students who were in the schools during spring data

collection. This weight allows analysts to generate national statistics at student level using the teacher and school administrator data despite the bias against small cluster sizes in sample selection.

F2TRSCWT. Use this weight for analysis involving high school transcript data. This cross-sectional weight applies to all early graduates, dropouts, students in sampled schools during spring data collection, and all sample members who were both ineligible for all three rounds of NELS:88 and were in the twelfth grade during the 1991-92 school year for whom a high school transcript was received.

F2PAQWT. Use this weight when analyzing 1992 parent data. This cross-sectional weight applies to all students (student level weight) for whom a parent questionnaire was collected during the second follow-up.

Using Weights

Table 7.1.1-1 of the first follow-up and second follow-up user's manual codebooks defines analysis samples and populations, with appropriate weights and flags (this table is also reproduced in section 8.2 of this document). For example, for the first follow-up student data, four populations of interest are identified, the number of sample members for each is specified, and weights and flags indicated, the first of which is the 1988 1990 panel--1988 eighth graders two years later. To analyze this population, the table indicates that the flag F1PANFLG should be selected, and the weight F1PNLWT employed.

Weights have *not been constructed for all possible analytic purposes*. In instances where there is a population of interest for which no specific weight has been produced, some existing weights may provide reasonable approximations. It was for this reason that no separate parent weight was produced in the NELS:88 base year, and that student weights adjusted for cognitive test nonresponse have not been generated. Base year parent--and test completion--response rates were so high relative to student questionnaire completion, that the student weight can be used for these cases with only minimal bias.

The second follow-up contextual (school), transcripts, and parent weights exist only in a cross-sectional version. This poses a difficulty (in selecting a weight) if in longitudinal analyses of, for example, the high school mathematics course histories of eighth graders who took algebra versus those who did not, you also wanted to look at the cross-wave comparison of teacher influences, or parent-reported changes in the home education support system between 1988 and 1992. One might employ the 1992 cross-sectional contextual, transcripts, or parent weights in conjunction with prior round data. However, since these weights were not produced for this purpose, population estimates produced from them would contain biases.

Extreme caution must be exercised when a researcher wishes to conduct a weighted analysis for which a specific weight has not been provided. In particular, the analyst must weigh how much bias will be introduced by substitution of another weight. Two checks that should be made are (1) examination of the sum of the weights to compare that sum to true population totals; (2) analysis of nonresponse bias, that is of what groups are disproportionately excluded by the weighting strategy. *The specific purpose and required degree of precision of the analysis must be taken into account.* If subgroup estimates are central to the analytic plan, it is necessary to take into account the subgroup level. In instances where more than one possible weight is available, the decision as to which is best should be guided by a comparison of the bias inherent in each alternative. Whatever weighting strategy is used, if the

amount of bias is non-trivial, adjustments may be incorporated in models that accommodate measurement error, and potential biases reported with the results.

Technical Approaches to Performing Regression and Other Multivariable Techniques

Need for Special Procedures

NCES longitudinal surveys are based on complex samples that use stratified cluster designs. This has an impact on the estimates of variances (i.e., standard errors) for the statistical analyses carried out on surveys such as NELS:88. Standard statistical packages such as SAS and SPSS treat data as if they were collected under a simple random sample design. There are two important aspects of the NELS:88 survey which make it different from a simple random sample design: (1) the unequal probabilities of selection, e.g., we oversample minorities, giving minorities a higher probability of selection than non-minorities; (2) the clustered nature of our designs, e.g., we sample schools (clusters) and then students rather than simply taking a sample of students directly. The impact of not having a simple random sample is that the observations are not independent and the variance of an estimate is not calculated using the standard textbook formula for s^2 . A sound approach to the analysis will account for these two characteristics of the NELS:88 sample.

Recommended Statistical Procedures

The following are recommended procedures for carrying out regression and other multivariable techniques on data from complex sample surveys such as NELS:88.

1. **Preferred Procedure: Use a program designed specifically for analyzing data from complex surveys.**

SUDAAN (Ref 1), a program which uses a Taylor series approach and is available for the mainframe or the PC is the most widely used. Others to be considered are PC CARP (Ref 2) (Taylor series approach PC), and CPLX (Bob Faye's (Census Bureau) program for contingency table analysis) or VPLX (currently able to compute variances for means and proportions and being expanded by Faye to do regression and other analyses). An NCES contractor has successfully used PC CARP and SUDAAN in recent NCES reports for regression and logistic regression analysis (Refs 3, 4, & 5).

2. **Alternative for Ease of implementation: Use SAS or SPSS or other statistical package using relative weights as described in 3 below, with or without design effect adjustment described in 3 below) for exploratory work. When you are down to a few plausible models, run SUDAAN or other package designed for survey data (as in 1 above).**

This approach saves time by doing preliminary runs with a faster, easier to use package, but checks out final results building in the survey design.

3. **Third in Preference but Acceptable Procedure: Use SAS or SPSS or other statistical package with relative weights and a design effect correction to the standard error.**

This approach gives an approximate and probably conservative adjustment, i.e., there may be real differences which we do not pick up. It is implemented as follows:

(a) Run the analysis using a standard statistical package which allows the use of weights. The weight to be used in the analysis is the relative weight: the final survey weight divided by the average weight for the group being analyzed:

$$\text{relwtj} = \text{wtj}/\text{avg wt.}$$

Using the survey weight in the analysis accounts for the oversampling of certain populations and redistributes the observations to represent the distribution in the population. Dividing by the average weight keeps the correct distribution but makes the weights add to n , the sample size for your analysis. Failure to do this would lead the analysis to believe that it has huge numbers of observations, would inflate the degrees of freedom and would inflate the value of the test statistic.

(b) Adjust the standard error to account for the complex nature of the design. To do this, multiply the standard error by the square root of the design effect for the dependent variable for the total group being analyzed. For example, if we are regressing test score on race ethnicity represented by four dummy variables, this procedure would multiply the simple random sample standard error by the square root of the design effect for test score calculated for the total group being analyzed. Such design effects are usually found in the datafile users manual. If the design effect for your dependent variable is not available, you might use the DEFT for a similar variable or the average design effect averaged over a set of variables if that is all that is available.

Better yet, but probably not readily available, is to use the average design effect of the dependent variable, averaged over subgroups represented by the independent variables in the model. In the above example, four design effects would be calculated: the design effect of the mean test score, calculated for each of the four race/ethnicity subgroups. The square root of the average of these four design effects would be used to adjust the standard error. Equivalently, rather than multiplying the standard error by the square root of the design effect, one could divide the t statistic by the square root of the design effect or divide the F statistic by the design effect.

(c) The correct degrees of freedom for the error term in these analyses is the same as that given by SAS, i.e., the simple random sample degrees of freedom: (sample size - number of terms in model).

Comparison Among Three Procedures

A regression analysis was run on the NELS:88 base year data. The relationship between the math test score (BYTXMFS) and socioeconomic status (BYSES) was examined. The analysis was run using SAS with relative weights and with SUDAAN.

The following is the SAS program used to run a weighted regression. The dataset nels.tst is a SAS dataset containing NELS variables; byqwt is the base year student weight; the average baseyear weight for the subset of students used here is 122.52.

```
data test; set nels.tst; if byqwt=OOOO.OOO then byqwt=.; if byses ge 99 then byses=.; if bytxmfs ge 999 then bytxmfs=.; byqwtrl=byqwt/122.52;
```

```
proc glm; model bytxmfs=byses; weight byqwtrl; run;
```

The same analysis was run using SUDAAN. The program statements used were as follows:

```
proc regress data="c:\sudaan61\tst" filetype=sas design=wr; nest sstratid sch id/missunit; weight byqwt; model bytxmfs=byses; test satadjf wald; setenv labwidth=16 maxind=4; title "\nex 1: multiple linear regression";
```

The results of four approaches are shown in the attached table: SUDAAN; SAS using weights with no adjustment to the variance; SAS using weights and adjusting the variance by dividing by the design effect of the dependent variable; and SAS using weights and dividing by the average design effect of the dependent variable averaged over subgroups representing the independent variable (in this example, the average design effect of the mean achievement score, averaged over the four SES quartiles). The table shows the estimates, the standard errors and the statistics.

Comparison of Various Procedures for Using Regression with Complex Survey Data: NELS:88 Example

Note that in this example,

- (1) SAS (WTED) overstates the size of the t statistic (75.8);
- (2) the use of the DEFT (square root of the design effect) of the dependent variable is very conservative, i.e., understates the magnitude of the test statistic (29.5);
- (3) the use of the average DEFT (averaged over levels of the independent variable) gave a t value close to that of SUDAAN (51.6 vs. 58.7);
- (4) the design effect for the regression coefficient was smaller than the design effect for the overall mean (2.57 - column 3) and smaller than the design effect of the subgroup means (1.46, 1.43, 1.33, 1.65 - column 4). This seems to be fairly consistent with what is found in the literature.

The finding that design effects for regression coefficients tend to be smaller than those of means is consistent with the results of a study by Frankel which found the following average design effects averaged across statistics of a given type for a 30 strata design:

Statistic	Mean deff
Mean	2.08
Regression Coeff	1.23
Correlation Coeff	2.00
