The National Center for Education Statistics (NCES) gathers and publishes information on the status and progress of education in the United States. The congressional authorization for these activities (with antecedents to 1867) states that the purpose of the Center is to collect and report "...statistics and information showing the condition and progress of education in the United States and other nations in order to promote and accelerate the improvement of American education."—Section 402(b) of the National Education Statistics Act of 1994 (20 U.S.C. 9001). This law also mandates an annual statistical report on the subject from the Commissioner of Education Statistics. This 1996 edition of *The Condition of Education* responds to the requirements of that law.

This report contains 60 indicators that shed light on the condition of education in the United States. These indicators represent a consensus of professional thinking on the most significant national measures of the condition and progress of education to date, but tempered by the availability of current, valid information. In the text that follows, I will summarize some of the positive developments in American education and point out areas that continue to raise concern. In addition, I will discuss what we know about school quality and describe how the conditions facing the schools have changed.

For some issues of public concern, however, there are no data available that can provide a satisfactory national picture of recent educational developments. One such area where additional work remains is in developing measures of learner outcomes that go beyond the core content areas. These might include measures of integrative reasoning and curriculum exposure. A second area where work remains is in developing better measures of school quality and student learning opportunities.¹

♦ *What are high school students studying and how are they performing?*

In the 13 years since *A Nation at Risk* advocated tougher course requirements for high school graduation, states and students have responded dramatically. **High school graduates are taking more courses overall, particularly academic courses.**² The proportion of students completing the "New Basics" curriculum

Percentage of high school graduates earning the recommended credits in *A Nation at Risk*

in English, mathematics, science, and social studies has increased (*Indicator 28*), and a greater percentage of students are taking Advanced Placement (AP) courses.³

In addition, **more students are taking geometry, trigonometry, and calculus as well as advanced science courses, including chemistry and physics** (*Indicator 29*). Both college-bound and non-college-bound students are taking more foreign language courses than their counterparts did a decade before.⁴ Furthermore, as of 1990, 42 of the 50 states had raised course requirements for high school graduation since the publication of *A Nation at Risk*, and 47 states had mandated student testing standards.⁵ Of course, these increases can only be considered good news if the content of these courses is at least as rigorous as it was when the National Commission on Excellence in Education made their recommendations. There is some evidence that it is, but we have no national data on the content of courses.⁶

It is also encouraging to see these improvements in high school course taking reflected in **gains in mathematics and science achievement**. Between 1982 and 1992, the mathematics and science proficiency scores of 17-year-olds on the

Mathematics proficiency scores of students

National Assessment of Educational Progress (NAEP) increased (9 scale points on each assessment). One way to get an idea of how much improvement these gains represent is to compare them to variations in proficiencies between different-aged high school students. Using this comparison, the improvement for 17-year-olds from 1982 to 1992 was roughly equivalent to an additional year or more of learning in high school (*Indicators 15 and 16*). These gains in NAEP

Science proficiency scores of students

proficiency scores are one indication that 17-year-olds in 1992 had made substantial progress in mathematics and science relative to their peers in 1982.

Although proficiency scores in reading and writing have not shown similar increases,⁷ **U.S. students compared favorably to their counterparts in other countries on an international assessment of basic reading literacy in 1991-92 (Indicator 20).** In an international comparison of the literacy skills of adults in 1994, the United States had a large concentration of adults score at the highest levels on the prose literacy domain. The United States also had a greater concentration of adults score at the lowest levels of literacy than most of the other countries, however (Indicator 21).

Supporting this finding of generally favorable performance of the nation's students in reading literacy, low performing students have also progressed academically since the publication of *A Nation at Risk*. For example, **dropout rates have declined (Indicator 5), and a greater percentage of dropouts are returning to earn a diploma or GED within 2 years of their scheduled graduation (Indicator 6); fewer high school students are taking remedial mathematics courses before graduating;⁸ and the mathematics and science proficiencies of the lowest performing 17-year-olds have increased (tables 15-3 and 16-3).** However, between 1984 and 1992, the reading and writing proficiencies of the lowest performing students remained relatively stable,⁹ and between 1992 and 1994, the reading performance of the poorest performing 12th-graders fell,¹⁰ just as it did for all 12th-graders (Indicator 15).

At the same time that **more students are taking AP examinations the science proficiency scores of the highest performing 17-year-olds have increased (table 16-3).** In addition, since the early 1980s, the mathematics proficiency scores of the highest performing 17-year-olds have remained relatively stable (table 15-3).

It is significant that even though the number of Scholastic Assessment Test (SAT) test-takers as a percentage of high school graduates has increased almost 9 percentage points since 1983, the average mathematics score has increased 14 points, and the average verbal score has increased 3 points (Indicator 22). These findings are considered by many to be particularly positive because increasing participation tends to push down scores.

When examining differences in averages across NAEP scores, we should keep in mind that the performance among students of the same age or in the same

Distribution of reading proficiency within age groups: 1992

grade varies considerably. For example, in reading, mathematics, and science, many students score no higher at age 17 than many of their peers did at age 9, despite the fact

that they differ by 8 years of schooling.¹¹ Schools must cope with this variation while trying to help each student learn as much as possible. It is not surprising, then, that there is also much variation across schools in the type of curriculum offered to students with different abilities and interests.¹²

As a nation, we put great value on mathematics and science. Recently, this has been expressed in Goal 5 of the National Education Goals: "U.S. students will be first in the world in science and mathematics achievement." **Although, as noted above, the mathematics and science scores of U.S. students have increased since the early 1980s, they remain low compared to their counterparts in many other countries (Indicators 23 and 24).** Moreover, considerable variation exists across states. On the one hand, 8th-grade students in some states perform as well as 13-year-old students from the best performing nations in an international comparison of mathematics achievement. On the other hand, students in other states are performing at levels similar to students in developing countries.¹³

♦ How are minorities performing?

Another area of continuing concern is the academic achievement of minority students in elementary and secondary school. For example, in 1994, the average reading proficiency scores of black 12th-graders were 29 scale points below those of white 12th-graders and were similar to the average proficiency

Average reading proficiency in 1994

scores of white 8th-graders. The white-Hispanic reading gap in 12th grade was a little narrower than white-black differences. White-black and white-Hispanic proficiency score differences were of similar magnitudes in mathematics in 1992.¹⁴ But, the white-black differences were greater than the white-Hispanic differences in science in 1990.¹⁵ Whites and Asians also scored higher than blacks and Hispanics on history (Indicator 18) and geography (Indicator 19) assessments.

Many also are concerned that despite a **narrowing of the white-minority achievement gap during the 1980s, particularly in mathematics, recent data raise the possibility that the gap is no longer closing.** For instance, the most recent (1994) NAEP results in reading suggest that minority groups may be

beginning to lose some of the earlier gains they had made relative to whites.¹⁶

In addition to some narrowing in the white-minority achievement gap, there are other positive developments regarding the achievement and attainment of black and Hispanic students. The indicators in this volume contain far more information on different subpopulations than has been reviewed here. For example, an essay on minorities in higher education appears in the *Issues in Focus* section, and essays reviewing the educational progress of Hispanic students and of black students appear in the 1995 and 1994 editions of the *Condition*, respectively. A review of the considerable educational advances made by women over the past several decades can also be found in the 1995 edition.

Social scientists attribute much of the white-minority differences in achievement to the higher incidence of poverty in the families of minority children (*Indicator 44*) and the lower average educational levels of their parents. It is difficult for schools to compensate for such disadvantages. However, **there is evidence that extraordinary schools and teachers make a difference in how all students perform.** For example, research on early intervention and one-to-one tutoring demonstrates that at-risk students can achieve at far higher levels than they have in the past.¹⁷ There is also some evidence, particularly in mathematics and science, that taking more challenging courses is related to higher performance and achievement.¹⁸

◆ Are more young people finishing high school?

Despite curricular changes that may have made school more difficult, students are persisting in their studies. Overall, **the percentage of students who leave high school before graduating has gradually declined, and differences between dropout rates for blacks and whites have also narrowed, although most of these changes occurred before the mid-1980s** (*Indicator 5*).

The decline in the dropout rate is encouraging because schools provide young people with the opportunity to explore their interests and develop their talents. It is also encouraging because staying in school is an important indication that a young person is learning to be a productive member of society and is less likely to suffer from poverty and unemployment (*Indicators 30, 32, 34, and 36*).

High school completion rates have gradually risen, and for some subgroups are near or over the 90 percent recommended in the National Education Goal

Median earnings of wage and salary workers aged 25-34 (in 1995 constant dollars)

(*Indicator 25*). The rise is, in part, a result of greater student persistence in

Median earnings of wage and salary workers aged 25-34 (in 1995 constant dollars)

Status of 1980 and 1990 sophomores who did not graduate on schedule 2 years after scheduled graduation

Legend: Graduated (light blue), Earned a GED (dark blue), Enrolled in high school or GED program (light grey), Dropout (dark grey)

high school (as discussed above), but may also be a result of more dropouts returning to earn a GED credential or regular diploma (*Indicator 6*). Although the rise is a positive development, we must also be cautious because in today's economy a high school diploma or a GED credential may not be sufficient to avoid low earnings, unemployment, and, possibly, poverty.

Since the early 1970s, the real wages of young adults with only a high school diploma or GED credential have declined (table 34-2), and the proportion of this group receiving AFDC or public assistance has increased (*Indicator 36*).

Generally, employment rates rise with education level (*Indicator 32*), and the likelihood of being involuntarily employed part time or part year declines (*Indicator 33*). The labor market opportunities for high school graduates are still better than for those who complete 9–11 years of education, however.

◆ *Are more young people going to college?*

In 1992, the rates of attainment in higher education for U.S. males and females were among the highest in the world (*Indicator 27*).¹⁹ This is an indication that higher education is broadly accessible in the United States compared to other

High school graduates who enrolled in college the October following graduation

countries. It is also an indication of the rewards of college attendance. Even though some college graduates have faced a difficult labor market over the past few years, their job opportunities and earnings are much better than those of high school graduates. In fact, through-out the 1980s, the earnings advantage for college graduates has grown stronger (*Indicator 34*).

It is not surprising that despite a rapid rise in tuition levels (*Indicator 12*) **more high school graduates are choosing to go immediately to college after high school graduation** (*Indicator 7*). It should be noted, however, that enrollments do not always translate into completions.

Although more students are entering college after high school, the data show that **it is very common for college students to enroll, leave, possibly return, and not finish within the expected period of time**. For example, among

1989–90 beginning postsecondary students seeking bachelor's degrees, fewer than half had graduated; 28 percent had neither completed nor were still working toward a bachelor's degree in spring 1994; and 8 percent had earned an associate's degree or a vocational certificate (*Indicator 10*). Among students who began their postsecondary education at a community college in 1989–90, less than one-quarter had completed an associate's degree or vocational certificate there by 1994, although 37 percent had completed an award at some institution. Those who did not complete an award at their initial community college spent a substantial amount of time there, however, averaging 14 months of enrollment (*Indicator 9*).

Non-completion is not necessarily an indication of failure or a waste of resources. Often students, particularly those at 2-year institutions, enter and withdraw from college because of economic opportunities, or they may have begun a program with limited objectives that they were able to achieve. Also, many students attend part time, which can extend the time it takes them to complete a program (*Indicator 11*). Nevertheless, the high rates of non-completion and interrupted attendance may indicate that students do not have enough information about the actual skills in demand in the labor market before making decisions regarding their education. Moreover, they may have unrealistic views as to how much time, effort, and money will be needed to complete postsecondary education programs and acquire these skills.

High levels of participation in higher education are made possible by generally low tuition levels at public institutions and a financial aid system that primarily is based, particularly the federal component, on need.

Average tuition and fees are also much lower at public institutions, where four out of five students are enrolled, than they are at private institutions (*Indicators 13 and 39*).

Costs incurred by dependent full-time undergraduates: 1992–93

Institution	Tuition and fees	Total cost	Net cost
Public 2-year	\$1,072	\$6,410	\$5,717
Public 4-year	2,947	9,187	7,326
Private 4-year	11,004	17,301	11,552

SOURCE: Indicator 13.

But to attend postsecondary education on a full-time basis requires that the student not only pay the direct costs of education but also finance living expenses. For example, in 1992–93, the *total cost* a student had to finance, including both

educational and living expenses, was about \$9,200 for dependent full-time students attending public 4-year institutions. Total aid, including grants, loans, and work-study, reduced the amount that needed to be financed to \$7,300. In addition, most financial aid is sensitive to family income, so this *net cost* was lowest (\$5,070) for students from low income families and highest (\$8,879) for those from high income families (*Indicator 13*).

Clearly, the increasing enrollment rates and rising tuition costs are profoundly affecting the nature of higher education. First, colleges are providing much remedial instruction to students who arrive with weak academic skills.²⁰ This may indicate that more students who once would not have considered continuing on to higher education are now enrolling, even though they must take courses for which they may not receive credit. Second, the percentage of full-time college students who report working more than 20 hours a week has increased since the early 1980s.²¹

Although working during the school year leaves less time for students to concentrate on their studies or to participate in extracurricular activities, some of the experience that students gain from working may benefit them after graduation. There is evidence, however, that working long hours while in college may reduce a student's likelihood of completing college or lengthen the time it takes for those who do complete it. Third, there is some evidence that college students are feeling increasingly stressed by the demands placed on them.²²

◆ *What do we know about the quality of our schools?*

The information presented so far has focused on students and what they are or are not achieving. Because of the impact of family income and support on student performance, academic achievement is only a partial indicator of the quality of the schools that U.S. students attend. But what can be said directly about the quality of schools? Are schools providing a safe and supportive environment so that student energies can be devoted to learning? Are schools attracting people with enthusiasm, creativity, and commitment to teaching and supporting them with competitive salaries and sustained professional development? These are also important aspects of school quality.²³ Without question, much work remains to be done to produce reliable statistical measures of school quality.

Expenditures per student are often used as a proxy measure of the quality of education. But, this can only be considered a highly imprecise measure, because the results of hundreds of studies that examine the relationship between spending and outcomes, such as achievement test scores, dropout rates, and higher education enrollments, are mixed.²⁴ Neither a strong nor consistent relationship is found. However, no one can deny the importance of money to build schools, hire teachers, buy textbooks, and otherwise acquire the resources needed to create a safe, supportive learning environment. Among these resources are the intangible qualities of dedicated teachers, principals, and parents who create the learning environment.

At the elementary and secondary levels, **revenues per student have increased substantially** since the early 1980s, a sign that even with the strains of slower economic growth, our nation is willing to continue supporting its schools (Indicator 50). Yet, **revenues per student vary widely across states**; state governments, not the federal government, have responsibility for funding education, and they vary in their capacity and willingness to do so. In addition, there is considerable variation within states, because states delegate authority for operating and funding schools to local school

Net cost incurred by and unmet need of dependent full-time undergraduates, by family income: 1992–93

Family income	Net cost		Unmet need	
	Public 4-year	Private 4-year	Public 4-year	Private 4-year
All	\$7,326	\$11,552	\$1,952	\$4,171
Less than \$27,000	5,070	5,872	3,132	4,425
27,000–44,999	6,426	8,590	2,429	4,980
45,000–59,999	7,598	10,407	1,784	4,204
60,000 or more	8,879	15,752	836	3,633

SOURCE: Indicator 13 and table 13-1.

districts. For instance, one estimate is that **the wealthiest districts have about 16 percent more cost-of-living adjusted revenue per student than the poorest districts**. However, other factors such as students' educational needs require consideration before disparities in the allocation of education resources can be adequately measured. Districts with a large percentage of school-age Revenues per student from public sources as a percentage of income per capita

children in poverty, however, do receive a much larger share of their revenue from federal and state sources than from local governments.²⁵

An advantage of state and local funding of schools is that parents and citizens have more say in deciding how much education their children get and with what emphasis. A disadvantage is that wealth varies across school districts, leading to imbalances in the resources available to schools even when citizens are equally willing to fund them. This has resulted in complicated state formulas to assist poor school districts and in many court challenges to state education financing systems as insufficiently compensatory. In fact, the supreme courts of several states have declared the state education financing systems unconstitutional because of funding inequities, and more than half the states have cases pending. For example, as a result of a court challenge to its funding arrangements, Kentucky has completely overhauled its educational system from teacher certification requirements to governance structures. And a few years ago, Michigan decided to stop using the property tax to finance its schools, and instead to use a combination of income and sales taxes. Since poor school districts receive most of their revenue from the state, another disadvantage of state and local funding is that economic conditions may cause a state

to change its support level at the very moment poor school districts need the funds the most.

Although the level and distribution of education resources are very important, it is equally important that the resources be used effectively. Teachers' salaries are a major portion of the elementary and secondary budget, and good teachers are central to a high quality education system. Most of what we consider formal childhood education takes place in classrooms through interactions between teachers and students. And, teachers are one conduit through which education and societal values are passed.

Since the mid-1950s, the pupil-teacher ratio has declined steadily.²⁶ Average teacher salaries in public schools were also higher in 1995 than in 1960, although most of the gain since 1981 only recouped losses incurred during the 1970s (*Indicator 55*). Nevertheless, using a variety of measures, it appears that **teacher earnings are relatively low compared to those of many other professions that college students could pursue.**²⁷ Policymakers have expressed some concern over whether this discourages the best and the brightest students from choosing teaching as a profession. However, evidence of this is mixed. For example, **some research**

Average annual salaries of public school teachers
(in 1995 constant dollars)

indicates that those accepting teaching positions were more likely to have lower scores on the SAT and NTE (National Teacher Examination) than non-teaching college graduates, and that those leaving teaching were more likely to have higher SAT and NTE scores than those remaining in the profession.²⁸ Evidence from the 1992 National Adult Literacy Survey (NALS) points in the opposite direction, however. In NALS, **the prose literacy scores of teachers are similar to the scores of many of their colleagues in other professions,** including private-sector executives and managers, engineers, physicians, writers and artists, social workers, sales representatives, education administrators, and registered nurses. Thus, with respect to at least prose literacy, there is little evidence that low salaries are attracting only the least able college graduates into teaching (*Indicator 58*).

Although many of the characteristics that determine the quality of a teacher are not easily measured, some teacher qualifications can be measured. Many analysts argue that one of the most important characteristics is training and preparation in the subject or field in which the teacher is teaching. Research has shown moderate but consistent support for the reasonable proposition that subject

knowledge (knowing what you teach) and teaching skills (knowing how to teach) are important predictors of both teaching quality and student learning.²⁹ Knowledge of subject matter and of pedagogical methods does not, of course, guarantee quality teaching, but it is an important prerequisite.

Almost all teachers are certified to teach in their primary assignment field, and a large majority have majored or minored in this field. In fact, most teachers have graduate degrees. In school year 1993–94, the proportion of public secondary school students taught by a teacher who either majored or minored in their class subject ranged from 78 percent in mathematics to 93 percent in health and physical education (*Indicator 57*).

Percentage of public secondary school students taught by teachers who majored or minored in the class subject:
1993–94

There is considerable variation in teacher qualifications across states, however. For example, in 1991, the percentage of high school mathematics teachers who majored in mathematics or mathematics education ranged from 44 percent in California to about 90 percent in Alabama and Minnesota.³⁰ Although teacher qualifications and credentials may be an indication of minimal competency, these may be poor measures of subject matter and instructional competence.

To provide high quality education, schools must not only hire well qualified teachers but also must help current teachers improve their skills, stay current in their fields, and learn about new teaching methods. **In 1993–94, the vast majority of full-time public school teachers participated in school- and district-sponsored workshops or in-service training** (*Indicator 59*).

Considerable policy discussion has addressed the ability of schools to keep qualified teachers, both in general and in specific subject areas such as mathematics and science. **Overall, teacher attrition in public elementary and secondary schools seems to be low.** Only 1 in 20 full-time public school teachers left the teaching profession between the 1990–91 and 1991–92 school years. Furthermore, keeping mathematics and science teachers in the profession does not seem to be as big a problem as was once suggested. The percentage of full-time teachers in public secondary schools in 1990–91 who left teaching in the next year was no higher in mathematics and science than in other teaching fields.³¹

A high level of education and associated professional commitment among teachers benefits both students and the education system. These benefits come at a cost, however,

because teachers must be paid enough to justify the investment they have made in their education. Nevertheless, education policymakers must address the more difficult issue of how to make the best use of available resources under changing conditions.

♦ *How have conditions facing the schools changed?*

Changing conditions that schools must confront are putting additional strains on revenues, even though revenues have increased. **First, schools are facing a period of rising enrollments after a long period of decline** (*Indicator 38*). It is important to monitor these increases because they will affect school budgets as well as policies of teacher recruitment and retention.

Second, many more disabled students, particularly those with learning disabilities, are receiving special services (*Indicator 43*). This has major financial implications for school districts.

There is some evidence that the average cost of serving a special education student is as much as 2.3 times the cost of serving a regular student (ranging from 1.9 times for students in resource programs to 10.6 times for students in residential programs).³²

Third, many more students speak a language other than English at home and have difficulty speaking English, a likely indication that even more students may have difficulty reading and writing English.³³

By law, school systems nationwide must provide services for children from non-English-language backgrounds. Because these students are disproportionately concentrated in a few states (California, Texas, New Mexico, Arizona, and New York), the education systems in these states are under

Percentage of children served in federally supported programs for students with disabilities

Percentage of children who have difficulty speaking English

particular strain to respond to the special needs of these children.

Fourth, many children live in poverty (21 percent or 15.3 million), and these children typically live in neighborhoods and attend school together (*Indicator 44*). Thus, the schools in these neighborhoods are also facing heavy demands.

Percentage of children living in poverty in 1992

Fifth, an increasing percentage of public school teachers are reporting that physical conflicts and weapons possession are moderate or serious problems in their schools. Violence in and around schools directly affects educators and students by reducing school effectiveness and

Percentages of public school teachers reporting physical conflicts among students and weapons possession as moderate or serious problems in their schools

inhibiting students' learning. In 1993, more than one in five high school seniors reported being threatened at school.

Despite teachers' perceptions of growing safety problems in their schools,³⁴ victimization rates of high school seniors changed little between 1976 and 1993, except for a slight increase in the percentage of students who reported being threatened, both with and without a weapon. Although generally few differences were seen in school victimization

rates among black and white high school seniors, black seniors were more likely than their white counterparts to have been threatened with a weapon at school (24 versus 14 percent).³⁵

As this discussion indicates, there is not one answer to the complex question of whether the condition of education is improving. Some conditions are improving, while others are not. In a number of areas, research has not been able to disentangle the influences of several factors; therefore, we cannot be certain whether conditions are actually improving or not. However, this volume can help Americans interested in education policy to pose more sophisticated questions. In doing so, we can make progress toward understanding what produces high quality educational institutions, an educated citizenry, and a skilled work force.

Jeanne E. Griffith

“Why do we seek to know the condition of education? In the answer to this question will be found the reasons for the elaborate statistical record which forms a feature of all official school reports. We take an account of education so that we may know whether it is sufficient in amount and good in quality.”

Henry Barnard
First Commissioner of Education

Introduction

During the 1980s, the country became increasingly aware of a range of critical national issues facing education. These issues included concerns about all children having an equal opportunity to receive a high quality education, general low academic performance, drug use and violence in the schools, unacceptably high dropout rates, the high cost of a college education, and the skills of workers lagging behind technological changes in the workplace. The 1990s have continued the emphasis expressed in the 1980s, with renewed concern over academic standards and school finance reform. These concerns continue to have serious implications, not only for schools and colleges but also for the future of individual citizens, U.S. economic competitiveness, and ultimately the structure and cohesiveness of American society and culture.

The Condition of Education provides a means to report where progress is being made in education and where it is not, to draw attention to emerging issues, and to inform the ongoing policy debate.

The structure of *The Condition of Education*

A quick tour of the volume may help readers make the best use of it. The core of the volume consists of 60 indicators. Each indicator is presented on two pages, with findings summarized in accompanying text, tables, and graphics. Also included in the back of the volume are supplemental tables providing additional details, and sometimes an explanatory note on a technical or data-related issue.

The 60 indicators are organized into six sections:

- ◆ Access, Participation, and Progress;
- ◆ Achievement, Attainment, and Curriculum;
- ◆ Economic and Other Outcomes of Education;
- ◆ Size, Growth, and Output of Educational Institutions;
- ◆ Climate, Classrooms, and Diversity in Educational Institutions; and
- ◆ Human and Financial Resources of Educational Institutions.

Instead of separating the indicators on elementary and secondary education from those on postsecondary education, the volume integrates issues ranging from early childhood education to postsecondary education into each of the six sections.

One can find information on an issue either by turning to the table of contents, which lists the 60 indicators, or by using the index, which references not only the indicators but also the supplemental tables. When an updated indicator is not available in this volume, the index lists the indicator number and edition of *The Condition of Education* that last published an indicator on that topic. Supplemental material also can be downloaded from the NCES World Wide Web (WWW) Site.

Preceding each section of indicators is a two-page overview that interprets and summarizes some of the findings in that section as they relate to an important issue.

At the bottom of each indicator page, readers can locate the data source for the indicator. The indicators presented in this report have been developed using data from studies carried out by NCES as well as from surveys conducted elsewhere, both within and outside of the federal government. A description of each source is provided in the *Sources of Data* section. Sometimes more knowledge about the type of survey used to gather the data can help readers interpret the indicator. Because some of the terms

used may not be familiar to all readers, we also have included a glossary.

In the *Issues in Focus* section, we pull together evidence from both the 60 indicators and other sources on four important education issues:

- ◆ Education and worker productivity;
- ◆ Preparation for work;
- ◆ Minorities in higher education; and
- ◆ Teachers' working conditions.

These issues were selected, first because of their importance to current policy discussions, and second because a substantial amount of new information on these issues has been included in this volume and other recent NCES publications.

In the 1995 edition of *The Condition of Education*, essays were included on access to preschool education, trends in the achievement and attainment of Hispanic students relative to whites, progress in the achievement and attainment of women, and the cost of higher education.

References to indicators and tables contained in this volume appear in parentheses. The tables cited are in the *Supplemental Tables and Notes* section of the publication. Occasionally, there are references to indicators found in a previous edition of *The Condition of Education*; these can be recognized by the year following the reference. References to sources other than *The Condition of Education* are footnoted.

Issues in Focus

Education and Worker Productivity

The productivity of the U.S. workforce is a primary determinant of the standard of living of the U.S. population. Productivity is affected by many factors, including the education and skills of the workforce. Education and skills are important because they expand workers' capacity to perform tasks or to use productive technologies. In addition, better educated workers are typically better able to adapt to new tasks or to changes in old tasks. Education may also prepare workers to work more effectively in teams because it enhances their ability to communicate with and understand their co-workers.

Much of the recent concern about the productivity of U.S. workers has been prompted by uncertainty about the ability of domestic firms and workers to compete in an increasingly international marketplace. As U.S. productivity growth has slowed in the past two decades and other countries achieve productivity levels similar to the U.S., concern about U.S. competitiveness has increased. Some attribute the loss of the U.S. productivity advantage to the limited ability of the U.S. educational system to provide students with the skills necessary to succeed in the modern labor market.

Variability in the quality and quantity of education across countries is only one factor contributing to differences in worker productivity--capital investment, technical innovation, foreign trade, and government regulation can also affect productivity. But education remains an important contributor to productivity growth and therefore has a major influence on the standard of living. This essay highlights several measures of productivity and education, and addresses the link between these two sets of measures. A better understanding of the relationship between worker productivity and the condition of education is essential to understanding how investment in education contributes to the U.S. economy.

Trends in Worker Productivity and the Contribution of Education

- *Worker productivity in the U.S. has increased continuously since the end of World War II, but growth has been slower since 1973 than before 1973.*

Worker productivity in the U.S. has grown nearly continuously since the end of World War II, rising to a level in 1994 that is approximately three times that of 1947. Postwar growth in productivity was slower after 1973 than it was before 1973. Between 1947 and 1973, output per hour increased by nearly 3 percent per year, compared with slightly more than one percent per year between 1973 and 1993. It is unclear whether the slowdown in productivity growth since 1973 merely reflects fluctuation around the long-term growth rate, which is equal to about 2 percent, or signals slower long-run growth.

SOURCE: U.S. Department of Labor, Bureau of Labor Statistics, based on Data from the Current Employment Statistics, the Current Population Survey, and the national income and product accounts produced by the U.S. Department of Commerce, Bureau of Economic Analysis.

• *Since World War II, worker productivity has grown more slowly in the U.S. than in other industrialized countries.*

For several decades, productivity in other industrialized countries has been gradually catching up to that in the U.S. However, the U.S. remained the leader as of 1990, with Gross Domestic Product (GDP) per worker that was slightly higher than that in Canada and about 25 percent higher than that in Italy, the third highest country.

Real GDP per worker in G-7 nations: 1950–90

SOURCE: Penn World Table (Mark 5.6), distributed by the National Bureau Economic Research.

According to one theory of productivity growth, referred to as the *convergence hypothesis*,¹ it is to be expected that productivity in lagging countries will converge on that of the U.S. because these countries can exploit technologies transferred from the U.S. and thereby close the gap in worker productivity. This “catching-up” process suggests that the U.S. is inevitably at risk of losing its lead in worker productivity as long as other countries have the factors, such as an adequately educated workforce, to exploit new productive technologies. The ability of the U.S. to maintain a substantial lead in productivity for nearly a century is at least partly attributable to

the two world wars, which destroyed the productive capacity of other countries while spurring technological innovation in U.S. manufacturing. It now appears that the other industrialized countries will eventually share the lead in productivity with the U.S. But insofar as the “catching up” process involves the transfer of technology from the leader country to the lagging countries, the process should eventually slow down as the lagging countries exhaust their opportunities to exploit new technologies from the leader.

• *Education is an important determinant of worker productivity.*

Increases in educational attainment are responsible for an estimated 10 to 20 percent of growth in worker productivity in the U.S. in recent decades.² These estimates are similar to those for other industrialized countries.³ The industrialized countries with the highest productivity levels generally have highly-educated workforces. The convergence in productivity among these countries parallels their convergence in educational attainment.

Factors other than education are also important to worker productivity. For example, increases in capital accounted for an estimated 40 percent of productivity growth in the U.S. between 1948 and 1990.⁴ In the early 1960s, when the U.S. was the dominant economy in the world, the nation had a much higher ratio of capital to labor than other industrialized countries. Since then, the countries that are catching up to the U.S. in terms of productivity have accumulated capital at a faster rate than the U.S. In addition to capital, such factors as technical innovation, foreign trade, and government regulation, can also affect productivity.

The Economic Consequences of Education for Individuals

Ultimately, growth in a nation’s productivity results from growth in productivity of individual workers. The best available measure of a worker’s productivity is typically that worker’s wages, as employers generally pay wages equal to the marginal productivity of their workers. The impact of education on the productivity of workers can be determined by estimating the

impact of education on wages. Education may also improve workers' employment stability, enabling more educated workers to maintain their jobs or to quickly find new jobs in the face of changing economic conditions. The association between education and unemployment therefore can be a further indication of the effect of education on the productivity of workers.

Educational Attainment

- *Workers with higher educational attainment are unemployed less and earn more than workers with lower educational attainment.*

Over the past 30 years, a substantial proportion of high school graduates and dropouts were unemployed shortly after leaving high school, with dropouts generally facing a higher unemployment rate than graduates. In 1994, 30 percent of recent dropouts compared with 20 percent of recent graduates not enrolled in college were unemployed. The unemployment rates for both groups have increased since 1960.

Unemployment of recent school leavers, by educational attainment: 1960–94

Median earnings are positively associated with educational attainment. Among males 25 to 34 years old in 1994, median earnings of those with a

college degree were equal to about \$33,000 per year, which was more than 50 percent greater than the median earnings of high school graduates and nearly twice the earnings of high school dropouts. The relationship between education and earnings for females is similar, although within each educational category, earnings are lower for females than for males.

Earnings of wage and salary workers aged 25–24, by educational attainment and sex: 1994

SOURCE: U.S. Department of Commerce, Bureau of the Census, March Current Population Survey.

- *Educational attainment in the U.S. has increased over the past 20 years.*

The high school completion rate for 21- and 22-year-olds increased slowly from approximately 82 percent in 1972 to about 86 percent in 1990. Subsequently, the rate remained relatively constant between 1990 and 1994. An increasing number of students who finish high school also move on to college. The college enrollment rate among recent high school graduates increased from 49 percent in 1972 to 62 percent in 1994.

But many students who enroll in college do not complete four years of college. The rate of completion of 4 years or more of college increased by about 5 percentage points between 1972 and 1976, but it then declined for several years before

starting to slowly increase again. The completion rate of 28 percent in 1995 was similar to the rate of 20 years before.

High school completion, college enrollment, and college completion rates: 1972–95

- *Educational attainment is increasing more slowly in the U.S. than in other industrialized countries, but the rate of college completion in the U.S. still far exceeds that in most other countries.*

In each of the G-7 countries, the rate of secondary school completion is higher among 25- to 34-year-olds than among 25- to 64-year-olds, indicating that the rate of secondary school completion is increasing in the countries. The gap between the completion rates of younger and older workers is larger in other G-7 countries than in the U.S., suggesting that secondary school attainment is increasing at a faster rate in the other countries. The high school completion rates for young adults in Japan and Germany are now higher than the U.S. rate, while Canada and the U.K. have nearly caught up to the U.S.

Secondary school completion: 1992

NOTE: In the United States, completing secondary school is defined as graduating from high school or earning a GED.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The Condition of Education*, 1995.

Most G-7 countries still lag well behind the U.S. in postsecondary attainment. The proportion of the population age 25 to 64 that has completed a college education is by far the highest in the U.S. The U.S. lead is smaller for adults age 25 to 34, but only Japan has a rate of postsecondary attainment among young adults comparable to that in the U.S. Japan has nearly caught up to the U.S. because the rate of college completion among young American adults has changed little for 20 years, while that in Japan has risen dramatically. The rate of postsecondary attainment in most other G-7 countries has increased more slowly than in Japan, as indicated by the smaller attainment gaps between younger and older adults in those countries.

Completion of higher education: 1992

NOTE: In the United States, completing higher education is defined as earning a bachelor's degree.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The Condition of Education*, 1995.

Unemployment of 28-year-old workers, by ASVAB score quartile: 1985-93

NOTE: ASVAB is the Armed Services Vocational Aptitude Battery. To control for differences in age at testing, individuals were assigned to age-specific performance quartiles for each subject area based on their age at testing.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Longitudinal Survey of Youth.

Academic Achievement

- Workers who have a record of high academic achievement, as measured by achievement test scores, are unemployed less and earn more than workers with lower scores.

Workers who are 28 years old and previously scored in the top quartile on the Armed Service Vocational Aptitude Battery (ASVAB) mathematics, science, or paragraph comprehension tests have a lower unemployment rate than other workers. For example, 2.5 percent of workers in the top quartile of the mathematics test are unemployed, compared with 7.7 percent of workers in the other three quartiles combined.

Workers in the top quartile on the tests in each subject also earn more, on average, than other workers. Workers in the top quartile on the mathematics test, for example, earn an average of \$13.52 per hour compared with an average of \$10.05 per hour for workers in the other three quartiles combined.

Mean hourly rate of pay for 28-year-old workers, by ASVAB score quartile: 1985–93

NOTE: ASVAB is the Armed Services Vocational Aptitude Battery. To control for differences in age at testing, individuals were assigned to age-specific performance quartiles for each subject area based on their age at testing.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Longitudinal Survey of Youth.

- Tests scores of U.S. students generally increased in the 1980s and 1990s, offsetting declines that occurred during the 1970s.

Among 17-year-old students, National Assessment of Educational Progress (NAEP) test scores increased between 1982 and 1992. Increases in mathematics and science scores reversed a trend of declining scores that existed throughout the 1970s. By 1992, the scores in these subjects had recovered to the 1973 levels. NAEP reading scores of 17-year-old students have increased slowly and steadily since the early 1970s.

Trends in average achievement of 17-year-olds in mathematics, reading, and science: 1969–92

SOURCE: U.S. Department of Education, The National Assessment of Educational Progress: 1992 Trends in Academic Progress.

- U.S. students trail students from many other countries in mathematics and science achievement, but U.S. students tend to lead in reading achievement.

Most of the countries included in a 1991 international study of achievement outperformed the U.S. in mathematics achievement of both 9-year-old and 13-year-old students. With respect to science achievement, 9-year-old U.S. students performed as well as students in most other countries, but 13-year-old U.S. students tended to lag their counterparts in the other countries. In reading, the U.S. led all other countries but one for 9-year-olds and about half the other countries for 14-year-olds.

International distribution of academic achievement relative to the United States, 1991–92

Subject and age	Number of countries performing:			Number of countries in the study
	Significantly higher than the U.S.	Not significantly different from the U.S.	Significantly lower than the U.S.	
Mathematics				
9-year-olds	7	1	1	10
13-year-old	12	1	1	15
Science				
9-year-olds	1	4	4	10
13-year-old	10	2	2	15
Reading				
9-year-olds	1	0	21	23
14-year-old	3	9	10	23

Adult Literacy

A 1992 study tested the performance of U.S. adults on three scales of literacy--prose, document, and quantitative literacy--and categorized adults into five literacy levels according to their test scores, with level 1 being the lowest literacy level and level 5 being the highest.

- *Workers with higher literacy are unemployed less and earn more than workers with lower literacy.*

Unemployment rates are especially high for workers in the two lowest levels of literacy--1 and 2--on each of the literacy scales. For these workers, the unemployment rate ranges from 12 percent for workers with level 2 quantitative literacy up to 20 percent for those with level 1 quantitative literacy. Unemployment rates for individuals in the two highest literacy levels--4 and 5--are less than 6 percent.

Unemployment of civilian noninstitutionalized adults, by proficiency level on three literacy scales: 1992

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Adult Literacy Survey.

Workers with high literacy earn more than other workers, on average. On the prose scale, for example, full-time workers in level 3 earn a mean weekly wage that is 51 percent higher than the mean wage for their counterparts in level 1. Those in level 5 earn a weekly wage that is nearly 80 percent higher than the wage of those in level 3.

Mean weekly earnings of those employed full-time, by proficiency level on three adult literacy scales: 1992

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Adult Literacy Survey.

- The literacy proficiency of a substantial proportion of the U.S. labor force is limited, and only a small proportion of workers perform at a high literacy level.

Forty percent or more of the adult labor force perform at the two lowest levels on each of the literacy proficiency scales, suggesting that many workers lack the skills needed to interpret, integrate, and compare or contrast information using written materials common to the home or workplace. These workers appear to be unable to perform the types of tasks that are typical of certain occupations that demand high skills, such as professional, managerial, technical, high-level sales, skilled clerical, or craft and precision production occupations. Five percent or fewer of U.S. labor force participants scored in the highest proficiency levels by demonstrating an ability to perform well on a wide array of literacy tasks.

Percentage of the labor force in each proficiency level on three literacy scales: 1992

SOURCE: U.S. Department of Education, National Center of Education Statistics, National Adult Literacy Survey.

- Literacy of the U.S. adult population is, on average, roughly similar to that of populations of other industrialized countries, but the U.S. has a somewhat greater proportion of adults at the lowest literacy levels.

On average, the proportion of the U.S. population in the highest literacy levels is similar to that in the other countries included in an international study of adult literacy. However, the U.S. has a higher concentration of adults in the lowest literacy level than nearly all of the other countries. More than 20 percent of the U.S. sample is at the lowest literacy level on each of the three literacy tests, while the samples in other countries (except Poland) have less than 20 percent at the lowest level on each test.

Estimated percentage of the population in each proficiency level on three adult literacy scales, by selected countries: 1994

SOURCE: Organization for Economic Co-operation and Development and Statistics Canada, *Literacy, Economy and Society: Results of the First International Adult Literacy Survey: 1995*.

Summary

Workers in the U.S. are still more productive, on average, than workers in any other country. However, worker productivity in several industrialized countries is gradually catching up to that in the U.S., and eventually the U.S. is likely to share the lead in worker productivity. This convergence in productivity is attributable, in part, to the rapid expansion of education in other countries. The education of the workforce, according to at least some measures that contribute to economic success, is growing more rapidly in other countries than in the U. S. But education is not the only determinant of worker productivity, and other factors have no doubt have also played important roles in the rapid productivity growth in other countries.

Although the U.S. leads almost every other industrialized country in college attainment, and the academic achievement of U.S. students has been improving in recent years, U.S. students tend to lag students in other countries with respect to some measures of achievement. In particular, the math and science scores of U.S. students, especially older students, lag behind those of similar students in other industrialized

countries. U.S. students do, however, perform relatively well on reading tests. Adults in the U.S. may also not be as skilled in some areas as their counterparts in other countries. The U.S. has a higher concentration of adults in the lowest literacy levels than other countries that have tested literacy.

Preparation for work

by Elliott Medrich, MPR Associates, Inc.

Growing interest among policymakers, educators, and employers in the changing nature of work reflects two concerns: 1) today's workplace requires a range of capabilities that are quite different from the workplace of the past; and 2) schools could do more to teach students the skills that would be useful to them when they enter the labor force.

Ensuring that all students are ready for work, especially those who do not attend 4-year postsecondary institutions, requires a considerable reappraisal of the relationship between school and the workplace. What must be done to ensure that those entering the labor force have the training that is necessary for success in an increasingly competitive economic environment? What kinds of training and exposure—at school and in the workplace—will enable young people to achieve quality employment and high wages throughout their working life?

The equation is further complicated by the emergence of “high performance” work organizations. This new way of working reflects increasing attachment throughout the economy to new information technology. Success in the future work force will require flexible skills and learning capabilities, and making personal commitments to training and retraining throughout one's career.

Data below are presented on several issues that are central to the process of work preparation: course-taking patterns among high school and postsecondary students; student work experience as it relates to preparation for entry into the labor force; and adult involvement in education and training while employed.

Enrollment and course taking in preparation for work

High school

Since the 1970s, states have been tightening high school graduation requirements in “core subject”

areas. Most states have increased the number of courses students seeking a diploma must

SOURCE: Indicator 28, *Condition 1996*.

complete in English, social studies, science, and mathematics.¹ To some extent, these changes have paralleled recommendations of the National Commission on Excellence in Education. The Commission's 1983 report, *A Nation at Risk*, which argued the case for strengthening course-taking requirements in these subject areas, became an anchor of the school reform movement.

Other research, more specifically concerned with workplace and employment skills, also recognized the importance of improving the basic academic capabilities of high school graduates. For example, in 1991, the Secretary's Commission on Achieving Necessary Skills (SCANS) identified the types of skills young people need in order to enter and succeed in the labor market.² The "foundation skills" described by SCANS, which were similar to those recommended in *A Nation at Risk*, closely followed the framework of course-taking requirements in academic areas that the states were adopting.³

The confluence of enhanced academic standards and workplace-readiness standards is no accident. A student who is well prepared for the challenges of the future workplace should have a strong academic background without regard to his or her specific job or career-related objectives.

♦ *High school graduates are taking more courses in academic core subjects.*

The range of curricula reforms and the number of standards introduced have been substantial. Between 1982 and 1994, the percentage of high school graduates earning the recommended units in core courses increased sharply. This was true both among states with more restrictive and those with less restrictive laws governing academic course-taking requirements for high school graduation. It was also true both for students enrolled in academic programs and those enrolled in vocational programs (Indicator 28, *Condition 1996*).

Students have also been earning fewer vocational units. Between 1982 and 1992, while academic units increased from 14.1 to 17.4, vocational units declined from 4.6 to 3.8, a further indication of a trend toward focusing on academic coursework during high school (Indicator 23, *Condition 1994*).

SOURCE: Indicator 5 *Condition 1995*.

♦ *High school graduates in 1992 were more likely than their counterparts in 1982 to have taken mathematics courses at the level of algebra 1 or*

higher, and science courses at the level of biology or higher.

Changes in overall student course-taking patterns are further reflected in changes in student course-taking patterns in mathematics and

Percentage of high school graduates who took selected mathematics and science courses in high school: 1982 and 1992

SOURCE: Indicator 29, *Condition 1996*.

science. This is an important development, as these fields of study often require higher level thinking skills to solve complex problems—skills that are increasingly required in the workplace. Between 1982 and 1992, the proportions of students taking coursework in both subject areas have changed substantially, especially at advanced levels.

- ◆ *High school students' access to and use of computers increased substantially between 1984 and 1993.*

Computers are an important reality in the workplace, and computer literacy is becoming essential to functioning effectively in society. In this respect, the schools are a valuable venue for training and developing student computer skills. Further, there is evidence suggesting that the infusion of technology in the classroom has implications for student learning as well. A

recent study notes that using technology to support instruction improved student outcomes in language arts, mathematics, social studies, and science.⁴

The proportion of students with access to a computer at school or at home doubled between 1984 and 1993. Without regard to income, the majority of students in 1993 had access to a computer at school. However, a substantial gap in computer use exists outside school: students from higher income families were much more likely than students from middle or low income families to have a computer available to them at home.

- ◆ *Proficiency levels of 17-year-olds have improved in mathematics and science since the late 1970s.*

Proficiency in crucial subject areas is one way of measuring the capabilities of young adults as they enter the labor force. Between the late 1970s and 1992, proficiency scores among 17-year-olds in mathematics and science, as measured by NAEP, have improved, while reading proficiency has remained stable. The 9 scale point increase in mathematics proficiency between 1982 and 1992,

Average mathematics and science proficiency (scale scores) of 17-year-olds: 1977–92

Year	Mathematics	Science
1977	—	290
1978	300	—
1982	298	283
1986	302	288
1990	305	290
1992	307	294

— Not available.

SOURCE: Indicators 15 and 16, *Condition 1996*.

and the 11 scale point increase in science proficiency are particularly notable, as this is roughly the equivalent of the gain in proficiency with 1 year of age. These improvements in proficiency suggest that students are better prepared than they have been previously in fields of study that are key to success in advanced academics and for performance in an increasingly technical work environment.

Postsecondary education

Considerable evidence documents the lifelong employment and earnings advantage of advanced education and training.⁵ While solid high school preparation may have some meaning in the labor force, advanced training through postsecondary education provides additional, substantial benefits.

- ◆ *Increasing proportions of high school graduates are entering postsecondary education immediately after high school.*

High school graduates are considerably more likely to continue their education immediately after graduation than they were previously. In 1994, 62 percent of high school graduates enrolled in college the October following graduation, up from 47 percent in 1973. Postsecondary enrollment patterns over time have differed for males and females, with college enrollment rates for females increasing more than for males,

Percentage of high school graduates aged 16–24 who enrolled in college the October following graduation: 1973, 1983, and 1994

Characteristics	1973	1983	1994

4-year college	28	35	44

SOURCE: Indicator 7 and table 7-1, *Condition 1996*.

especially at 4-year colleges and institutions.

Differences in fields of concentration and course-taking patterns at subbaccalaureate and baccalaureate levels suggest substantial variation in work force preparation and employment opportunities following the completion of training.

- ◆ *Postsecondary subbaccalaureate degree majors vary considerably by sex and race/ethnicity.*

Students' focus in postsecondary education, as reflected in degree majors, provides insight into the depth, breadth, and direction of their training. While some graduates of subbaccalaureate programs go on to 4-year colleges and

institutions, for many an associate's degree is the final degree that provides job-related training. Differences between the sexes in fields of study are substantial. Among white, black, and Hispanic recipients of associate's degrees in 1991, females were more likely than males to complete a degree in business or health, while males were more likely to complete a degree in technological fields (e.g., computer and information sciences, engineering, and science technologies) (Indicator 29, *Condition 1994*).

- ◆ *At the baccalaureate level, students are paying more attention to applied fields of study, as compared to a more general, liberal arts education.*

Changing opportunities within the job market can affect students' decisions about their coursework and their major field of study. At the baccalaureate level, data are limited to percentages of students who took one or more courses in selected subjects in 1985–86, but differences in course-taking patterns are evident.

Males were much more likely than females to have taken courses in physical sciences, mathematics, computer science, engineering, and economics. Females were more likely than males to have taken life sciences, psychology, and

Psychology	65	60	72
Sociology/ anthropology	61	56	66

SOURCE: Indicator 28, *Condition 1994*.

sociology and less likely to have taken political science and economics.

The distribution of degrees conferred across fields suggest the kinds of skills and capabilities that students want, or believe they should have, before they enter the work force on a full-time basis. Five fields of study accounted for 72 percent of all bachelor's degrees conferred in 1991. Business and management, social and behavioral sciences, humanities, education, and engineering—in that order—were the five fields of study in which most degrees were conferred in 1991. In 1971, these same five fields had represented 80 percent of bachelor's degrees conferred.

Working while enrolled

Employment while in high school

- ◆ *Many high school students are exposed to the world of work—nearly 30 percent work at least part time.*

High school students work for many reasons. While employment may have some negative impact on students' school experience and their study time, especially if too much time is spent at work, workplace exposure can help students prepare for future, full-time employment.

Among all high school students aged 16–24 in 1992, 30 percent were employed. The total percent employed in 1992 was about the same as that in 1982, and less than that in 1972. In 1992, males were somewhat more likely to be employed than females, and whites were considerably more likely to be employed than were blacks or Hispanics.

Employment while in college

- ◆ *Among 16- to 24-year-old college students in 1993, almost half of full-time students and 85 percent of part-time students were employed.*

While work experience during college may or may not be associated with a student's major or career aspirations, work is now part of the postsecondary experience for many students. Employment while enrolled in college may, at the least, provide students with the resources they need to be able to continue their college education and may also give students a better idea of the needs and standards of the workplace.

At the same time, it may reduce a student's prospects for completing college or may lengthen the time it takes for those who work to complete their education and training.

In 1993, nearly half (46 percent) of all 16- to 24-year-old full-time college students were

employed, and about one-fourth worked at least 20 hours per week. Even more part-time students worked. About the same proportion of part-time college students worked in 1993 as did in 1973. In 1993, full-time college students from high income families were less likely to be employed than were full-time students from middle or low income families. In contrast, part-time college students from high income families were more likely to be employed than were students from middle or low income families.

Enrollment and education while working

Some occupations require continuing education of varying amount and intensity, but in general, adult education provides an important

SOURCE: Indicator 14, Condition 1996.

opportunity for those who are already employed to keep pace with rapid changes in the workplace. Participation rates may indicate the importance of lifelong learning as a condition of employment in the future labor force. Fully 21 percent of all adults participated in adult education in 1995 for work-related purposes.

Among those who participated in work-related courses, the majority took courses provided by businesses or professional associations. Others took work-related courses mostly provided by colleges or government agencies.

Ultimately, success in the workplace may require a lifelong commitment to training and personal skill building. In 1991, almost one-third of workers aged 16 and over had received some skill improvement training in their current job at some time during the 12 preceding months. Workers

with higher levels of educational attainment were much more likely to receive training than were those with less education. Finally, workers in executive, professional, and technical occupations, followed by those in sales and administrative support, were most likely to receive such training on the job.

Summary

In summary, course-taking patterns at the secondary level, and course-taking and degree major patterns at the postsecondary level, suggest that students are increasingly focused on preparing for the rigors of the labor market. In high school, students are taking more courses in academic core subjects and in higher level mathematics and science courses. They also have considerably more exposure to computers than they did a decade ago. In addition, more students are entering postsecondary education immediately after high school to pursue advanced education and training before entering the labor market.

At both the secondary and postsecondary levels, many students are employed while enrolled, which offers them some opportunity for exposure to the work environment. Once individuals enter the labor force, there is considerable opportunity for them to continue training. For example, many adults participate in adult education for work-related purposes, and many receive some skill improvement training in their jobs.

Minorities in higher education

by Thomas M. Smith, NCES

Minorities in the United States have long suffered lower economic prosperity and social status relative to the white majority. Higher education often serves as the best means of social mobility available to our nation's young people. For example, graduating from college is associated with more stable patterns of employment and higher earnings. As the gap in earnings between high school and college graduates continues to widen, attending college has become even more important for minorities who are trying to enter into a globally competitive labor market. This essay reviews the higher education aspirations and preparation, college enrollment, persistence, and completion rates of minorities in comparison with the majority white population. For the purpose of this essay, the Office of Management and Budget (OMB) standard classification scheme is used, and the categories of black, Hispanic, Asian/Pacific Islander, and American Indian/Alaskan Native are used to denote racial/ethnic minority groups. In the data used for many comparisons, however, the sample size of the two latter groups is too small for them to be reported separately and, therefore, they are not shown separately in these comparisons.

Plans and expectations

The proportion of all high school seniors in minority groups who planned to continue their education at 4-year colleges and institutions directly after high school increased between 1972 and 1992, although between-group differences have remained fairly constant.

Although many students decide whether or not to attend college early in their high school careers, students' plans as high school seniors are likely to reflect their previous academic performance, their financial means, and their educational and career goals. In both 1972 and 1992, similar proportions of black and white seniors planned to attend 4-year colleges and institutions. Hispanic seniors were less likely than white seniors to plan to attend a 4-year college in both 1972 and 1992, although the proportion of Hispanic seniors who planned to attend college increased by 9 percentage points

over this time period. In 1992, Asian/Pacific Islander seniors were more likely than white seniors to plan to attend a 4-year college immediately after high school graduation.

A larger proportion of black and Hispanic seniors planned to attend an academic program in a 2-year college in 1992 than in 1972: the proportion of black seniors increased from 5 percent to 11 percent, while the proportion of Hispanic seniors increased from 11 to 26 percent. However, no change occurred among white seniors over this time period. In 1992, Hispanic seniors were more likely than their white peers to plan to attend a 2-year academic program.

Percentage of high school seniors who planned to continue their education the next year at 4-year colleges or in 2-year academic programs

Race/ethnicity	4-year program		2-year academic program	
	1972	1992	1972	1992

White	35	55	12	12
Black	32	52	5	11
Hispanic	11	20	11	26
Asian/Pacific Islander	47	65	18	12

SOURCE: National Longitudinal Study of 1972 and National Education Longitudinal Study of 1988, Second Follow-up.

Students consider many factors when selecting a college, including financial considerations, such as the cost of attendance and the availability of financial aid. The percentage of black, white, and Hispanic seniors who reported that tuition and expenses were very important considerations in selecting a college declined between 1972 and 1992. On the other hand, the proportions of Asian/Pacific Islander seniors who reported that tuition and fees were important factors did not differ significantly between the two time periods. Availability of financial aid, however, remained very important over this time period for black and Hispanic seniors. In 1992, black and Hispanic seniors were more likely to say that financial aid was a very important consideration in selecting a college (67 and 62 percent, respectively) than white seniors (40 percent).¹

- ♦ *The proportion of high school students in all racial and ethnic groups expecting to complete only high school or less fell dramatically between 1972 and 1992, while the proportion expecting to graduate from college increased.*

Students' long-term expectations for education may differ substantially from their short-term plans. While not all high school seniors plan to attend college immediately after graduation, nearly all students expect to continue their education eventually. The proportion of seniors expecting to at least finish college ranged from 62 percent for Hispanics to 78 percent for Asian/Pacific Islanders in 1992. Since 1992, the proportions of white, black, and Hispanic seniors who expected to complete college increased by 20 percentage points, compared to an increase of 9 percentage points for Asian/Pacific Islander seniors.² Even though educational plans and expectations are generally high among white, black, Hispanic, and Asian/Pacific Islander high school seniors, wanting to go to college is only the first step in making the transition. Preparing to

Percentage of 1992 high school seniors expecting to complete various levels of education

SOURCE: National Education Longitudinal Study of 1988, Second Follow-up.

go to college is the second step.

Preparation and course-taking patterns

Success in higher education depends on good preparation in high school. Evidence from the Postsecondary Education Transcripts supports this statement. Of the students in the high school class of 1982 who participated significantly in higher education (as defined above), the percentage who completed a bachelor's degree was strongly related to the number of remedial courses the person took at postsecondary institutions. Among those who took no remedial courses, 57 percent completed a bachelor's degree. Among those who took 3 or more,

Bachelor's degree completion among participants in higher education for the high school class of 1982, by number of remedial courses taken: 1993

Number of remedial courses taken	Percent completing bachelor's degree
Total	46.1
None	57.4
1	48.7
2	37.2
3-4	26.2
More than 4	24.8

NOTE: Participants are defined as those who completed more than 10 credits. Remedial courses include remedial writing, remedial reading, remedial speech, development grammar, ESL, all pre-collegiate mathematics, and basic academic and developmental study skills.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Postsecondary Education Transcript Studies of the High School and Beyond Study (HS&B) Sophomore Cohort, 1993.

roughly 25 percent completed their degree.

- ♦ *Students from all minority groups are taking a more rigorous curriculum, although black, Hispanic, and American Indian/Alaskan Native students continue to trail their Asian/Pacific Islander and white counterparts in advanced mathematics and science course taking.*

Examining the transcripts of high school graduates shows if the academic rigor of the courses they take has changed over time. The average number of academic course units earned by public high school graduates increased between 1982 and 1992 for all racial and ethnic groups. In 1992, Asian/Pacific Islander graduates earned the most academic credits (18.5), while American Indian/Alaskan Native graduates earned the least (16.0); this range is equivalent to five semester courses. White graduates earned 17.6 credits, compared to Hispanic and black graduates who earned 16.9 and 16.7 credits, respectively (Indicator 23, *Condition 1994*).

This renewed emphasis on academic course taking also is reflected by the increase in the percentage of high school graduates taking the "New Basics" curriculum, a core curriculum composed of 4 units of English; 3 units each of science, social studies, and mathematics, recommended in *A Nation at Risk*.³ The proportion of 1994 high school graduates who took this core curriculum ranged from about 44 percent for blacks, Hispanics, and American Indians/Alaskan Natives to about 54 percent for whites and 57 percent for Asians/Pacific Islanders. This represents a substantial increase from 1982, when only 14 percent of graduates took this stringent of a curriculum (Indicator 28, *Condition 1996*).

Percentage of high school graduates taking the "New Basics" curriculum

Race/ethnicity	1982	1994
Total	14	51
White	16	54
Black	12	45
Hispanic	7	44
Asian/Pacific Islander	21	57
American Indian/ Alaskan Native	7	44

SOURCE: Indicator 28, *Condition 1996*.

Students in all racial and ethnic groups are taking more advanced mathematics and science courses, although black, Hispanic, and American Indian/Alaskan Native graduates still trail their Asian/Pacific Islander and white counterparts in advanced mathematics and science course taking (table 29-2, *Condition 1996*). From a course-taking perspective at least, it appears that all racial and ethnic groups are better prepared for college today than they were in the early 1980s.

- ◆ *The reading skills of white seniors are better than those of their minority counterparts. Although the gap in white-black and white-Hispanic scores has narrowed somewhat, large differences still remain.*

Course taking is only one component of preparing for college; the skills that students gain from those classes is another important measure of their readiness to enter college. For example, a student's ability to comprehend and effectively use written language is a necessary skill to master prior to taking on a more advanced college curriculum. There is substantial variation in average reading proficiency among seniors from

different racial and ethnic groups. In 1994, for instance, the reading proficiency of white seniors was higher than Asian/Pacific Islander seniors, who, in turn, scored higher than their black and Hispanic counterparts. However, the reading proficiency scores of American Indian/Alaskan Native seniors were not statistically distinguishable from their Asian/Pacific Islander and Hispanic peers.

Average reading proficiency of seniors: 1994

SOURCE: National Assessment of Educational Progress, 1994 Reading Assessment.

Reading proficiency scores for white, black, and Hispanic 17-year-olds are available for several years between 1975 and 1992. Although the reading gap between whites and their black and Hispanic counterparts remains wide, this gap has narrowed over time (Indicator 13, *Condition 1995*). In fact, the reading skills of white, black, and Hispanic 17-year-olds have all increased since the mid-1970s with the scores of black and Hispanic students increasing more than those of their white peers (Indicator 13, *Condition 1995*). There is some evidence, however, that the white-minority gap in reading is no longer narrowing.⁴

- ◆ *Among high school seniors, both Asian/Pacific Islanders and whites have higher mathematics proficiency than Hispanics, American Indians/Alaskan Natives, and blacks. Over the past 20 years, however, scores for whites have increased at a slower rate than those for blacks and Hispanics, thereby causing this gap to narrow.*

Proficiency in mathematics allows students to use higher level thinking skills to solve complex problems. If students do not have a firm grasp of mathematics upon leaving high school, they will be at a disadvantage when trying to master that material in college. Among the senior class of

1992, both Asian/Pacific Islanders and whites had higher mathematics proficiency scores than their Hispanic, American Indian/Alaskan Native, and black peers.⁵

Average mathematics proficiency of seniors: 1994

SOURCE: National Assessment of Educational Progress, 1994 Mathematics Assessment.

For the years 1973–92, mathematics trend data are available for white, black, and Hispanic 17-year-olds. These data suggest that although a large gap in mathematics proficiency exists at age 17 between whites and their black and Hispanic peers, the gap is narrowing (Indicator 16, *Condition 1996*). Among white 17-year-olds, the mathematics proficiency declined between 1973 and 1982, but has rebounded since. On the other hand, the mathematics scores of black and Hispanic 17-year-olds were level from 1973 to 1982, but have increased sizably between 1982 and 1992—narrowing the gap between the scores of blacks and Hispanics and their white counterparts.

- ◆ *With the exception of Asian/Pacific Islanders, large gaps in science proficiency exist between whites and other racial/ethnic groups. Science scores for most groups have increased since the early 1980s.*

The ability to apply scientific information, interpret data, and make inferences about scientific findings is a prerequisite for entry into most scientific fields. Adequate preparation in science in high school can influence success in college-level biology, chemistry, and physics—courses that often serve as gatekeepers for many scientific fields, including medicine and engineering. For the senior class of 1990, science proficiency scores are available for all

racial/ethnic groups. Scores for white and Asian/Pacific Islander seniors were higher than those for black and Hispanic seniors. However, the average science proficiency of American Indian/Alaskan Native seniors was lower than that of white students, higher than the average science proficiency of black students, and not significantly different from the average science proficiency of Asian/Pacific Islander and Hispanic students.⁶

Trend data on science proficiency are available for whites and blacks starting in 1970 and for Hispanics starting in 1977. These data demonstrate that between 1970 and 1982, the science proficiency of white and black 17-year-olds declined, but scores for both groups have

Average science proficiency of seniors: 1990

SOURCE: National Assessment of Educational Progress, 1994 Science Assessment.

risen since then. In 1992, the science proficiency of white 17-year-olds was still below their 1970 level, while black scores had fully regained ground. Moreover, between 1977 and 1982, scores for Hispanics declined, but have rebounded since (Indicator 16, *Condition 1996*).

- ◆ *Average SAT scores for minority test-takers have improved over the past 20 years, especially for college-bound blacks and American Indians/Alaskan Natives.*

The Scholastic Assessment Test (SAT) is designed to predict success in the freshman year of college. SAT scores are not just measures of the skills of those who could potentially go to college, but also of the skills of those who actually plan to go. Since 1976, the mean scores of black test-takers have risen 24 points on the verbal section and 34 points on the mathematics section, while the

mean scores of whites have fallen 3 points on the verbal section and have risen 5 points on the mathematics section. American Indians/Alaskan Natives also had relatively large increases in SAT scores over this time period: 15 points on the verbal section and 27 points on the mathematics section (table 22-2, *Condition 1996*).

College enrollment rates

- ◆ *Blacks and Hispanics are less likely than whites to make an immediate transition from high school to college.*

Since most college students enroll in college immediately after completing high school, the percentage of high school graduates enrolled in college the October following graduation is an indicator of the total proportion who will ever enroll in college. College enrollment rates reflect both the accessibility of higher education to high school graduates, as well as their assessment of the relative value of attending college compared to working, entering the military, or other possible pursuits. Enrollment rates for white

Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation: October 1972–94

SOURCE: Indicator 7, *Condition 1996*.

high school graduates increased from 50 percent in the early 1970s to about 60 percent in the mid-1980s and have fluctuated between 60 and 65 percent since then. After a period of decline in the late 1970s and early 1980s, the percentage of blacks enrolling in college immediately after high school graduation rose again until the late 1980s, when it appeared to have leveled off at around 50 percent. Between 1972 and 1994, Hispanic enrollment rates have mostly fluctuated between 45 and 55 percent (Indicator 7, *Condition 1996*).

The type of institutions that high school graduates first attend can affect their likelihood of completing a bachelor's degree. Students who begin their higher education at a 2-year college are far less likely to earn a bachelor's degree than their counterparts who begin at a 4-year college (Indicators 10 and 26, *Condition 1996*). In 1994, white graduates were twice as likely to enroll in a 4-year college as a 2-year college after high school, while black graduates were about 1.5 times as likely and Hispanic graduates were equally likely to enroll in a 4-year college (table 7-2, *Condition 1996*).

- ◆ *Although the proportion of 1980 high school sophomores who made the immediate transition to college after high school varied by race/ethnicity, the proportion who delayed entry into college did not differ measurably by race/ethnicity.*

Although most college students first enrolled in college in the fall following their high school graduation, a sizable number delayed entry to college. Research has shown that delayed entry is negatively associated with earning a bachelor's degree (Indicators 10 and 26, *Condition 1996*). Although the proportion of 1980 high school sophomores who started college in the fall of 1982 varied by race/ethnicity, the proportion who delayed was similar for whites, blacks, Hispanics, and Asian/Pacific Islanders—about 14 percent each. A larger proportion of American Indians/Alaskan Natives (25 percent) were more likely to delay entry into college (table 26-1, *Condition 1996*).

- ◆ *Higher education enrollment rates of high school graduates aged 18–24 have risen substantially for whites and moderately for blacks, although whites are still more likely to enroll than blacks or Hispanics. Enrollment rates among older adults are similar for whites, blacks, and Hispanics.*

Racial and ethnic differences in the college enrollment rates may reflect variations in access to and persistence in higher education. Between 1972 and 1994, white high school graduates aged 18–24 were more likely to be enrolled in college than were their black and Hispanic counterparts.

Percentage of 18- to 24-year-old high school graduates enrolled in college: October 1972–94

SOURCE: Indicator 7, *Condition 1996*.

Between 1992 and 1994, the average enrollment rate for whites was 9 percentage points higher than that of blacks and 8 percentage points higher than that of Hispanics. White enrollment rates for this age group have grown substantially since 1981, while enrollment growth for blacks and Hispanics grew moderately over this period (Indicator 8, *Condition 1996*).

Enrollment rates for older adults (high school graduates aged 25 or older) generally were much lower than those for their younger counterparts aged 18–24 regardless of racial/ethnic group. Between 1992 and 1994, the average college enrollment rates were similar for white, black, and Hispanic high school graduates aged 25–34 (Indicator 8, *Condition 1996*).

- ♦ *Hispanic college students are more likely to be enrolled part-time than their white or black peers.*

Students who initially enroll part-time in college are less likely to persist toward a bachelor's degree than those who enroll full time (Indicators 10 and 26, *Condition 1996*). Hispanic high school graduates aged 18–24 were far more likely to be enrolled in college part time, as opposed to full time, than were their white or black counterparts in 1994 (table 8-2, *Condition 1996*).

College persistence and completion

- ♦ *Among bachelor's degree seekers, whites and Asian/Pacific Islanders are more likely to persist toward a bachelor's degree than are their black and Hispanic counterparts.*

Half of all students beginning postsecondary education at 2- or 4-year colleges indicate that their initial degree goal is a bachelor's degree. Among beginning students seeking bachelor's degrees in 1989–90, 63 percent had either completed or were still working toward a bachelor's degree in spring 1994. An additional 8 percent had earned an associate's degree or a vocational certificate (Indicator 10, *Condition 1996*). Whites and Asians were more likely than blacks or Hispanics to have either earned a bachelor's degree or still to be working toward a bachelor's degree in spring 1994 (table 10-1, *Condition 1996*).

The proportion of bachelor's degree seekers who were no longer enrolled in spring 1994 but had earned associate's degrees or vocational certificates were similar for whites, blacks, Hispanics, and Asian/Pacific Islanders, although the latter were less likely to earn vocational certificates. Of 1989–90 bachelor's degree seekers who had not earned a degree and were no longer enrolled in spring 1994, blacks were more likely to have been enrolled for 18 months or less (57 percent) than were their white, Hispanic, or Asian/Pacific Islander counterparts (36, 40, and 37 percent, respectively).

- ♦ *Of those who began their postsecondary education at a community college in 1989–90, whites and blacks were less likely than Hispanics to have either earned a degree or certificate or still to be enrolled for one by spring 1994.*

About 44 percent of undergraduates attend public 2-year colleges. These institutions serve many purposes: they provide vocational training and skill development; they offer an inexpensive way to complete lower division requirements before entering a 4-year institution; and they meet purely avocational interests. Among students who began their postsecondary education at a community college in 1989–90, less than one-quarter had completed an associate's degree or vocational certificate there by spring 1994, although 37 percent had completed an award at some institution. Those who did not complete an

Proportion of 1989–90 first-time bachelor's degree seekers who had attained or were still enrolled toward a bachelor's degree in spring 1994

SOURCE: Table 10-1, *Condition 1996*.

award at this community college spent a substantial amount of time there, however, averaging 14 months of enrollment (Indicator 9, *Condition 1996*).

White community college students were more likely to earn an associate's degree at their first institution by spring 1994 than their black counterparts (18 and 9 percent, respectively) (table 9-1, *Condition 1996*). Hispanics completed associate's degrees at their first institution at a rate similar to whites, but were less likely to earn vocational certificates there. Both blacks and whites, however, were more likely to have neither earned an award nor still be enrolled for one by spring 1994 (55 and 50 percent, respectively) than were Hispanics (40 percent).

Four out of 10 first-time, beginning community college students transfer to another institution—half to a 4-year college or university and half to a less than 4-year institution. Transfer rates for whites and blacks were similar, both around 39 percent. Differences between white and Hispanic transfer rates were not statistically significant. Hispanics were more likely than whites, however, to transfer to a less-than-4-year institution as opposed to a 4-year institution (table 9-2, *Condition 1996*). In spring 1994, about 1 in 10 white, black, and Hispanic students who had started in a community college in 1989–90 had either earned a bachelor's degree or were enrolled in a 4-year college or institution (table 9-1, *Condition 1996*).

Proportion of 1989–90 first-time community college students who transferred to another institution by spring 1994, by destination of first transfer

SOURCE: Table 9-2, *Condition 1996*

- ◆ Compared to 1981 levels, the number of bachelor's degrees earned in 1993 was up for males and females in all racial/ethnic groups. The increase was greater for females than males in each racial/ethnic group.

The ability of colleges and universities to attract and graduate minority students is important to the goal of equal opportunity. Changes in the number of degrees earned by minorities of both sexes, particularly in relation to the number earned by whites, provides a measure of higher education's progress toward this goal. Compared to 1981 levels, the number of bachelor's degrees earned in 1993 was up for males and females in all racial/ethnic groups, with the largest increases occurring for Asian/Pacific Islander and Hispanic males and females (two groups with large immigration rates). Between 1981 and 1993, Hispanic, Asian/Pacific Islander, and American Indian/Alaskan Native males and females showed higher percentage gains in the number of bachelor's degrees earned than did whites of the same sex.⁷

- ♦ *Black and American Indian/Alaskan Native college graduates were less likely than their white and Asian/Pacific Islander peers to have completed their bachelor's degree program in 4 years or less.*

Number of bachelor's degrees conferred (in thousands)

Race/ ethnicity	Male			Female		
	1981	1993	Percent change	1981	1993	Percent change
White	406.2	435.1	7.1	401.1	512.2	27.7
Black	24.5	28.8	17.6	36.2	50.0	38.1
Hispanic	10.8	19.9	84.3	11.0	25.5	131.8
Asian/Pacific Islander	10.1	25.3	150.5	8.7	26.2	201.1
American Indian/ Alaskan/Native	1.7	2.4	41.2	1.9	3.2	68.4

SOURCE: Integrated Postsecondary Education Data System (IPEDS).

The traditional time to complete most bachelor's degree programs is 4 years. But, a number of circumstances such as changing schools or majors, stopping out for periods of time, attending on a part-time bases, or having difficulty enrolling in required classes may delay graduation. Taking longer to complete college not only causes students to incur additional

Percentage of college graduates completing the bachelor's degree within various years of starting college: 1993

	4 years or less	More than 4 up to 5 years	More than 5 up to 6 years	More than 6 years
Total	36	29	11	24
White	36	29	11	24
Black	27	29	14	30
Hispanic	30	36	12	29
Asian/Pacific Islander	38	36	14	13
American Indian/ Alaskan Native	25	27	7	42

SOURCE: Table 11-2, *Condition 1996*.

tuition costs, but also delays them in starting their careers. Blacks and American Indian/Alaskan Native students are less likely than their white and Asian/Pacific Islander counterparts to complete college in 4 years or less. Among 1993 bachelor's degree recipients, 4 out of 10 American Indian/Alaskan Native graduates took longer

than 6 years to complete college, while only 1 out of 10 Asian/Pacific Islander graduates took that long to complete college (Indicator 11 and table 11-1, *Condition 1996*).

- ♦ *Educational attainment rates for white, black, and Hispanic young adults have risen since the early 1970s, although young adult whites are still far more likely to have completed college than their black and Hispanic counterparts.*

Differences in college enrollment and persistence rates across racial/ethnic groups are reflected in

Percentage of 25- to 29-year-olds who earned a bachelor's degree: March 1971–95

SOURCE: Indicator 25, *Condition 1996*.

educational attainment figures for young adults. The proportion of white, black, and Hispanic 25- to 29-year-olds with either some college or more or a bachelor's degree or more rose between 1971 and 1995 (Indicator 25, *Condition 1996*). Whites in this age group were still almost twice as likely as their black and Hispanic counterparts to have earned a bachelor's degree in 1995.

- ♦ *Asian/Pacific Islander college graduates were more likely than whites to have majored in engineering and computer science (a relatively high paying field). Black, Hispanic, and Asian/Pacific Islander graduates were less likely to major in education (a relatively low paying field).*

Career opportunities available to college students are affected by the fields they choose to study. For college graduates, both starting salary (Indicator 35, *Condition 1996*) and the degree to which job opportunities have career potential (Indicator 31, *Condition 1996*) are related to college major. In 1993, Asian/Pacific Islanders were far more likely than whites to major in biological/life sciences, computer and information sciences, or

engineering, but were far less likely to major in education. Black bachelor's degree recipients were more likely than their white counterparts to major in business management, but were less likely to major in education. Hispanic bachelor's degree recipients were more likely than whites to major in the social sciences or history, but were less likely to major in education. American Indian/Alaskan Native bachelor's degree recipients were more likely than whites to major in the humanities or social sciences and history, but were less likely to major in business management.⁸

College access, participation, and completion: an alternative approach

An alternative approach to examining the experiences of minorities in postsecondary education is to look back at the experiences of two high school graduating classes at the point each reached age 30. The Postsecondary Education Transcript Studies (PETS) were conducted in 1984 for the high school class of 1972 and in 1993 for the high school class of 1982. Transcripts were requested from each member of the two graduating classes who reported attending a postsecondary institution. The transcripts provide information on courses taken, credits earned, and degrees completed and provides a rich source of information about the experiences of these two groups in postsecondary education. The information in the table below was compiled on the basis of these two studies.

First, consider the proportion of each class for whom transcripts were received. This statistic can be interpreted as the proportion of the class who had access to postsecondary education. The percentage increased from 60 for the class of 1972 to 70 percent for the class of 1982. Note that this

Percentage distribution of bachelor's degrees conferred, by field of study: 1993

Field of study	American Indian/Alaskan Native					
	All	White	Black	Hispanic	Islander	Native
All fields	100.0	100.0	100.0	100.0	100.0	100.0
Biological/life sciences	4.1	3.8	3.6	4.1	10.1	3.8
Business management	22.1	21.6	24.6	21.1	22.9	18.5
Computer and information sciences	2.1	1.7	2.9	1.9	4.5	1.5
Education	9.3	10.2	7.2	6.6	2.1	11.4
Engineering	5.3	4.8	3.4	5.1	12.7	3.2
English language and literature	4.8	5.2	3.9	3.9	3.1	4.1
Health sciences	5.8	6.0	6.1	4.4	4.9	6.1
Humanities	2.9	2.8	3.5	4.2	2.0	4.5
Mathematics	1.3	1.3	1.3	1.0	1.8	1.0
Physical sciences	1.5	1.5	1.1	1.0	2.2	1.6

1982	44	47	35	26	66
Change	+8	+9	+5	+2	+12
Percentage with a baccalaureate or higher degree					
1972	24	26	14	11	43
1982	29	32	15	13	52
Change	+4	+6	0	+2	+9
Percentage with a bachelor's degree or higher degree among those who attended a 4-year institution and completed more than 10 credits.					
1972	66	68	49	44	81
1982	65	68	42	49	79
Change	-1	0	-7	+5	-2

NOTE: Transcripts were collected at approximately age 30 for each high school graduating class. American Indians and others are included in the total but are not shown separately.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Postsecondary Education Transcript Studies of the National Longitudinal Study of the High School Class of 1972 and the High School and Beyond Study (HS&B) Sophomore Cohort, 1984 and 1993.

Second, consider the proportion of each class who completed more than 10 postsecondary credits. This statistic can be interpreted as the proportion who participated significantly in higher education. It corresponds roughly to those who completed the equivalent of at least one full-time semester. This percentage also increased between the two classes from 51 percent to 62 percent. Note that between 12 and 15 percent of those who attend a higher education institution do not complete more than 10 credits. Again, the increase is evident for whites, blacks, Hispanics, and Asians.

Third, consider the proportion of each class who completed more than 10 credits and attended a 4-year institution. This statistic can be interpreted as the proportion who have an opportunity to earn a bachelor's degree. This percentage is substantially lower than the percentage with significant participation as defined above—44 versus 62 percent in the class of 1982, for example. However, the percentage did increase between the two classes from 37 to 44 percent. While this increase was confined principally to

whites and Asians, it should be noted that, in both generations, Hispanics attended community colleges at a higher rate than other groups.

Fourth, consider the proportion of each high school graduating class that completed a bachelor's degree or higher. Though associate's degrees are important credentials for many individuals, a bachelor's degree is associated with significant long-term economic advantages. This percentage increased moderately between the two classes from 24 to 29 percent. The increase was confined to whites. (Although it appears there was an increase for Asians as well, the small samples of Asians in the studies preclude a definitive conclusion).

Finally, among those who attended a 4-year institution and completed more than 10 credits, consider those who completed a bachelor's degree or higher degree. This is the proportion who had the opportunity to earn a bachelor's degree. Overall, there was no change in this proportion between the two generations: 66 percent for the class of 1972 and 65 percent for the class of 1982. Among racial/ethnic groups, however, there is evidence of a decline for blacks—from 49 to 42 percent. (Although it appears there was an increase in degree completions rates for Hispanics, the small sample sizes of Hispanics in the studies preclude a definitive conclusion).

Summary

As the gap in earnings between high school and college graduates continues to widen, access to a college education is becoming even more important for minorities wanting to share in the American dream. Almost all high school seniors expect to complete at least some college, although Hispanic seniors are less likely than their white,

black, and Asian/Pacific Islander counterparts to plan to attend college right after high school. High school graduates from all racial and ethnic groups are taking a more rigorous high school curriculum, and mathematics and science test scores are generally up—although blacks, Hispanics, and American Indians/Alaskan Natives continue to trail their white and Asian/Pacific Islander counterparts in critical skill areas.

However, black and Hispanic high school graduates are less likely than their white peers to make the immediate transition to college and Hispanics are more likely to enroll in a 2-year college or as part-time students—two conditions that make it less likely they will persist toward a bachelor's degree. Among bachelor's degree seekers, whites and Asian/Pacific Islanders are more likely to persist towards a bachelor's degree than their black and Hispanic counterparts. Of those who earn a bachelor's degree, black and American Indian/Alaskan Native graduates are less likely than their white and Asian/Pacific Islander peers to finish in 4 years or less—a condition that delays their entrance into the full-time labor market.

Several minority groups do tend to major in fields that will help them recoup their college costs. Black, Hispanic, and Asian/Pacific Islander graduates were less likely than whites to major in education. Asian/Pacific Islander graduates were more likely than white graduates to major in computer science and engineering.

Teachers' working conditions

by Susan P. Choy, MPR Associates, Inc.

To deliver high quality education, schools must attract, develop, and retain effective teachers. Working conditions play an important role in a school's ability to do so. Schools that are able to offer their teachers a safe, pleasant, and supportive working environment and adequate compensation are better able to attract and retain good teachers and motivate them to do their best. Teachers' working conditions are important to students as well as teachers because they affect how much individual attention teachers can give to students. Large class sizes or disruptive students, for example, can make both teaching and learning difficult.

Some aspects of teachers' working conditions go along with the job regardless of where a teacher works. For example, teacher salaries tend to be low relative to those earned by similarly qualified individuals in other professions regardless of the type or location of the school. Other aspects of teachers' working conditions, such as school safety, vary widely from school to school. Thus, in addition to being concerned about teachers' working conditions in general, we need to pay attention to the types of schools that tend to have desirable or difficult working conditions and, for equity reasons, to the characteristics of the students who attend them.

Data presented here describe a number of aspects of teachers' working conditions, including workload, compensation, school and district support for teachers' professional development, school decision making, school safety, student readiness to learn, and public respect for teachers.

Workload

Teaching workload has several dimensions, including the amount of time spent working, the number of classes taught, and the number of students in each class. The amount of time a teacher devotes to his or her job is partly self-determined, reflecting not only what the school requires or expects but also the teacher's efficiency, enthusiasm, and commitment.

- ◆ *The average amount of time a full-time teacher is required to spend at school is only about three-quarters of the teacher's work week.*

In school year 1993–94, full-time public school teachers were required to be at school for an average of 33 hours per week to conduct classes, prepare lessons, attend staff meetings, and fulfill a variety of other school-related responsibilities. The average was similar whether they worked at the elementary or secondary level (Indicator 48, *Condition 1996*).

In addition to the required time at school, a full-time public school teacher worked an average of 12 additional hours per week before and after school and on weekends. Teachers spent 3 of these hours in activities involving students and 9 hours in other school-related work, such as grading papers, preparing lessons, and meeting with parents.

Full-time public school teachers in rural/small town communities spent more time, on average,

Average hours full-time teachers worked per week before and after school and on weekends: School year 1993–94

School characteristics	Total school-related	With students	Other school-related
Public	12.1	3.3	8.7
School level			
Elementary	11.0	1.7	9.2
Secondary	13.2	5.0	8.2
Urbanicity			
Central city	11.6	3.0	8.6
Urban fringe/ large town	12.4	3.1	9.4
Rural/ small town	12.1	3.7	8.4
Percent low income students			
0–5	13.3	3.8	9.5
6–20	12.9	3.7	9.2
21–40	12.1	3.5	8.7
41–100	11.0	2.7	8.3
Private	12.9	3.6	9.3

SOURCE: Indicator 48 and table 48-1, *Condition 1996*.

than those in other community types in activities involving students (table 48-1, *Condition 1996*). And, those in schools with relatively few low

income students (5 percent or fewer students eligible for free or reduced-priced lunches) spent more time in activities involving students and also more time on other school-related activities than did those in schools with more than 40 percent low income students.

On average, full-time private school teachers were required to be at school about an hour longer per week and spent about an hour more outside of school than their public school counterparts.

In 1992, the average amount of time per year public school teachers at the primary level spent teaching (excluding other school responsibilities) in 15 countries (mostly European) ranged from a low of 624 hours in Sweden to a high of 1,093 hours in the United States, averaging 858 hours.¹

- ♦ *Public school teachers tend to have larger classes than private school teachers.*

In school year 1993–94, public school teachers had an average class size of 23.2 and taught an average of 5.6 classes per day (excluding those in self-contained classrooms). The corresponding averages for private school teachers were 19.6 and 6.0, respectively (Indicator 48, *Condition 1996*).

Public school teachers in rural/small town areas had lower average class sizes than teachers in

Average class size and average number of classes per day for full-time teachers: School year 1993–94

School characteristics	Class size	Classes per day*
Public	23.2	5.6
Urbanicity		
Central city	24.1	5.5
Urban fringe/ large town	24.1	5.5
Rural/ small town	22.0	5.7
School size		
Less than 150	15.4	6.2
750 or more	24.5	5.4
Private	19.6	6.0

* Since elementary teachers do not tend to teach separate classes, only 8 percent of the teachers who responded to this question were elementary teachers, while 92 percent were secondary teachers.

SOURCE: Indicator 48 and table 48-1, *Condition 1996*.

other community types, and those in the smallest

schools (those with less than 150 students) had lower average class sizes than those in the largest schools (those with 750 students or more) (table 48-1, *Condition 1996*).

- ♦ *Pupil-teacher ratios at the secondary level in the United States are high compared to those in other countries.*

Among 16 countries (primarily European, but also including Japan, Australia, and New Zealand), the ratio of students to teachers (full-time-equivalents) at the secondary level averaged 13.8 in public education. In the United States, the ratio averaged 16.7.²

Compensation

How much districts and schools pay their teachers and what criteria they use as a basis for salary increases are important aspects of teachers' working conditions. In recent years, many states and districts have been experimenting with new career paths and salary structures in an effort to attract and retain high quality teachers.

Salary schedules

- ♦ *In school year 1993–94, public school district salaries for teachers with a bachelor's degree but no experience averaged \$21,900 (in current dollars).*

Scheduled salaries for teachers usually increase with education and experience. In school year 1993–94, public school districts paid an average of \$40,500 at the top of their schedules (table 55-6, *Condition 1996*). Among private schools with salary schedules (about two-thirds of all private schools), salaries were considerably less, starting at \$16,200 and rising to \$27,300. Regional differences in salary schedules were prominent, with public school districts in the Northeast paying the highest salaries, on average, and districts in the South generally paying the lowest

Average scheduled salaries (in 1995 constant dollars) in public school districts: School year 1993–94

■ Bachelor's degree, no experience ■ Highest step

SOURCE: Table 55-6, *Condition 1996*.

salaries.

The smallest school districts (those with less than 1,000 students) tended to pay less, especially at the higher steps of the salary schedule. Their average salary rate at the highest step on the schedule was \$36,500, compared to \$43,800 in the next largest district size category (1,000 to 4,999 students) and even more in larger districts.

Adjusting for inflation, scheduled salary rates for teachers with a bachelor's degree but no experience declined by an average of about 4 percent in public school districts between 1987–88 and 1993–94, and rose by an average of about 2 percent in private schools.³

Average salaries

- ♦ *Adjusted for inflation, average salaries for public school teachers increased substantially between 1981 and 1995.*

Following a period of decline in the 1970s, public school teachers' salaries increased throughout the 1980s and into the early 1990s, reaching a peak in 1991 (Indicator 55, *Condition 1996*). In 1995, the average salary for public school teachers was \$37,400, up 20 percent from \$31,100 (in 1995 constant dollars) in 1981. At least some of this increase can be explained by the aging of the teacher work force. For example, between 1981 and 1991, the median number of years of teaching experience increased from 12 to 15 years. Adjusting for inflation, the average salary for beginning public school teachers increased 24 percent from 1980 to 1995 (table 55-1, *Condition 1996*).

- ♦ *Teachers earn less than many other college graduates with similar literacy skills; however, adjusting for inflation, education majors have fared better than other recent college graduates in terms of growth in earnings.*

In 1992, teachers had literacy skills similar to those of many other college graduates, including private-sector executives and managers, engineers, physicians, writers and artists, social workers, sales representatives, education administrators, and registered nurses. However, they often earned less. The average annual earnings for teachers (prekindergarten through secondary, public and private) employed full time were \$26,000 in 1991, compared to \$38,500 for all persons with a bachelor's degree who were employed full time (Indicator 58, *Condition 1996*).

Among recent college graduates who majored in education and who were working full time 1 year after earning their bachelor's degree and were not enrolled in school, the median salary (in 1995 constant dollars) increased by 5 percent between 1980 and 1993. In comparison, the increase for all recent college graduates was 1 percent (table 35-1, *Condition 1996*).

- ♦ *By some salary measures, teachers in the United States are better off than teachers in other countries.*

Comparing teacher salaries meaningfully across countries requires adjusting for differences in standards of living. One way to do this is to convert salaries to purchasing power parity (PPP) rates. Using this approach, the starting and maximum salaries for public school teachers at the primary level in the United States were higher than those in most European countries in 1992.⁴

Another way to assess the status of the teaching profession in a country is to compute the ratio of teacher salaries to the per capita Gross Domestic Product (GDP), an index of the economic well being of a country's population. Using this measure, starting salaries for public school teachers at the primary level in 25 countries (mostly European) were generally similar to or slightly above the country's per capita GDP (the average was 1.2); they were lowest in Sweden (0.8) and the United States (0.9).

Support for teachers' professional development

To provide high quality education, schools not only must hire well qualified teachers, but also must help them improve their skills, stay current in their fields, and learn about new teaching methods. District and school support for professional development is likely to contribute to higher teacher morale and lower attrition.

◆ *Most schools and districts provide support for teachers to develop professionally.*

In school year 1993–94, the vast majority of full-time public school teachers participated in school- and district-sponsored workshops or in-service training, regardless of school level or community type. However, participation was a little higher at the elementary level than at the secondary level for public school teachers (table 59-2, *Condition 1996*).

Full-time public school teachers were most commonly supported in their professional

Percentage of full-time teachers who participated in district- and school-sponsored workshops or in-service training: School year 1993–94

School characteristics	Elementary		Secondary	
	Sponsored by:		Sponsored by:	
	District*	School	District*	School
Public	89.6	83.7	84.9	79.1
Central city	87.7	86.4	82.8	81.5
Urban fringe/				
large town	91.0	83.2	84.7	78.7
Rural/				
small town	89.9	82.1	86.3	78.0
Private	78.9	78.0	68.9	78.4

* For-private schools refers to organizations with which the school was affiliated rather than districts.

SOURCE: Table 59-2, *Condition 1996*.

development through released time from teaching or scheduled time for professional development activities. Other types of support included professional growth credits and reimbursement of tuition, fees, or expenses. Private school teachers were less likely to receive professional growth credits and released time and scheduled time from teaching than were public school teachers, but they were more likely to

receive tuition and/or fees than were their public school counterparts (Indicator 59, *Condition 1996*).

School decision making

The extent to which teachers participate in

SOURCE: Indicator 59, *Condition 1996*.

decisions about school policies and issues and the autonomy that teachers have in the classroom have an important effect on school climate, a critical aspect of teachers' working conditions.

◆ *Teachers' perceptions of their influence over important policies in their schools vary by control of school.*

About one-third of all public school teachers thought that teachers in their school had a good deal of influence over important policies such as setting discipline policy, establishing curriculum, and determining the content of in-service programs. In each of these areas, the proportions were higher for teachers in private schools (Indicator 47, *Condition 1996*).

At both the elementary and secondary levels, teachers in public schools with relatively few low

SOURCE: Indicator 47, *Condition 1996*.

income students (5 percent or fewer students

eligible for free or reduced-price lunches) were generally more likely than teachers in schools with relatively large proportions of low income students (more than 40 percent of students eligible for free or reduced-price lunches) to report that teachers had a good deal of influence over their school's policies (tables 47-1 and 47-3, *Condition 1996*).

Teachers' perception of their influence over school policy appears to be related to school size as well. In school year 1993–94, teachers in the smallest public schools (those with less than 150 students) were more likely than teachers in the largest schools to think that teachers had a good deal of influence in these areas (tables 47-1, 2, and 3, *Condition 1996*).

◆ *Teachers perceive that they have more control over*

Percentage of public school teachers who thought teachers had a good deal of influence over their school's policies: School year 1993–94

School characteristics	Discipline policy	In-service content	Establishing curriculum
Elementary	41.8	32.6	32.2
Low poverty rate			
5 percent or less	47.0	37.2	37.0
More than 40 percent	38.4	30.3	27.8
School size			
Less than 150	52.9	35.3	46.5
750 or more	34.4	32.3	27.7
Secondary	27.5	28.5	37.2
Low poverty rate			
5 percent or less	28.4	31.5	42.3
More than 40 percent	26.7	26.4	31.2
School size			
Less than 150	44.0	36.0	50.7
750 or more	23.8	27.4	33.9

SOURCE: Indicator 47 and tables 47-1 and 47-3, *Condition 1996*.

some classroom practices than others.

In school year 1993–94, the vast majority of teachers thought that they had a good deal of control in their own classroom over practices such as evaluating and grading students, selecting teaching techniques, and determining the amount of homework to be assigned. Relatively fewer felt that they had a good deal of control over disciplining students, deciding what was taught, and selecting textbooks and other instructional materials. Private school teachers were more likely to think that they had a great deal

of control in each of these areas, except for determining the amount of homework (Indicator 47, *Condition 1996*).

School safety

Percentage of public school teachers reporting they had a good deal of control over classroom practices: 1993–94

SOURCE: Indicator 47, *Condition 1996*.

Neither students nor teachers can perform at their best if they do not feel safe. Schools where teachers do not feel safe are likely to experience difficulty in attracting and retaining teachers. Perceptions of safety may be just as important as objective measures.

◆ *Some schools, especially those in central cities, find it necessary to implement security measures to protect students and staff.*

In 1993, 29 percent of children in grades 3–12 attended schools that employed security guards; 26 percent attended schools that locked the doors during the day; and 5 percent attended schools that had metal detectors. These precautions were far more common in central cities than in other types of communities (table 47-4, *Condition 1995*).

◆ *Increasing percentages of public school teachers are reporting that physical conflicts and weapons possession are moderate or serious problems in their schools.*

In school year 1993–94, 40 percent of public

Percentage of students in schools with various security devices: 1993

SOURCE: Table 47-4, *Condition 1995*.

secondary teachers reported that physical conflicts among students were moderate or serious problems in their schools, up from about 30 percent just 3 years earlier. During the same period, the percentage who reported that weapons possession was a moderate or serious problem nearly doubled. Fewer elementary than secondary school teachers reported these problems as moderate or serious, but the percentage reporting physical conflicts as a moderate or serious problem grew steadily between 1987–88 and 1993–94.⁵

SOURCE: U.S. Department of Education, National Center for Education Statistics, "How Safe Are the Public Schools: What Do Teachers Say?" *Issue Brief*, 1996.

Overall, 15 percent of high school seniors in 1992 reported that they were threatened at school some time during the first semester. The percentages were about the same regardless of schools' urbanicity, but seniors attending schools with fewer than 400 students were less likely to have been threatened (11 percent) than seniors in larger schools, where 15 to 16 percent had been threatened (table 47-3, *Condition 1995*).

- ♦ *Victimization rates of high school seniors have not changed dramatically.*

Despite teachers' perceptions of growing safety problems in the schools, victimization rates of high school seniors changed little between 1976 and 1993, with the exception of a slight increase in the percentages of students who reported being threatened with or without a weapon. The most common type of victimization for high school seniors was having something stolen (*Indicator 47, Condition 1995*).

- ♦ *About one in six high school seniors in 1992 had someone offer to sell them drugs at school during the first half of the school year.*

Because drug selling activity in a school is often

SOURCE: Indicator 47, *Condition 1995*.

accompanied by increased crime, the number of students reporting that they have been approached at school to buy drugs is indicative of the extent to which the school environment is affected by drug problems. Incidence in 1992 was greatest at public schools and least at private schools with a religious affiliation other than Catholic (*Indicator 48, Condition 1995*).

Student readiness to learn

Classes full of students ready and eager to learn make a teacher's job much easier and more enjoyable. Students who disrupt classes by being

SOURCE: Indicator 48, *Condition 1995*.

late or frequently absent make their teachers' jobs more difficult. Students who use drugs or alcohol can contribute to disruption of class activities and crime in the schools. Also, students' readiness to learn in English is affected by their ability to speak English. Unless teachers are trained in

teaching English as a second language or in bilingual education, having a large number of children with difficulty speaking English can make a teacher's job much more demanding.

- ♦ The percentage of high school sophomores who

came to school unprepared for class decreased between 1980 and 1990.

Percentage of high school sophomores who came to school unprepared in 1980 and 1990

Student behavior and year	Test quartile		
	Total	Lowest	Highest
Come to school without books			
1980	8.5	17.1	3.0
1990	6.3	12.8	2.5
Come to school without paper, pen, or pencil			
1980	15.1	21.9	10.8
1990	10.5	15.1	8.2
Come to school without homework completed			
1980	22.1	28.5	16.2
1990	18.1	23.8	14.3

SOURCE: Indicator 44, *Condition 1994*.

The proportion of high school sophomores who reported that they usually or often came to school without completed homework dropped from 22 percent to 18 percent between 1980 and 1990. The percentages who came without books, paper, or pen and pencil also dropped. In both years, there was a relationship between poor performance on reading, vocabulary, and mathematics tests and coming to school unprepared. However, students in the lowest test quartile improved in all three areas (Indicator 44, *Condition 1994*).

- ♦ Teachers in many public high schools think that student absenteeism and tardiness are serious problems.

At the high school level, 29 percent of public school teachers reported that student absenteeism was a serious problem in their school, and 19 percent reported that tardiness was a serious problem. Teachers in central city high schools

SOURCE: Indicator 42, *Condition 1996*.

Teachers in central city high schools were serious about drug and alcohol use in the 1980s, but marijuana use is on the increase again. Alcohol use has declined, but remains high.

In 1978, one-half of all high school seniors reported using marijuana during the previous year. Reported marijuana use dropped to 26 percent by 1993, but rose to 31 percent in 1994. Use of alcohol also dropped in the 1980s and early 1990s, but not as dramatically as marijuana, and overall use remains high (Indicator 48, *Condition 1995*).

Especially disturbing is the fact that 8 percent of high school seniors reported that they had been under the influence of alcohol while at school on at least 1 day during the previous month in 1993,

SOURCE: Indicator 48, *Condition 1995*.

and 9 percent reported that they had been under the influence of marijuana or other illegal drug at school (table 48-2, *Condition 1995*).

- ◆ *Increasing numbers of school-age children speak a language other than English at home and speak English with difficulty.*

In 1990, more than 5 percent of all school-age children spoke a language other than English at home and spoke English with difficulty, up from 4 percent in 1980. Thirty-three percent of these children lived in California. In five states (California, Texas, New Mexico, Arizona, and New York), more than 8 percent of school-age children spoke another language at home and had difficulty speaking English (Indicator 46, *Condition 1994*).

Respect for teachers

The public's level of respect for teachers is likely to affect the attractiveness of the teaching profession and the quality of new teachers. There is wide variation from country to country in the percentage who think that secondary teachers are "very respected" or "fairly well respected" as a profession.

- ◆ *Compared to secondary teachers in some other countries, secondary teachers in the United States are accorded a high degree of public respect.*

Among 10 European countries and the United States, an average of 9 percent of persons thought that secondary teachers were "very respected," and another 48 percent thought they were "fairly well respected." In the United States, 20 percent thought they were "very respected" and 48 percent thought they were "fairly well respected."⁶

Summary

Teachers put in more than a 40-hour week, on average, counting time spent outside of school hours. Their average salaries tend to be lower than many other professionals, but, adjusting for inflation, teachers' salaries increased substantially during the 1980s. Most teachers are supported in their professional development by their schools and districts. More than four out of five teachers reported that they had a good deal of control over how they taught and evaluated students. They were less likely to report that they had a great deal of control over selecting what they taught

and what texts and materials they used, and over disciplining students. Public school teachers are increasingly worried about school safety at both the elementary and secondary levels, although victimization rates reported by high school seniors have not changed dramatically since the 1970s.

In some ways, public school teachers as a group appear to face more difficult working conditions than private school teachers. They have larger classes, on average, are less likely to think that teachers have a good deal of influence over important policies in their schools, and are less likely to think that they have a great deal of control over most classroom practices. They are also more likely to think that absenteeism and tardiness are serious problems in their schools, and public high school seniors are more likely to report that someone offered to sell them drugs at school. However, public school teachers earn substantially more than private school teachers, on average.

Working conditions vary considerably within the public school sector, depending on size, location, and percentage of low income students in the school. For example, central city public schools are more likely than those in other types of communities to have safety problems and higher absentee rates. Teachers in small public schools tend to have smaller classes than teachers in large schools and are more likely to think that teachers have a good deal of influence over school policies.

Access, Participation, and Progress

Participation

Because of mandatory school attendance laws, enrollment rates among children aged 6–15 are close to 100 percent. Among younger children, however, enrollment rates have increased substantially over the past quarter century. In 1993, 27 percent of 3-year-olds and 54 percent of 4-year-olds were enrolled in school, up from 13 percent and 29 percent, respectively, in 1970. In 1994, almost all 5-year-olds (95 percent) were enrolled in school, compared to 81 percent in 1970 (*Indicator 1*).

Enrollment rates (in schools and colleges) among 16- to 24-year-olds have also increased considerably. The enrollment rate among 20-year-olds, for example, was 47 percent in 1994, up from 39 percent in 1970 (*Indicator 1*). This increase in enrollment among 16- to 24-year-olds reflects the increasing proportion of high school graduates going on to college (*Indicator 7*), and to a lesser extent, it also reflects decreasing high school dropout rates (*Indicator 5*).

Beyond traditional college age, enrollment rates taper off, with 15 percent of 25-year-olds and 6 percent of 34-year-olds enrolled in college in 1994. Enrollment rates for those aged 25–34 have remained relatively stable since 1970 (*Indicator 1*).

Participation in adult education activities, an important avenue for acquiring new knowledge and upgrading skills, has been increasing. In 1995, 40 percent of all adults participated in adult education activities, up from 32 percent in 1991. Their reasons for participating varied, and some adults took more than one type of course. In 1995, 21 percent of all adults who participated in adult education took work-related courses; 20 percent took personal development courses; 6 percent took courses toward a credential (other than on a full-time basis); and 1 percent took basic skills courses (*Indicator 14*).

The enrollment patterns described above varied by race/ethnicity. For example, at ages 3 and 4, similar percentages of white and black children were enrolled in school in 1995, while their Hispanic peers were much less likely to be enrolled. At age 5, however, children in all three racial/ethnic groups were about equally likely to be enrolled (*Indicator 2*).

Racial/ethnic differences in participation rates exist in higher education as well. In 1994, the percentages of high school graduates aged 18–24 who were enrolled in college were lower for blacks and Hispanics (36 and 33 percent, respectively) than for whites (44 percent) (*Indicator 8*). White adults were more likely than either their black or Hispanic peers to participate in adult education activities in 1995: 42 percent compared to 37 percent and 34 percent, respectively (table 14-1).

Access

Access to preschool for 3- and 4-year-olds is related to family income. In 1995, 61 percent of 3-year-olds and 81 percent of 4-year-olds from families with incomes of more than \$50,000 were enrolled in school. For children from families in lower income groups, however, enrollment rates ranged from 26 to 38 percent for 3-year-olds and from 52 percent to 60 percent for 4-year-olds (*Indicator 2*). This is not surprising because nursery schools are mostly private—representing 62 percent of prekindergarten enrollment in 1992 (*Indicator 37, Condition 1994*)—and charge tuition. The gap in enrollment rates closes by age 5 (*Indicator 2*), because kindergartens are primarily public—representing 85 percent of enrollment in 1992 (*Indicator 37, Condition 1994*).

Many children are attending schools over which their parents have exercised some choice. In 1993, more than half of all students in grades 3–12 were in this category. Twenty percent of students in grades 3–12 attended a school chosen by their parents. In addition, parents of 39 percent of students reported that their child attended an assigned public school, but their choice of residence was influenced by where the child would go to school. Children from families with incomes greater than \$50,000 were more likely than children from families with incomes less than \$15,000 to have parents who made both of these choices (*Indicator 4*).

The percentage of high school graduates enrolling in college immediately after high school has increased—from 49 percent in 1972 to 62 percent in 1994. Access to college has increased for high school graduates from families at all income

levels, but enrollment rates still vary with income. In 1994, 45 percent of high school graduates from low income families went directly to college, compared to 77 percent of high school graduates from high income families (*Indicator 7*).

This increase in immediate college enrollment has occurred despite the fact that the cost of college attendance has increased much faster than family income. In 1980, average undergraduate tuition, room, and board at public institutions was equal to 10 percent of the median income for families with school-aged children. By 1994, it reached 14 percent. At private institutions, tuition, room, and board increased from 22 to 39 percent of the median income for families with school-aged children (*Indicator 12*).

Student financial aid programs have helped reduce the cost of going to college, particularly for students from low income families. For example, grants covered an average of 29 percent of tuition and fees for all full-time dependent undergraduates at 4-year public institutions and 80 percent for students from low income families (*Indicator 13*).

Progress

Historically, the majority of children in first grade have been 6 years old, but the percentage of first-graders who are 7 years or older has increased, rising from 13 percent in 1972 to 22 percent in 1994. The increase has been particularly striking among first-graders from high income families: 9 percent were 7 years or older in 1972, compared to 22 percent in 1994 (*Indicator 3*). The increase is due to some combination of parents keeping children in preschool or at home longer, children repeating kindergarten or first grade, and states and districts changing the minimum age for starting school.

Since school attendance is usually mandatory for children 6 to 15 years old, persistence for this age group is not an issue. In the later years of high school, however, persistence becomes a matter of serious concern because of the negative economic and social consequences associated with dropping out. In October 1994, 5 percent of the students who had been in grades 10–12 the previous fall had dropped out of school during the year or had failed to return in the fall. Dropout rates were closely related to family income: 2 percent of

students from high income families dropped out, compared to 13 percent of students from low income families (*Indicator 5*).

High school persistence has improved over the past decade: 88 percent of the sophomore class of 1990 completed high school on time, compared to 80 percent of the sophomore class of 1980. Moreover, dropouts from the sophomore class of 1990 were considerably more likely than their counterparts a decade earlier to return to school. Two years after their scheduled graduation, 58 percent of the 1990 sophomore dropouts either had completed or were re-enrolled in school, compared to 34 percent of the dropouts from the sophomore class of 1980 (*Indicator 6*).

Persistence at the postsecondary level also is of concern because of the increased employment opportunities and income potential that accrue to bachelor's degree recipients. Among bachelor's degree seekers who enrolled in postsecondary education for the first time in 1989–90, 77 percent of those who began at a 4-year institution and 53 percent of those who began at a 2-year institution had completed some degree or were still working toward a bachelor's degree 5 years later (*Indicator 10*).

Many students who start at a community college do not complete their education at the first institution in which they enroll. Among students who began their postsecondary education at a community college in 1989–90, 37 percent completed a degree at some institution by 1994; 22 percent of these students completed a certificate or associate's degree at their first institution. About one in five community college beginners later went to a 4-year institution as their first transfer (table 9-2).

The traditional time for completing a bachelor's degree is 4 years. In 1993, 31 percent of bachelor's degree recipients had completed their degree within 4 years of graduating from high school, and 70 percent completed their degree within 6 years. The proportion who completed within 4 years of high school graduation dropped from 45 percent to 31 percent between 1977 and 1990, but did not change between 1990 and 1993 (*Indicator 11*).

School enrollment rates, by age

- ◆ Since 1970, almost all children between the ages of 6 and 15 have been enrolled in school.
- ◆ Enrollment rates for 3- to 5-year-olds were substantially higher in 1993 than in 1970. However, most of this increase had occurred by 1980.

Even though participation in formal education is generally only mandatory for those between ages 6 and 16, learning occurs throughout a person's life. School enrollment rates of younger and older persons are an indication of the importance of formal education in their lives

- ◆ Enrollment rates among 16- to 25-year-olds were higher in 1994 than in 1970. Enrollment rates among those over age 25 generally did not increase during this period

Preprimary education enrollment

- ◆ In 1995, 37 percent of 3-year-olds, 61 percent of 4-year-olds, and 90 percent of 5-year-olds were enrolled in center-based programs or kindergarten. Among 5-year-olds from various family backgrounds, enrollment rates were similar.
- ◆ At ages 3 and 4, similar percentages of white and black children were enrolled in center-based programs and kindergarten in 1995, while their Hispanic peers were much less likely to be enrolled. At age 5, blacks and Hispanics were more likely than whites to be enrolled in kindergarten.
- ◆ In 1995, 3- and 4-year-olds from families with incomes of \$50,000 or less were less likely to be enrolled than 3- and 4-year-olds from families with incomes of more than \$50,000.
- ◆ There was a positive relationship between parents' educational attainment and enrollment rates of 3- to 4-year-olds. As parental educational attainment increased, preprimary enrollment rates increased.
- ◆ At ages 3 and 4, enrollment rates for children who lived with one biological or adoptive parent were similar to those of children who lived with two biological or adoptive parents.

Participating in early childhood programs such as Head Start, nursery school, prekindergarten, and kindergarten provides children with valuable experience before entering first grade. Instruction received at the preprimary level may help prepare children to participate in elementary school. Many policymakers and educators believe that it is important to help children from disadvantaged backgrounds start elementary school on an equal footing with other children by involving them and their parents in preprimary programs beginning at earlier ages.

Percentage of 3-, 4-, and 5-year-olds enrolled in center-based programs and kindergarten, by race/ethnicity, family income, parents' highest education level, and family structure: 1995

Age of first-graders

- ◆ **One in five first-graders was age 7 or older in 1994, compared to one in eight in 1972.**
- ◆ **In general, between 1972 and 1993, first-grade students from low income families were more likely to be age 7 or older than were first-grade students from high income families.**
- ◆ **Since 1972, a higher percentage of males than females in first grade have been age 7 or older.**
- ◆ **Between 1972 and the mid-1980s, the percentage of white first-graders who were age 7 or older increased faster than that of their black and Hispanic counterparts. Since the mid-1980s, similar percentages of white, black, and Hispanic first-graders were age 7 or older.**

For generations, the majority of children in first grade have been 6 years old. Children age 7 or older are in first grade for a variety of reasons: their parents kept them in preschool or at home longer; they turned 6 after a state-mandated cut-off date; they were retained in kindergarten or first grade; or they missed school due to illness or other reasons. Changes in the age of first-graders could indicate the differences in the occurrences of these factors for various groups.

Percentage of first-grade students age 7 or older, by family income, sex, and race/ethnicity: October 1972–94

October	Total	Family income *			Sex		Race/ethnicity

Table reads: In 1994, 22.4 percent of first-graders were age 7 or older.

— Not available.

* Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent in-between.

NOTE: The percentage of first-graders age 7 or older in October can be affected by changes in the minimum age requirement for children starting school set by states and school districts. For example, between 1984 and 1991, seven states (with about 8.3 percent of elementary school enrollment) increased the minimum age requirement for children starting school by an average of 2 months, which could account for about a 1.3 percentage point increase in the percentage of first-grade students age 7 or older.

School choice

- ◆ In 1993, 20 percent of students in grades 3–12 attended a school chosen by their parents. Of these students, 11 percent attended a public school, and 9 percent attended a private school. In addition, parents of 39 percent of students reported that their child attended an assigned public school, but their choice of residence was influenced by where the child would go to school.
- ◆ Black students were more likely than white students to attend a school chosen by their parents (23 compared to 19 percent). Of those students who attended a school chosen by their parents, black students were more likely to attend a public school, while white students were more likely to attend a private school.
- ◆ Students from families with incomes over \$50,000 were more likely than students from families with incomes less than \$15,000 to attend a chosen school. In fact, 16 percent of students from families with incomes over \$50,000 attended private schools, while 9 percent attended a chosen public school.
- ◆ Parents whose children were enrolled in a private school were more likely to be satisfied with certain aspects of the school than were parents whose children attended other types of schools. Parents whose children were enrolled in a chosen school were more likely than parents whose child attended an assigned public school to be satisfied with aspects of their child's school, such as the school itself, teachers, academic standards, and discipline policy (see supplemental table 4-4).

Since the late 1980s, school choice has become a popular education reform strategy. Parents who select which school their child attends do so for a variety of reasons, including academic, religious, or moral environment and convenience. Differences in the proportion of students who attend an assigned school and those who attend a school selected by their parents may reflect greater parental involvement and may increase competition among schools to attract and retain students.

Percentage distribution of students in grades 3–12 who attended a chosen or assigned school, by race/ethnicity, urbanicity, parents' highest education level, and family income: 1993

Dropout rates

- ◆ In October 1994, 5 percent of students who were in grades 10–12 the previous October were not enrolled again and had not graduated from high school—that is, they had dropped out of high school sometime during the year.
- ◆ Generally, between 1972 and 1994, black and Hispanic high school students were more likely to drop out than whites. Also, students from low income families were more likely to drop out of high school than were their counterparts from middle and high income families.

Students who drop out of school have fewer opportunities to succeed in the work force or to assume a fully functional place in society at large than those students who complete high school. The event dropout rate is one of several ways to define dropout rates. It is a measure of the proportion of students who drop out in a single year without completing high school.

Event dropout rates¹ for those in grades 10–12, aged 15–24, by sex, race/ethnicity, and family income: October 1972–94
income: October 1972–94

Dropouts who complete high school within 2 years of scheduled graduation

- ◆ **Eighty-eight percent of the 1990 cohort had completed high school by August following their senior year of high school, compared to 80 percent of the sophomore class of 1980.**
- ◆ **Dropouts from the 1990 sophomore class were more likely to return to school than were their counterparts a decade earlier. Almost 58 percent of dropouts from the 1990 cohort either completed or were re-enrolled in school 2 years after their scheduled graduation, compared to 34 percent of dropouts from the 1980 cohort.**
- ◆ **Compared to their peers, dropouts who had poor basic skills in mathematics (test performance in the lowest quartile for their cohort) were less likely to receive an alternative credential such as a GED, and were more likely not to have completed high school 2 years later.**

The decision to drop out of school does not always indicate the culmination of a young person's education. Many former students reconsider their decision to drop out and return to high school. Also, in the American educational system, alternative programs are available that give dropouts a "second chance" to complete their high school education. These programs include regular high school diploma programs as well as programs leading to a high school credential after passing the General Educational Development (GED) Tests.

Percentage of 1980 and 1990 sophomore classes in August 1982 and 1992 and spring 1984 and 1994 according to educational status, by selected characteristics and 1994 according to educational status, by selected characteristics

Selected characteristics	Status in August following scheduled high school graduation			Status of August dropouts in the spring 2 years later				Total completed spring 2 years following scheduled graduation
	Completed high school ¹		Dropout	Graduated	Received alternative credential	Enrolled in high school ²	Still dropouts	
		Still enrolled ²

Status of 1980 and 1990 sophomores who did not graduate on schedule 2 years after scheduled high school graduation

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond (HS&B) study, Sophomore Cohort, Base Year, First, and Second Follow-up Surveys, and National Education Longitudinal Study of 1988, First, Second, and Third Follow-up Surveys.

Immediate transition from high school to college

- ◆ **Between 1973 and 1994, the proportion of high school graduates going directly to college increased from 47 to 62 percent.**
- ◆ **High school graduates from low income families were more likely to go directly to college in 1994 than in 1972. Still, in 1994, only 45 percent of high school graduates from low income families went directly to college, compared to 77 percent of those from high income families.**
- ◆ **In 1994, 65 percent of white high school graduates enrolled in college, compared to 51 percent of their black counterparts.**
- ◆ **In 1994, high school graduates aged 16–24 who had at least one parent with a bachelor’s degree were more likely to go directly to college than those graduates whose parents did not have a bachelor’s degree (83 percent versus 43 to 65 percent) (see supplemental table 7-3).**

Since most college students enroll in college immediately after completing high school, the percentage of high school graduates enrolled in college the October following graduation is an indicator of the total proportion of that year’s high school graduates who will ever enroll in college. The percentage enrolling not only reflects the accessibility of higher education to high school graduates, but also shows their assessment of the value of attending college compared to working, entering the military, traveling, or other possible pursuits.

Percentage of high school graduates aged 16–24 enrolled in college the October following graduation, by type of college, family income, and race/ethnicity: Selected Octobers 1972–94

October	Total	Type of college		Family income			Race/ethnicity		
		2-year	4-year	Low	Middle	High	White	Black	Hispanic
1972	49.2	—	—	26.1	45.2	63.8	49.7	44.6	45.0

Racial and ethnic differences in participation in higher education

- ◆ **Between 1992 and 1994, white high school graduates aged 18–24 were more likely to be enrolled in college than were their black and Hispanic counterparts. For these years, the average enrollment rate for whites was 9 and 8 percentage points higher than that of blacks and Hispanics, respectively.**
- ◆ **The percentage of high school graduates aged 18–24 enrolled in college was higher in 1994 than in 1972 for whites and blacks. During this period, white high school enrollment rates grew substantially, rising from 33 to 44 percent, with most of the growth occurring after 1981. Enrollment rates for blacks of the same age grew moderately over this period.**
- ◆ **Between 1992 and 1994, the average enrollment rates in 2-year colleges were similar for white and black high school graduates aged 18–24. Hispanic high school graduates of the same age were somewhat more likely than their white or black counterparts to be enrolled in 2-year institutions. However, both black and Hispanic high school graduates aged 18–24 were substantially less likely to be enrolled in 4-year institutions than were their white counterparts (see supplemental table 8-1).**
- ◆ **Enrollment rates for older adults, high school graduates aged 25 or older, generally were much lower than those for their younger counterparts aged 18–24 regardless of racial and ethnic group. Between 1992 and 1994, 3-year average college enrollment rates were similar for white, black, and Hispanic high school graduates aged 25–34.**

Racial and ethnic differences in college enrollment rates may reflect differences in access to and persistence in higher education for groups with varying social and economic backgrounds. Differing enrollment rates are also a leading indicator of future differences in the earnings and productivity associated with postsecondary education. The college enrollment rate for 18- to 24-year-olds is influenced by the number who enroll immediately after graduating high school, the number who delay entry, and the number of years individuals in both of these groups stay in higher education.

Percentage of high school graduates enrolled in college, by age and race/ethnicity: October 1972–94

October	Aged 18–24				Aged 25–34				Aged 35 or older

Community college outcomes

- ◆ Among students who began their postsecondary education at a community college in 1989–90, 37 percent completed a degree at some institution by 1994; 22 percent of these students completed a certificate or an associate’s degree at their first institution. Those who did not complete an award at their first institution spent a substantial amount of time there—an average of 14 months of enrollment.
- ◆ Nineteen percent of 1989–90 community college beginners transferred to a public 4-year institution, and 3 percent transferred to a private 4-year institution (see supplemental table 9-2). Of those who transferred to a 4-year institution, 38 percent completed an associate’s degree before transferring.
- ◆ By 1994, 26 percent of those who transferred to 4-year institutions had completed a bachelor’s degree, and 47 percent were still enrolled at a 4-year institution.
- ◆ The higher a student’s socioeconomic status (SES), the more likely that student was to transfer to a 4-year institution; 35 percent of high SES students transferred, compared to 21 percent of middle SES and 7 percent of low SES students (see supplemental table 9-2).

About 45 percent of first-time undergraduates attend public 2-year colleges. These institutions serve many purposes: they provide vocational training and skill development; they offer an inexpensive way to complete lower division requirements before entering a 4-year institution; and they meet avocational interests. Examining outcomes for students who began their postsecondary education at public community colleges provides insight into how these diverse needs are being met.

Among 1989–90 beginning students at community colleges, percentage distribution and average number of months enrolled at first institution, by attainment at first institution and 1994 attainment/enrollment status

Persistence toward a bachelor's degree

- ◆ Among beginning students seeking bachelor's degrees in 1989–90, three-quarters (77 percent) of those who began in 4-year institutions and more than half (54 percent) of those who began in 2-year institutions reported completing some degree or were still working toward a bachelor's degree 5 years later. Students who began in 4-year institutions were much more likely to have reported completing a bachelor's degree in 5 years than those who began in 2-year institutions (57 versus 8 percent).
- ◆ Students who entered postsecondary education at age 18 or younger were more than twice (51 versus 19 percent) as likely as those who entered between the ages of 20 and 29 to have reported completing a bachelor's degree within 5 years, and five times more likely than students who entered at age 30 or later.
- ◆ Half of bachelor's degree seekers (52 percent) who first enrolled on a full-time basis reported having completed that degree within 5 years, compared to less than 15 percent of those who first enrolled less than full time.
- ◆ As socioeconomic status (SES) and parents' educational attainment levels increased, so did the likelihood of completing a bachelor's degree, or any degree, within 5 years. Bachelor's degree seekers of lower SES or whose parents had less education were more likely to have reported completing no degree (see supplemental table 10-1).

Personal, financial, and academic circumstances often interfere with the persistence required to complete bachelor's degree programs. Understanding the relationship between these circumstances and students' paths through postsecondary education is essential to help them succeed.

Percentage distribution of 1989–90 beginning postsecondary students seeking bachelor's degrees according to persistence toward and completion of bachelor's and other degrees as of spring 1994, by selected characteristics

Time to complete a bachelor's degree

- ◆ **In 1993, about 31 percent of college graduates completed their bachelor's degree within 4 years after graduating from high school. The proportion who completed a bachelor's degree in 4 years after high school graduation dropped from 45 to 31 percent between 1977 and 1990, but did not change between 1990 and 1993. Females were more likely than males to complete their degree in 4 years.**
- ◆ **About 36 percent of 1993 graduates completed a bachelor's degree within 4 years of beginning their postsecondary education, while 26 percent took more than 6 years to do so. Students who delayed their college enrollment or who began in a 2-year institution were more than twice as likely to take more than 6 years after starting college to complete their bachelor's degree.**
- ◆ **Students who received their bachelor's degree from a private 4-year institution were much more likely to complete their degree within 4 years of starting college than were students who graduated from a public 4-year institution; students in public 4-year institutions were more likely to completed their degree in 5 years.**

The traditional time to complete most bachelor's degrees is 4 years, but a number of circumstances such as changing schools or majors, stopping out for periods of time, attending school on a part-time basis, or having difficulty enrolling in required classes may delay graduation. Increased time to complete their degree can be costly to students who incur additional tuition and postponed entry into the labor market.

Percentage of college graduates completing a bachelor's degree within various years following their high school graduation, by sex: Years of college graduation 1977, 1986, 1990, and 1993

Year of college graduation	Total				Male				Female			
	4 years or less	5 years or less	6 years or less	More than 6 years	4 years or less	5 years or less	6 years or less	More than 6 years	4 years or less	5 years or less	6 years or less	More than 6 years

College costs and family income

- ◆ **Between 1980 and 1994, college costs (tuition, room, and board) rose rapidly in both public and private institutions, but increased more at private colleges than at public colleges (71 versus 45 percent in 1995 constant dollars).**
- ◆ **Between 1980 and 1994, tuition, room, and board at public institutions increased from 10 to 14 percent of median family income (for families with children 6 to 17 years old). This increase was larger for low income families than for high income families—it increased from 16 to 26 percent for families at the 25th percentile of family income, compared to an increase from 7 to 9 percent for those at the 75th percentile.**
- ◆ **After periods of decline in the 1960s and 1970s, tuition, room, and board at public institutions rose to a high of 15 percent of median family income (for all families) in 1993. At private institutions, tuition, room, and board as a percentage of median family income rose every year between 1979 and 1993, increasing from 23 to 41 percent (see supplemental table 12-1).**

A family's ability to afford college for its children depends on many factors, including tuition levels, availability of financial aid, family income and assets, and family size. Tuition, room, and board are a measure of the gross price of college. The average cost for tuition, room, and board as a percentage of family income is an indicator of the affordability of a college education.

Average undergraduate tuition, room, and board (in 1995 constant dollars) as a percentage of income of families with children 6 to 17 years old,¹ by control of institution and selected family income percentiles: 1975–94

Year	Public institutions						Private institutions					
	Constant dollars	Family income percentile					Constant dollars	Family income percentile				
		10th	25th	50th	75th	90th		10th	25th	50th	75th	90th

¹ These families may have children aged 18 and older; however, they have at least one child between 6 and 17 years old, and none under 6. All families, not just married-couple families, are included. Supplemental table 12-1 provides data for a longer series of years, but is based on the incomes of all families.

² Revised from previously published figures.

³ Preliminary data based on fall 1993 enrollment weights.

NOTE: Tuition data are for academic years beginning 1975–94, and family income data are for calendar years 1975–94. Both calendar and school year Consumer Price Indexes (CPIs) were used to calculate constant dollar figures. "Tuition, room, and board" includes those for 2-year and 4-year colleges and universities. In-state tuition and fees are used for public institutions.

Net cost of attending postsecondary education

- ◆ Among all dependent, full-time undergraduate students attending public 4-year institutions, average grant aid received was 29 percent of the average tuition and fees charged during the 1992–93 academic year. This ratio varied from 80 percent for students from low income families to 10 percent for those from high income families. This ratio also varied from 16 percent for dependent, full-time students at private, for-profit institutions (calculated from supplemental table 13-1) to 37 percent for those at public 2-year institutions.
- ◆ The average net cost (total cost minus total aid) was 80 percent of the average total cost (\$7,326 versus \$9,187) for dependent, full-time undergraduates attending public 4-year colleges. This ratio varied from 57 percent for students from low income families to 91 percent for those from high income families. This ratio also varied from 89 percent for students attending public 2-year colleges to 67 percent for students attending private, not-for-profit 4-year institutions.
- ◆ Among independent, full-time students at private, for-profit institutions, the average grant aid received (\$1,346) was 28 percent of the average tuition and fees charged (\$4,748). This ratio varied from 37 to 18 percent for students with low to high household income (calculated from supplemental table 13-1).

Cost may affect a student's access to a college education. The net cost of college attendance is total cost minus total aid—that is, tuition, fees, and living expenses minus grants, loans, and work study. Net cost as a percentage of total cost is a measure of the fraction of cost that remains to be financed by students and their families after student financial aid is used. However, living expenses arguably must be incurred whether or not a student attends college; loans must be repaid; and work study is payment for work. A second measure, grant aid as a percentage of tuition and fees paid, provides an indication of the discount received on educational expenses.

Cost of college attendance and student financial aid for dependent, full-time undergraduates, by type and control of institution and family income: Academic year 1992–93

Type and control of institution and family income of dependent students	Tuition and fees	Total cost	Grant aid	Total aid	Net cost	Ratios	
						Grants to tuition and fees	Net cost to total cost
Public 4-year institutions							
Dependent, full-time students	\$2,947	\$9,187	\$855	\$1,864	\$7,326	29	80
Low income	2,559	8,820	2,041	3,746	5,070	80	57
Lower middle	2,728	8,878	961	2,422	6,426	35	72
Upper middle	2,846	8,924	509	1,331	7,598	18	85
High income	3,382	9,758	354	890	8,879	10	91
Private, not-for-profit 4-year							
Dependent, full-time students	11,004	17,301	3,455	5,697	11,552	31	67
Low income	8,444	14,232	5,417	8,350	5,872	64	41
Lower middle	10,560	16,905	4,890	8,270	8,590	46	51
Upper middle	11,195	17,422	4,240	6,934	10,407	38	60
High income	12,399	18,958	1,736	3,150	15,752	14	83
Public 2-year							
Dependent, full-time students	1,072	6,410	395	600	5,717	37	89
Low income	948	6,199	1,027	1,322	4,848	108	78
Lower middle	1,052	5,995	312	588	5,348	30	89
Upper middle	1,134	7,060	122	247	6,686	11	95
High income	1,311	6,745	83	167	6,367	6	94

Table reads: In academic year 1992–93, the average grant for dependent, full-time students at public 4-year institutions was \$855.

NOTE: Total cost includes budget allowances for student living expenses; total aid includes grants, loans, and work study; net cost is total cost minus total aid. See the supplemental note to this indicator for more detailed definitions of concepts.

Participation in adult education

- ◆ **Forty percent of adults participated in adult education activities in 1995, up from 32 percent in 1991. Of those adults who participated in 1995, about half (21 percent) took work-related courses, half (20 percent) took personal development courses, and 6 percent took courses related to a diploma, degree, or certification.**
- ◆ **In both 1991 and 1995, adults with more education generally were more likely to participate in adult education activities than those with less education. In fact, almost 6 in 10 adults who had a bachelor's degree or higher participated in adult education, while in 1995, 3 in 10 adults who had a high school diploma did so.**
- ◆ **Employed adults were more likely to participate in adult education than those without jobs. In 1995, among those who were employed, participation rates of females were 9 percentage points higher than those of their male counterparts. Moreover, employed females were more likely than employed males to take work-related or personal development courses (see supplemental table 14-1).**
- ◆ **Among those who participated in work-related courses, the majority (60 percent) took courses provided by business or professional associations. About 20 percent took work-related courses provided by colleges, and 17 percent took work-related courses provided by government agencies (see supplemental table 14-2).**

In an age of rapid technological and economic change, lifelong learning is essential, both for individuals and for society as a whole. Adult education provides an avenue for acquiring new knowledge and upgrading workers' skills. Differences in participation rates among various groups may indicate the degree of access or the rewards of participation for these individuals.

Adult education participation rates in the past 12 months, by type of adult education activity, educational attainment, and labor force status: 1991 and 1995

Educational attainment and labor force status	1991 total	1995				
		Total ¹	Type of adult education activity			
			Basic skills ²	Credential ¹	Work-related	Personal
Total	31.6	40.2	1.2	6.1	20.9	19.9
Educational attainment						
Grade 8 or less	7.2	10.8	2.1	0.2	2.2	5.2
Grades 9–12 ³	14.3	22.9	5.6	1.6	6.9	10.4
High school diploma	22.5	30.9	0.8	3.5	14.2	15.7
Vocational/technical school	31.7	41.9	0.6	5.4	21.9	21.1
Some college	39.4	49.3	0.5	12.1	22.3	25.3
Associate's degree	49.1	56.1	0.4	10.9	32.1	27.4
Bachelor's degree or higher	52.2	58.2	(*)	7.7	37.9	27.9
Labor force status						
Employed	40.8	50.7	1.1	8.2	31.1	22.0
Unemployed	27.5	36.6	5.0	5.5	11.1	17.4
Not in labor force	14.5	21.3	0.9	2.2	3.4	16.2

Table reads: In 1995, 40.2 percent of adults participated in adult education; 20.9 percent of adults took work-related courses.

¹ The participation rate of adults aged 17 or older was determined by their involvement in one or more of six types of adult education activities in the 12 months prior to the interview; percentages may not add to totals because people participated in more than one type of activity (9 percent in 1995). Adults who participated in apprenticeship programs and English as a Second Language programs were included in the total, but are not shown separately. Adults who reported that they had participated only as full-time credential seekers were not included in the calculation of the participation rates.

² Only adults who had not received a high school diploma or equivalent, who had received a high school diploma in the past 12 months, or who had received a high school diploma in a foreign country were asked about their participation in the basic education/General Educational Development (GED) activities.

³ In 1995, includes adults whose highest education level was grades 9–12 who had not received a high school diploma; in 1991, includes only adults whose highest education level was grades 9–11.

⁴ Individuals with a bachelor's degree or higher were not asked about their participation in adult basic skills programs, GED preparation classes, adult high school, or high school equivalency programs.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1991 and 1995 (Adult Education Component).

Adult education participation rates in the past 12 months, by educational attainment and labor force status: 1991 and 1995

* In 1995, includes adults whose highest education level was grades 9–12 who had not received a high school diploma; in 1991, includes only adults whose highest education level was grades 9–11.

Achievement, Attainment, and Curriculum

Indicators of what students have learned in school are perhaps the most important measures of the outcomes of education. Although performance on examinations is one measure of what students have learned in school, examinations do not measure the wide array of skills and experiences that formal education provides. Educational attainment (e.g., finishing high school or college) is not only an indirect measure of how much subject matter students may have learned, but also of how much knowledge students potentially have gained in learning civic responsibilities, social skills, work ethics, and life skills. Furthermore, information about courses taken in high school and fields of study in college is an additional indirect indicator of the content of students' knowledge.

Achievement

The National Assessment of Educational Progress (NAEP) has assessed students' knowledge in reading, writing, science, mathematics, and other subjects for more than 20 years. NAEP analyzes both short- and long-term trends. One short-term trend indicates that reading proficiency remained relatively stable for 4th- and 8th-grade students between 1992 and 1994, while scores for 12th-graders decreased slightly (*Indicator 17*). A long-term trend shows that average science proficiency among 9-year-olds was higher in 1992 than in 1970; among 13-year-olds, it was about the same in 1992 as in 1970; and among 17-year-olds, it was lower (*Indicator 16*).

Mathematics achievement is assessed in three ways: through NAEP for 9-, 13-, and 17-year-olds; through the SAT and the ACT for college-bound high school seniors; and through the GRE for college graduates intending to continue their education. NAEP shows that average mathematics proficiency among 9- and 13-year-olds was slightly higher in 1992 than in 1973, and among 17-year-olds, it was about the same in 1992 as in 1973 after declining in the late 1970s (*Indicator 16*). Average scores on the mathematics section of the SAT fell somewhat during the 1970s, but rose during the early 1980s and early 1990s (*Indicator 22*). Unlike the case for 17-year-olds in NAEP, not all of the decline in SAT mathematics scores during the 1970s has been recouped.

Participation in the SAT exam has increased significantly, however. In 1995, 42 percent of high school seniors took the SAT, up from 32 percent in 1976 (table 22-1). During the same period, the percentage of minority test-takers has doubled—rising from 15 to 31 percent. The percentage of graduating seniors who took the ACT has risen, from 32 percent in 1991 to 37 percent in 1995. The ACT composite scores, however, have not changed during this time period (table 22-7). GRE test-takers as a percentage of college graduates rose from 29 percent in 1980 to 35 percent in 1993. Also, GRE quantitative scores increased 45 points between 1973 and 1993, mainly due to a sharp rise in scores during the 1980s (*Indicator 21, Condition 1995*).

Although overall scores have changed little over the last two decades, NAEP shows that the large gaps in achievement between whites and minorities have narrowed somewhat. Blacks have improved relative to whites in mathematics and science. For example, in 1973, average mathematics proficiency scores for 17-year-old blacks and Hispanics were well below those for 17-year-old whites (40 and 33 scale points, respectively). Although the gap was still large in 1992, the mathematics proficiency scores for 17-year-old white students increased only 2 scale points between 1973 and 1992, and the scores for 17-year-old blacks and Hispanics increased 16 and 15 scale points, respectively (*Indicator 16*). The same trend is evident in SAT mathematics scores between 1976 and 1995. Even though the mathematics scores of whites increased only 5 points over that period, those of blacks increased by 34 points and those of Hispanics by 10 to 16 points (*Indicator 22*).

In 1994, NAEP also assessed history and geography achievement (*Indicators 18 and 19*). U.S. history scores of whites and Asians were higher than those of blacks and Hispanics across all three grade levels, although the differences between the scores of blacks and whites and of Hispanics and whites were smaller in 8th and 12th grades than in 4th grade. In geography, at all three grade levels, males outperformed females; white and Asian students outperformed black and Hispanic students; and Hispanic students outperformed black students.

International comparisons

International comparisons of student achievement are available in basic reading literacy, mathematics, and science. Generally, U.S. students compare favorably to their counterparts in other large industrialized countries in reading, but unfavorably in mathematics and science; nevertheless, 9-year-olds from the United States are ranked higher in science than 9-year-olds from several other large industrialized countries (*Indicators 20, 23, and 24*).

Adult literacy

In 1992, the literacy of adults aged 16 and older was assessed in three areas: prose, document, and quantitative. Approximately 20 percent of the adults in the United States performed at a low proficiency level. In each of the three areas, scores of whites averaged 67 to 75 points higher than those of Hispanics and 50 to 63 points higher than those of blacks. In addition, older Americans had lower literacy scores than younger Americans, and adults with more education had higher literacy scores than adults with less education (*Indicator 21 and tables 20-1 and 20-3, Condition 1994*).

Adult literacy was assessed across seven countries in 1994. Relative to most other countries assessed, the United States had a large concentration of adults score at the highest literacy levels across the prose, document, and quantitative literacy domains. However, the United States also had a greater concentration of adults at the lowest levels of literacy (*Indicator 21*).

Attainment

High school completion

In 1995, 87 percent of all 25- to 29-year-olds had a high school diploma or an equivalency certificate, up from 78 percent in 1971. However, the completion rate varied among racial/ethnic groups. In 1995, 93 percent of whites had a high school diploma or the equivalent, compared to 87 percent of blacks and 57 percent of Hispanics. Blacks showed the most improvement: the percentage of blacks earning a high school diploma or equivalency certificate rose 28 percentage points between 1971 and 1995, compared to 11 and 9 percentage points for whites and Hispanics, respectively (*Indicator 25*). In terms of high school attainment, the United

States compares favorably to other large industrialized countries. For instance, the United States has a similar or higher percentage of 25- to 64-year-olds who have completed high school than many other countries (*Indicator 27*). However, with respect to young adults aged 25–34, several other nations approach or surpass U.S. secondary education completion rates (table 27-1).

College attainment

In 1995, among 25- to 29-year-olds who had completed high school, 62 percent had completed at least some college, and 28 percent had earned a bachelor's degree or more (*Indicator 25*). In the United States, a larger proportion of young adults had earned college degrees compared to their counterparts in most other industrialized countries (*Indicator 27*). Two-thirds of all students who were high school sophomores in 1980 had attended some form of postsecondary education by 1992, and almost one-fourth had graduated from a 4-year institution. Both socioeconomic status and 10th-grade test scores were related to college attainment (*Indicator 26*).

Curriculum

The courses students take in high school and college are an indirect indication of the content of students' knowledge. A greater percentage of 1992 than 1982 high school graduates earned the number of units in the core courses—4 units in English, and 3 each in science, social studies, and mathematics—recommended in *A Nation at Risk* (*Indicator 28*). In 1994, 51 percent of high school graduates had earned at least this number of credits in the core subjects, compared to 14 percent in 1982. Graduates in 1994 took more mathematics and science courses in high school than 1982 graduates, particularly geometry, algebra II, biology, and chemistry (*Indicator 29*).

Business management is the most popular major in college: 22 percent of all bachelor's degree recipients in 1993 majored in this subject area (*Indicator 41*). At the graduate level, males were still twice as likely as females to earn degrees in business, although the gap has narrowed significantly since the early 1970s (*Indicator 27, Condition 1995*). At least 60 percent of undergraduate students take courses in the arts, English literature, psychology, sociology/anthropology, history, physical science, and mathematics (*Indicator 28, Condition 1994*).

Trends in the mathematics proficiency of 9-, 13-, and 17-year-olds

- ◆ Average mathematics proficiency improved between 1978 and 1992 for all age groups.
- ◆ White, black, and Hispanic 9-year-olds showed large improvements in average mathematics proficiency between 1982 and 1992, after remaining stable between 1973 and 1982.
- ◆ Although a large gap in mathematics proficiency exists between whites and their black and Hispanic peers for all age groups at ages 13 and 17, white scores increased at a slower rate than black and Hispanic scores, causing this gap to decrease over the last 20 years.
- ◆ The percentage of 17-year-olds scoring at or above level 250 increased from 92 to 97 percent; those scoring at or above level 300 increased from 52 to 59 percent; but those scoring at or above level 350 stayed at 7 percent (see supplemental table 15-2).
- ◆ There is much variation in the mathematics proficiency scores of students. In 1992, scores for all three age groups varied by about 100–110 scale points between the 5th percentile and the 95th percentile. The amount of variation has decreased since 1978, however, when the difference between the top and the bottom 5 percent ranged from 109 to 129 scale points (see supplemental table 15-3).

Proficiency in mathematics is an important outcome of education. In an increasingly technological world, the mathematics skills of the nation's workers may be a crucial component of economic competitiveness. In addition, knowledge of mathematics is critical for success in science, computing, and a number of other related fields of study.

Average mathematics proficiency (scale score), by sex and age: Selected years 1973–92

Year	Total			Male			Female

¹ Statistically significant difference from 1992.

² Statistically significant difference from 1973.

NOTE: The mathematics proficiency scale ranges from 0 to 500. (See supplemental table 15-1 for detailed explanations of levels.)

Level 150: Simple arithmetic facts

Level 300: Moderately complex procedures and reasoning

Level 200: Beginning skills and understandings

Level 350: Multi-step problem solving and algebra

Level 250: Numerical operations and beginning problem solving

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, *Trends in Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992; Mathematics, 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.*

Average mathematics proficiency (scale score): Selected years 1978–92

NOTE: The mathematics proficiency scale ranges from 0 to 500.

SOURCE: U.S. Department of Education, National Center For Education Statistics, National Assessment of Educational Progress, *Trends In Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992; Mathematics, 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.*

Trends in the science proficiency of 9-, 13-, and 17-year-olds

- ◆ In 1992, average science achievement was higher at all three age levels than in 1982. In addition, the gap between male and female scores at ages 13 and 17 decreased during that period, but the gap increased at age 9.
- ◆ In 1992, the average science proficiency of blacks and Hispanics remained well below that of whites. However, between 1977 and 1992, the proficiency gap decreased between whites and blacks at age 9 and between whites and Hispanics at age 13.
- ◆ A higher percentage of 9-, 13-, and 17-year-olds demonstrated general science skills by reaching levels 200 and 250 in 1992 than did in 1982. In addition, more 17-year-olds reached levels 300 and 350 in 1992, exhibiting a greater understanding of science (see supplemental table 16-2).
- ◆ There is a great deal of variation in science proficiency scores within an age group. For example, the proficiency of white 9-year-olds varies by 120 scale points from the 5th percentile to the 95th percentile. By comparison, the difference in the median proficiency of white 9- and 17-year-olds is 66 scale points (see supplemental table 16-3).

Competence in science is an important outcome of education. The ability to apply scientific information, interpret data, and make inferences about scientific findings is useful in a world that relies heavily on technological and scientific advances.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, *Trends In Academic Progress: Achievement of U.S. Students in Science, 1969 to 1992; Mathematics, 1973 to 1992; Reading, 1971 to 1992; and Writing, 1984 to 1992, 1994.*

Average reading proficiency of 4th-, 8th-, and 12th-graders

- ◆ Overall, average reading proficiency for 4th- and 8th-grade students was similar in 1992 and 1994. Average proficiency scores for 12th-grade students, however, decreased during this period.
- ◆ Average reading proficiency increased as the number of different types* of reading materials at home increased. More than one-third of 4th-graders and one-half of 8th- and 12th-graders reported having each of four types of reading materials (books, newspapers, magazines, and encyclopedias) at home in 1994.
- ◆ Generally, the more students read for fun on their own time, the higher their reading scores were. Between 1992 and 1994, the percentage of 12th-graders who reported that they never or hardly ever read for fun increased from 24 to 27 percent.
- ◆ Students who read 11 or more pages each day for school and homework had higher average reading proficiency scores than those who read less than 5 pages a day. Between 1992 and 1994, the percentage of 12th-graders who read 11 pages or more each day decreased as did 12th-grade reading scores.
- ◆ Students who watched 3 or fewer hours of television a day showed higher levels of reading proficiency than those who watched 6 or more hours each day. In 1994, 57 percent of 4th-graders and 59 percent of 8th-graders watched 3 or fewer hours daily, while 75 percent of 12th-graders did so.

A student's ability to read is essential to the educational process and increases the likelihood that he or she will become a full participating member of society. Students' exposure to various types of reading materials at home, as well as students' habits outside of school, can play a critical role in their growth as readers.

Average reading proficiency (scale score), by grade and selected characteristics: 1992 and 1994

Selected characteristics	Grade 4				Grade 8				Grade 12

Average reading proficiency (scale score) and percentage of students with selected characteristics: 1992 and 1994

* Types of reading materials at home include books, newspapers, magazines, and encyclopedias.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, 1994 Reading Report Card for the Nation and the States, 1996.

Average U.S. history proficiency of 4th-, 8th-, and 12th-graders

- ◆ In 1994, average history proficiency scores of whites and Asians were higher than those of blacks and Hispanics in grades 4, 8, and 12. However, the difference between the average proficiency scores of white and black students and of white and Hispanic students was smaller in 8th and 12th grades than in 4th grade.
- ◆ In 1994, students at urban fringe schools had higher average history proficiencies than those in central city or rural schools at the 4th-grade and 8th-grade levels. However, in 12th grade, there were no measurable differences between the scores of students in urban fringe schools and those in central city schools—both outperformed students in rural schools (see supplemental table 17-2).
- ◆ Generally, students who spent more time watching television each day had lower average history proficiency scores. In both 4th and 8th grades, students who watched 3 or fewer hours of television per day scored higher than those who watched 4 or more hours of television per day. In 12th grade, even watching 1 hour of television per day was associated with lower average history proficiency scores, as those who watched 1 or less hour per day had higher average proficiency scores than did those who watched 2 or more hours per day (see supplemental table 17-3).
- ◆ There was a greater difference in the average history proficiencies between white students who scored in the top and bottom 10th percentile than between white students and black or Hispanic students who scored at the median. For example, in 1994, the difference between the 10th percentile and the 90th percentile of white 8th-graders was 73 points, while the difference between white and black 8th-graders who scored at the 50th percentile was 29 points, and the difference between white and Hispanic 8th-graders who scored at the 50th percentile was 24 points (see supplemental table 17-4).

A working knowledge of U.S. history—the country's struggles, successes, and failings—allows citizens to make informed and intelligent decisions about contemporary issues. There has recently been a renewed interest in the role of history in education, prompting The National Education Goals Panel to include history on its list of key subjects.

Average U.S. history proficiency (scale score), by sex, race/ethnicity, and grade: 1994

Sex and race/ethnicity	Grade 4		Grade 8		Grade 12	
	Percentage distribution	Average proficiency	Percentage distribution	Average proficiency	Percentage distribution	Average proficiency

Average geography proficiency of 4th-, 8th-, and 12th-graders

- ◆ Overall, males had higher geography proficiency scores than females across all three grade levels.
- ◆ At all three grade levels, white and Asian students outscored black and Hispanic students, and Hispanic students outscored black students.
- ◆ In 1994, 4th-grade students in the Central region outperformed those in the other three regions. At the 8th-grade level, students in the Northeast and Central regions had higher scores than those in the Southeast and the West. At the 12th-grade level, students in the Southeast had lower average scores than did those in each of the other regions.
- ◆ There is a strong positive relationship between average geography proficiency and parents' educational level. For example, 8th-grade students whose parents had a college degree scored an average of 7 scale points higher than those whose parents had some education after high school but did not graduate from college, 22 scale points higher than those whose parents had only a high school diploma and 34 scale points higher than those whose parents did not complete high school.

In order to be able to compete in today's global economy, students require not just a familiarity with globes, atlases, and maps, but also the knowledge to fully understand these items and the skills necessary to put that knowledge into practice. The geography assessment focuses on particular places on Earth, spatial patterns on the Earth's surface, and physical and human processes that shape such patterns; interactions between environment and society; and spatial variations and connections among people and places.

Average geography proficiency (scale score), by grade and selected characteristics: 1994

Selected characteristics	Grade 4		Grade 8		Grade 12	
	Percentage distribution	Average score	Percentage distribution	Average score	Percentage distribution	Average score

International comparisons of reading literacy

- ◆ In an international assessment of basic reading literacy, 9-year-olds from the United States performed better, on average, on the narrative domain than students from other large countries.
- ◆ At age 14, students in the United States scored higher, on average, on the expository domain than students of similar ages in Italy, West Germany, and Spain.
- ◆ There is far greater variation in the basic reading literacy of students within each country than there are differences in averages among countries. For example, among 9-year-olds, the difference between the 10th and the 90th percentile on the narrative domain was 235 scale points in the United States, compared to a difference of 62 scale points between the United States and West Germany (see supplemental table 20-2).
- ◆ Children whose home language is different from the one spoken at school showed lower literacy levels in most of the larger countries, including the United States, at both ages 9 and 14 than did those children whose home language was the same as that spoken at school.

The ability to read is a minimum requirement to participate productively in a global economy and to fulfill basic civic responsibilities. Comprehending written language and effectively using written language are crucial for both future learning and the development of basic job skills.

Average reading literacy (scale scores), by age and country: School year 1991–92

Spain	490	488	492	500	495	475	11	481	89	491

Table reads: In the 1991–92 school year, 9-year-olds from the United States had an average reading literacy scale score of 547, while 9-year-olds from France had an average reading literacy scale score of 531.

NOTE: In the Study of Reading Literacy, 32 countries assessed the reading achievement of students in the grades where most 9- and 14-year-olds were enrolled. The countries above are the larger countries. The above scores were scaled using the Rasch procedure. The domain scores for each age group were scaled to a mean of 500 and a standard deviation of 100. The average overall score is the mean of the domain scale scores. Some student groups were excluded by the participating countries, such as those in private schools, in schools serving disabled children, or in schools where the language of instruction is different from the primary national language.

SOURCE: International Association for the Evaluation of Educational Achievement, Study of Reading Literacy, *How in the World Do Students Read?*, 1992.

Distribution of scale scores on reading literacy assessment, by country: School year 1991–92

NOTE: The vertical lines at ability score 500 mark the average score for each age group for all participating countries. The standard deviation is 100.

SOURCE: International Association for the Evaluation of Educational Achievement, Study of Reading Literacy, *How In the World Do Students Read?*, 1992.

International comparisons of adult literacy

- ◆ Compared to most of the other countries assessed in 1994, the United States had a greater concentration of adults who scored at the lowest literacy levels across the prose, document, and quantitative literacy domains. However, the United States had one of the higher concentrations of adults who scored at or above level 4 on the prose scale.
- ◆ In 1994, the proportion of adults who scored at each literacy level was similar across the three scales in Canada and the United States. In Germany, the Netherlands, and Switzerland, on the other hand, the proportion of adults who scored at the highest literacy level (level 4/5) was greater on the quantitative scale than on the prose scale.
- ◆ The distribution of literacy proficiency across different age groups was fairly uniform in the United States, with the exception of the oldest age group, while in several other countries young adults had higher literacy levels than older adults. For example, the percentage of U.S. adults aged 26–35 who scored at or above level 4 on the prose scale was similar to the percentage of U.S. adults aged 46–55 scoring at that level (22 and 24 percent, respectively). Within Germany, the younger group was almost twice as likely to score at or above level 4 on the prose scale as the older group (20 and 11 percent, respectively). Differences by age in Switzerland, Sweden, and the Netherlands were similar to those in Germany (see supplemental table 21-2).
- ◆ Within particular occupations, the proportion of workers scoring at each literacy level varied across the assessed countries. For example, the proportion of skilled craft workers scoring at level 3 or above was lower in the United States than in other countries, particularly Germany (see supplemental table 21-3).

In recent years, literacy has been viewed as one of the fundamental tools necessary for successful economic performance in industrialized societies. Literacy is no longer defined merely as a basic threshold of reading ability, but rather as the ability to understand and use printed information in daily activities, at home, at work, and in the community. As society becomes more complex and low skill jobs continue to disappear, concern about adults' ability to use written information to function in society continues to increase. Within countries, literacy levels are affected by both the quality and quantity of the population's formal education, as well as their participation in informal learning activities.

Percentage distribution of the population in selected countries scoring at each of the five literacy levels, by literacy scale: 1994

Country	Prose scale				Document scale				Quantitative scale			
	Level 1	Level 2	Level 3	Level 4/5	Level 1	Level 2	Level 3	Level 4/5	Level 1	Level 2	Level 3	Level 4/5
Canada	16.6	25.6	35.1	22.7	18.2	24.7	32.1	25.1	16.9	26.1	34.8	22.2
Germany	14.4	34.2	38.0	13.4	9.0	32.7	39.5	18.9	6.7	26.6	43.2	23.5
Netherlands	10.5	30.1	44.1	15.3	10.1	25.7	44.2	20.0	10.3	25.5	44.3	19.9
Poland	42.6	34.5	19.8	3.1	45.4	30.7	18.0	5.8	39.1	30.1	23.9	6.8
Sweden	7.5	20.3	39.7	32.4	6.2	18.9	39.4	35.5	6.6	18.6	39.0	35.8
Switzerland (French)	17.6	33.7	38.6	10.0	16.2	28.8	38.9	16.0	12.9	24.5	42.2	20.4
Switzerland (German)	19.3	35.7	36.1	8.9	18.1	29.1	36.6	16.1	14.2	26.2	40.7	19.0
United States	20.7	25.9	32.4	21.1	23.7	25.9	31.4	19.0	21.0	25.3	31.3	22.5

Table reads: In 1994, 21.1 percent of the population in the United States scored at or above level 4 on the prose literacy scale. NOTE: The individuals who performed at level 1 demonstrated the lowest literacy proficiency, while those at level 5 displayed the highest literacy proficiency. See the supplemental note to this indicator for a description of the literacy scales and levels.

SOURCE: Organization for Economic Co-operation and Development and Statistics Canada, *Literacy, Economy and Society, Results of the International Adult Literacy Survey*, 1995.

Percentage distribution of the population in selected countries scoring at each of the five literacy levels, by literacy scale: 1994

NOTE: See the supplemental note to this indicator for a description of the literacy scales and levels.

Scholastic Assessment Test (SAT) scores

- ◆ Average total SAT scores rose 8 points between 1994 and 1995. Verbal scores rose 4 points for male and 5 points for female test-takers, and mathematics scores rose 2 points for male and 3 points for female test-takers.
- ◆ The percentage of high school graduates who took the SAT remained at about 42 percent during the 1992–95 period, up from 35 percent in 1984. The proportion of minority SAT test-takers more than doubled between 1976 and 1995, rising from 15 to 31 percent (see supplemental table 22-1).
- ◆ Overall, average scores for minority test-takers have improved over the past 20 years. Between 1976 and 1995, the average scores of black test-takers rose 24 points on the verbal section and 34 points on the mathematics section, while the average scores of whites fell 3 points on the verbal section and rose 5 points on the mathematics section (see supplemental table 22-2).
- ◆ Between 1991 and 1995, the percentage of graduating seniors taking the American College Testing (ACT) program increased 5 percentage points, while the percentage taking the SAT remained the same. While scores on the ACT remained about the same over this time period, scores on the SAT rose 14 points (see supplemental tables 22-1 and 22-7).

The Scholastic Assessment Test (SAT) is the test taken most frequently by college-bound students. It is designed to predict success in the freshman year of college, and to track the performance of groups of students who intend to enter college over time. When interpreting these scores, the reader should be aware that the proportion of high school graduates who take the exam changes over time.

Average SAT scores of college-bound seniors, by section and sex: 1972–95

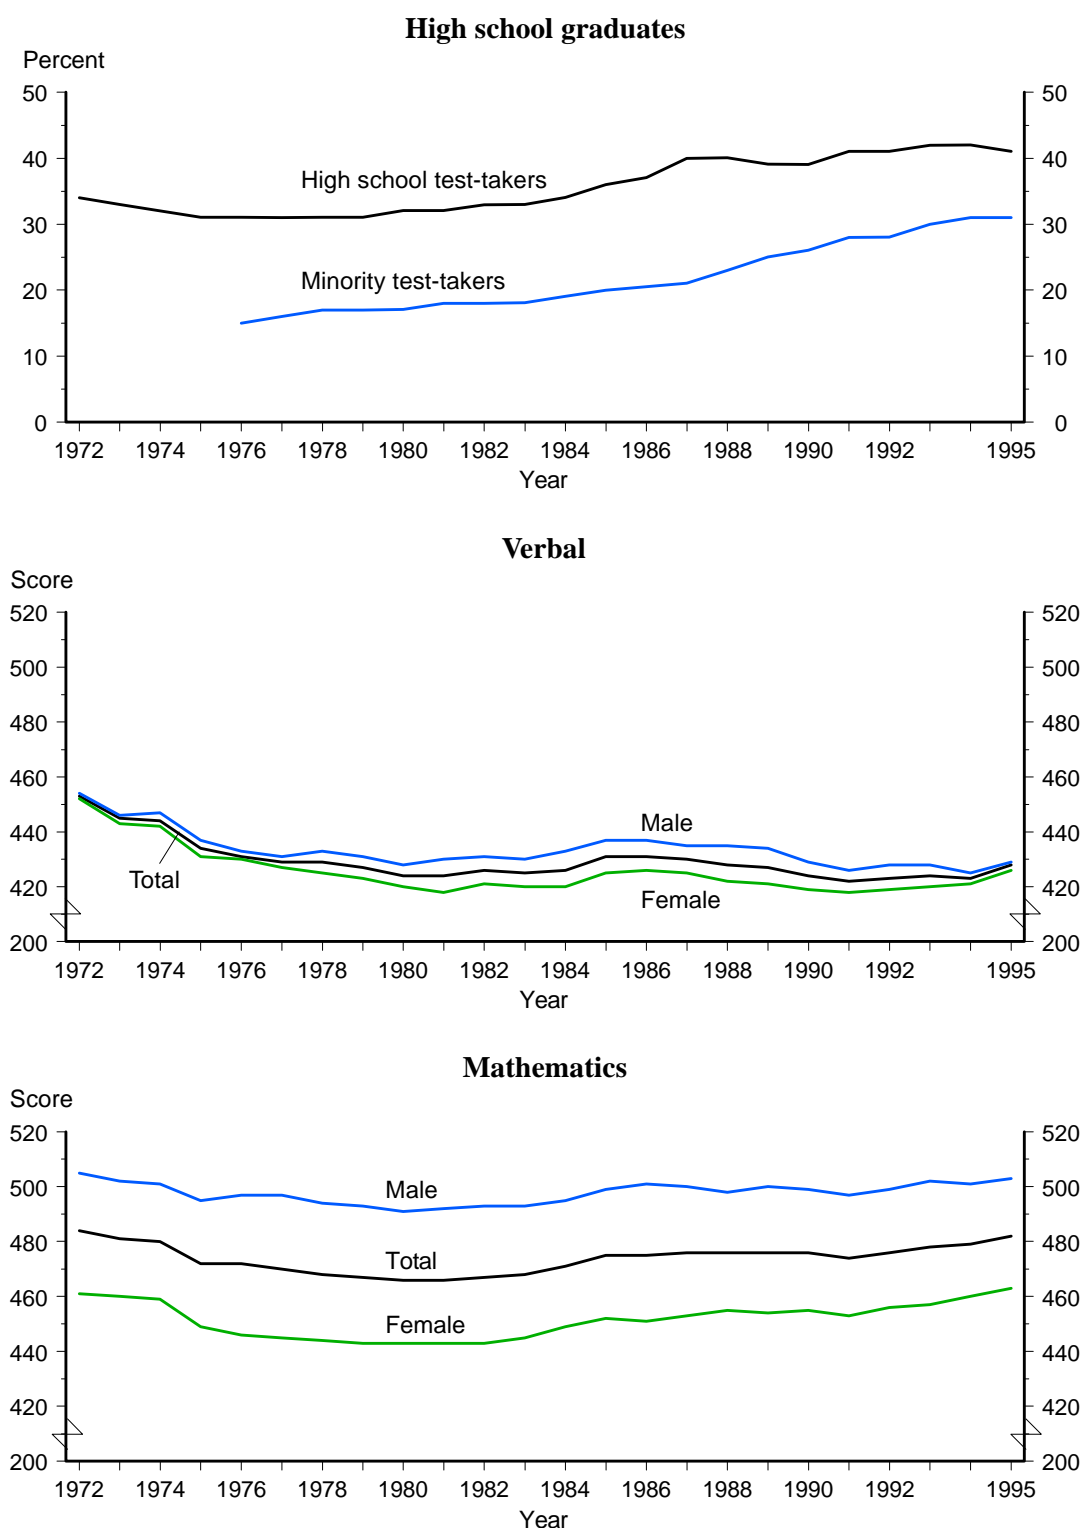

Year	Verbal			Mathematics			Combined		
	Total	Male	Female	Total	Male	Female	Total	Male	Female
1972	453	454	452	484	505	461	937	959	913
1973	445	446	443	481	502	460	926	948	903
1974	444	447	442	480	501	459	924	948	901
1975	434	437	431	472	495	449	906	932	880
1976	431	433	430	472	497	446	903	930	876
1977	429	431	427	470	497	445	899	928	872
1978	429	433	425	468	494	444	897	927	869
1979	427	431	423	467	493	443	894	924	866
1980	424	428	420	466	491	443	890	919	863
1981	424	430	418	466	492	443	890	922	861
1982	426	431	421	467	493	443	893	924	864
1983	425	430	420	468	493	445	893	923	865
1984	426	433	420	471	495	449	897	928	869
1985	431	437	425	475	499	452	906	936	877
1986	431	437	426	475	501	451	906	938	877
1987	430	435	425	476	500	453	906	935	878
1988	428	435	422	476	498	455	904	933	877
1989	427	434	421	476	500	454	903	934	875
1990	424	429	419	476	499	455	900	928	874
1991	422	426	418	474	497	453	896	923	871
1992	423	428	419	476	499	456	899	927	875
1993	424	428	420	478	502	457	902	930	877
1994	423	425	421	479	501	460	902	926	881
1995	428	429	426	482	503	463	910	932	889

Table reads: The average verbal SAT score for college-bound males in 1995 was 429, down from 454 in 1972.

NOTE: The term “college-bound seniors” refers to those students from each high school graduating class who participated in the College Board Admissions Testing Program, and does not include all first-year college students, or all high school seniors, as about one-third of high school graduates participate in the American College Testing (ACT) Program. ACT scores can be found in supplemental table 22-7. See the supplemental note to this indicator for information on interpreting SAT scores.

International comparisons of mathematics performance

- ◆ **In the second International Assessment of Educational Progress (IAEP), 9-year-old students from the United States scored lower, on average, in mathematics performance than 9-year-olds from five other large countries.**
- ◆ **Thirteen-year-olds from the United States scored lower, on average, than students of the same age in the other large countries, except Spain.**
- ◆ **Average mathematics proficiency among 13-year-old students in the United States was 48 scale points below that of their South Korean counterparts. This was more than half of the difference between 9- and 13-year-olds in the United States, suggesting that United States students at age 13 may be performing at levels similar to Korean students 2 to 3 years younger.**
- ◆ **There is far greater variation in the mathematics proficiency of students within each country than there are differences in averages among countries. For example, among 13-year-olds, the difference between the 10th and 90th percentile was 124 scale points in the United States, compared to a difference in average proficiency between the United States and Taiwan of 51 scale points.**

The technical skills of a nation's workers are a crucial component of its economic competitiveness. The youth of today will be tomorrow's workers and will be competing in the global marketplace. They will depend on the mathematics learned in this decade to succeed in the complex business and technological environments of the future.

Proficiency scores on mathematics assessment, by age and country: 1991

Larger countries ¹	Average proficiency score			Percentile score						
	Total	Male	Female	1st	5th	10th	Median	90th	95th	99th
Age 9

International comparisons of science performance

- ◆ **In the second International Assessment of Educational Progress (IAEP), 9-year-old students from South Korea scored higher, on average, in science performance than 9-year-olds from the United States. Students of the same age from Spain scored lower, on average.**
- ◆ **Thirteen-year-olds from South Korea, Taiwan, the former Soviet Union, and Canada scored higher, on average, than U.S. students of the same age.**
- ◆ **The difference in average science proficiency scores between 9- and 13-year-olds in the United States (75 scale points) was less than the proficiency difference in other large countries (ranging from 95 to 111 scale points).**
- ◆ **Among 9-year-olds, boys performed better than girls in South Korea, Taiwan, and Spain. At age 13, this gender difference held across all large participating countries except Taiwan.**

The scientific and technological skills of a nation's workers are a crucial component of its economic competitiveness. The youth of today will be tomorrow's workers and will be competing in the global marketplace. They will depend on the science learned in this decade to succeed in the complex business and technological environments of the future.

Educational attainment

- ◆ **Educational attainment of 25- to 29-year-olds increased between 1971 and 1995. The percentage of students completing high school rose 9 percentage points; the percentage of high school graduates completing at least some college rose 19 percentage points; and the percentage of high school graduates completing 4 or more years of college rose 6 percentage points.**
- ◆ **While fewer black 25- to 29-year-olds had completed high school than their white counterparts in 1995, the gap between the percentage of blacks and whites completing high school narrowed considerably between 1971 and 1995, decreasing from 23 to 6 percentage points. Fifty-two percent of black high school graduates had completed at least some college in 1995, compared to 65 percent of white high school graduates, and a smaller percentage of black than white high school graduates had completed a bachelor's degree or higher (18 compared to 31 percent).**
- ◆ **In 1995, fewer Hispanic 25- to 29-year-olds had completed high school than their white counterparts. Fifty percent of Hispanic high school graduates had completed at least some college and 16 percent had completed a bachelor's degree or higher, compared to 65 and 31 percent, respectively, of their white counterparts. These gaps in educational attainment between Hispanics and whites did not closed between 1971 and 1995.**

Changes in educational attainment over time indicate changes in the demand for skills and knowledge in the work force. Also, changes in educational attainment can reflect the increasing emphasis society places on graduating from high school and college: completing high school and college is an important educational accomplishment that yields many benefits to those who achieve it. Better job opportunities and higher earnings are examples of those benefits.

Percentage of 25- to 29-year-olds who have completed high school, and percentage of high school graduates who have completed 1 or more and 4 or more years of college, by race/ethnicity: Selected years March 1971–95
 race/ethnicity: Selected years March 1971–95

Postsecondary education enrollments and completions of the class of 1982

- ◆ Among 1980 sophomores who scored in the highest test quartile in 12th grade in 1982, high socioeconomic status (SES) students were much more likely than low SES students to enroll in a 4-year institution first (78 compared to 49 percent). Low SES students in the highest test quartile were more likely than high SES students to start at a public 2-year institution or not to enroll at all by 1992.
- ◆ Among the 1980 sophomore cohort in the highest test quartile in 12th grade, high SES students were much more likely than low SES students to have earned a bachelor's or advanced degree by 1992. Forty-three percent of low SES students who were in the highest test quartile in 12th grade in 1982 had not earned any postsecondary certificate or degree.
- ◆ The way in which young people started their postsecondary education and their level of attainment 10 years later were highly related. Those who enrolled full time in 4-year institutions immediately after high school were much more likely to have completed a bachelor's degree than were students who enrolled part time immediately or who delayed their entry (see supplemental table 26-2).

Many young people pursue postsecondary education in the first few years after high school. Postsecondary education is the key to many of the subsequent transitions and achievements these young people make, including entering the labor force, establishing careers and career goals, and forming a family. Higher levels of educational attainment are strongly correlated with more stable patterns of employment and higher earnings. The numbers of students enrolling in postsecondary education and completing a certificate or degree are indicators of access to these benefits.

Percentage distribution of 1980 high school sophomores according to type of postsecondary institution first attended, by 1982 test quartile and socioeconomic status: 1992

Socioeconomic status	Low test quartile				Middle test quartiles				High test quartile			
	4-year	2-year	Other	Never attended	4-year	2-year	Other	attended	4-year	2-year	Other	Never attended
Total	8.4	17.9	14.8	58.8	23.4	30.6	14.3	31.6	66.9	19.5	7.3	6.4
Low quartile	6.8	13.5	14.9	64.8	13.7	24.4	16.1	45.8	48.5	27.5	9.1	14.9
Middle quartiles	10.2	23.1	13.0	53.7	22.1	32.6	14.9	30.5	59.0	23.9	8.5	8.6
High quartile	12.9	24.1	19.0	44.0	41.5	33.4	10.6	14.6	77.9	13.7	5.8	2.5

Table reads: Of 1980 high school sophomores in the low test quartile in 1982, 8.4 percent attended a 4-year institution first.

Percentage distribution of 1980 high school sophomores according to highest degree earned, by 1982 test quartile and socioeconomic status: 1992

Socioeconomic status	Low test quartile				Middle test quartiles				High test quartile			
	High school or less	Certif-icate/ assoc.	Bach-elors	Ad-vanced	High school or less	Certif-icate/ assoc.	Bach-elors	Ad-vanced	High school or less	Certif-icate/ assoc.	Bach-elors	Ad-vanced
Total	79.6	17.1	3.0	0.3	59.2	22.8	16.1	1.9	26.6	11.9	49.2	12.3
Low quartile	82.4	15.1	2.1	0.4	70.4	21.9	7.1	0.6	43.1	25.3	25.6	6.1
Middle quartiles	78.6	17.7	3.5	0.2	58.6	24.3	15.4	1.7	33.9	14.3	44.0	7.8
High quartile	69.3	21.4	9.1	0.2	44.5	19.7	31.6	4.2	17.6	7.7	57.2	17.5

Table reads: Of 1980 high school sophomores in the low test quartile in 1982, 79.6 percent had attained no more than a high school diploma by 1992.

NOTE: Composite test scores are based on the average nonmissing scores on reading, vocabulary, and mathematics (part I) tests.

International comparisons of educational attainment, by age

- ◆ **The educational attainment of the U.S. population in 1992 was high compared to other large industrialized countries. A similar or higher percentage of 25- to 64-year-olds in the United States had completed secondary and higher education than their counterparts in Japan, Germany, the United Kingdom, France, Italy, or Canada.**
- ◆ **In Japan, Germany, the United Kingdom, and Canada, 25- to 34-year-olds had completed secondary education at rates similar to their counterparts in the United States.**
- ◆ **Young males aged 25–34 in Japan were much more likely to complete higher education than males of the same age group in the other large industrialized countries. Young males in the United States ranked second.**
- ◆ **Young females aged 25–34 in the United States were much more likely to complete higher education than females and males of the same age in other large industrialized countries (with the exception of young males in Japan).**

The percentage of the population completing secondary and higher education in the United States and other highly industrialized countries provides an indication of the skill level of the U.S. work force as compared to its economic competitors. Furthermore, contrasting the educational attainment of the general population to the attainment of younger age cohorts provides a means of comparing past and recent progress in the rate at which individuals complete high school or college.

Percentage of the population in large industrialized countries who have completed secondary and higher education, by age, sex, and country: 1992

Country	25–64 years old		25–34 years old					
	Both sexes		Both sexes		Male		Female	
	Secondary education	Higher education	Secondary education	Higher education	Secondary education	Higher education	Secondary education	Higher education
Canada	71.3	15.0	80.8	16.1	79.0	16.0	82.5	16.2
France	52.2	10.2	67.1	12.3	68.4	12.4	65.7	12.1
Germany	81.9	11.6	88.6	11.8	90.9	13.0	86.3	10.5
Italy	28.4	6.4	42.4	6.8	41.5	6.8	43.3	6.7
Japan*	69.7	13.3	90.6	22.9	89.3	34.2	91.8	11.5
United Kingdom	68.1	10.7	80.9	12.5	82.2	14.3	79.6	10.7
United States	84.0	23.6	86.5	23.2	85.9	23.3	87.0	23.1

Table reads: In 1992, 84.0 percent of those aged 25–64 in the United States and 81.9 percent of those of similar age in Germany had completed secondary education.

* Data are for 1989.

NOTE: In the United States, completing secondary education is defined as graduating from high school or earning a GED; completing higher education is defined as earning a bachelor's degree or more.

SOURCE: Organization for Economic Co-operation and Development, Indicators of Education's Systems, *OECD Education Statistics 1985–1992*.

Percentage of the population in large industrialized countries who have completed secondary and higher education, by age, sex, and country: 1992

High school course taking in the core subject areas

- ◆ **Between 1982 and 1994, the percentage of high school graduates earning the less restrictive number of units in core courses more than doubled, while those earning the "New Basics" units more than tripled. These increases occurred for both sexes and all racial/ethnic groups.**
- ◆ **Students enrolled in both academic and vocational programs were just as likely as students enrolled solely in an academic program to fulfill the less restrictive requirements. However, students enrolled in an academic program only were more likely to meet the more restrictive "New Basics" requirements than those in both programs.**
- ◆ **For private school graduates, the percentage fulfilling the "New Basics" requirements increased 39 percentage points between 1982 and 1994, compared to an increase of 37 percentage points for public school graduates. While the increase was smaller for private school graduates (32 percentage points) than for public school graduates (44 percentage points), a greater proportion of private school students (80 percent) earned the less restrictive number of units in 1994 than public school students (73 percent) (see supplemental table 28-1).**

In 1983, A Nation at Risk recommended that all students seeking a diploma be required to enroll in the "New Basics," a core curriculum composed of 4 years of English and 3 years each of social studies, science, and mathematics.¹ While several states have adopted this set of requirements, others have chosen a less restrictive set that requires 4 years of English, 3 years of social studies, and 2 years each of science and mathematics.

Percentage of high school graduates earning the minimum number of units in core courses, by type of curriculum and selected characteristics: 1982, 1987, 1990, and 1994

Characteristics	"New Basics" curriculum ¹				Less restrictive curriculum			
	1982	1987	1990	1994	1982	1987	1990	1994
Total	14.0	28.3	39.6	50.6	31.4	53.6	66.2	73.8
Sex								
Male	14.8	29.0	40.0	48.4	31.3	53.0	65.3	71.3
Female	13.3	27.6	39.2	52.6	31.5	54.2	67.1	76.3
Race/ethnicity								
White	15.5	29.3	40.6	53.6	32.4	53.0	65.6	75.0
Black	11.5	24.1	41.5	44.7	31.3	55.3	72.6	74.9
Hispanic	6.7	16.8	30.4	43.8	25.3	47.6	63.6	76.1
Asian/Pacific Islander	21.3	45.6	48.7	56.6	34.6	67.1	70.2	73.5
American Indian/Alaskan Native	6.5	24.6	21.6	43.6	35.3	62.1	49.9	73.0
Student program ²								
Academic	30.6	47.6	56.3	63.3	56.3	72.8	81.3	83.1
Vocational	0.0	0.0	0.0	0.0	5.4	13.5	14.3	20.2
Both	18.6	26.2	35.6	47.3	56.9	71.0	78.2	82.4
Neither	0.0	0.0	0.0	0.0	5.3	12.7	14.5	14.7

Table reads: 14.8 percent of 1982 male high school graduates earned the minimum number of units in core courses under the "New Basics" curriculum, and 31.3 percent earned the minimum under the less restrictive curriculum.

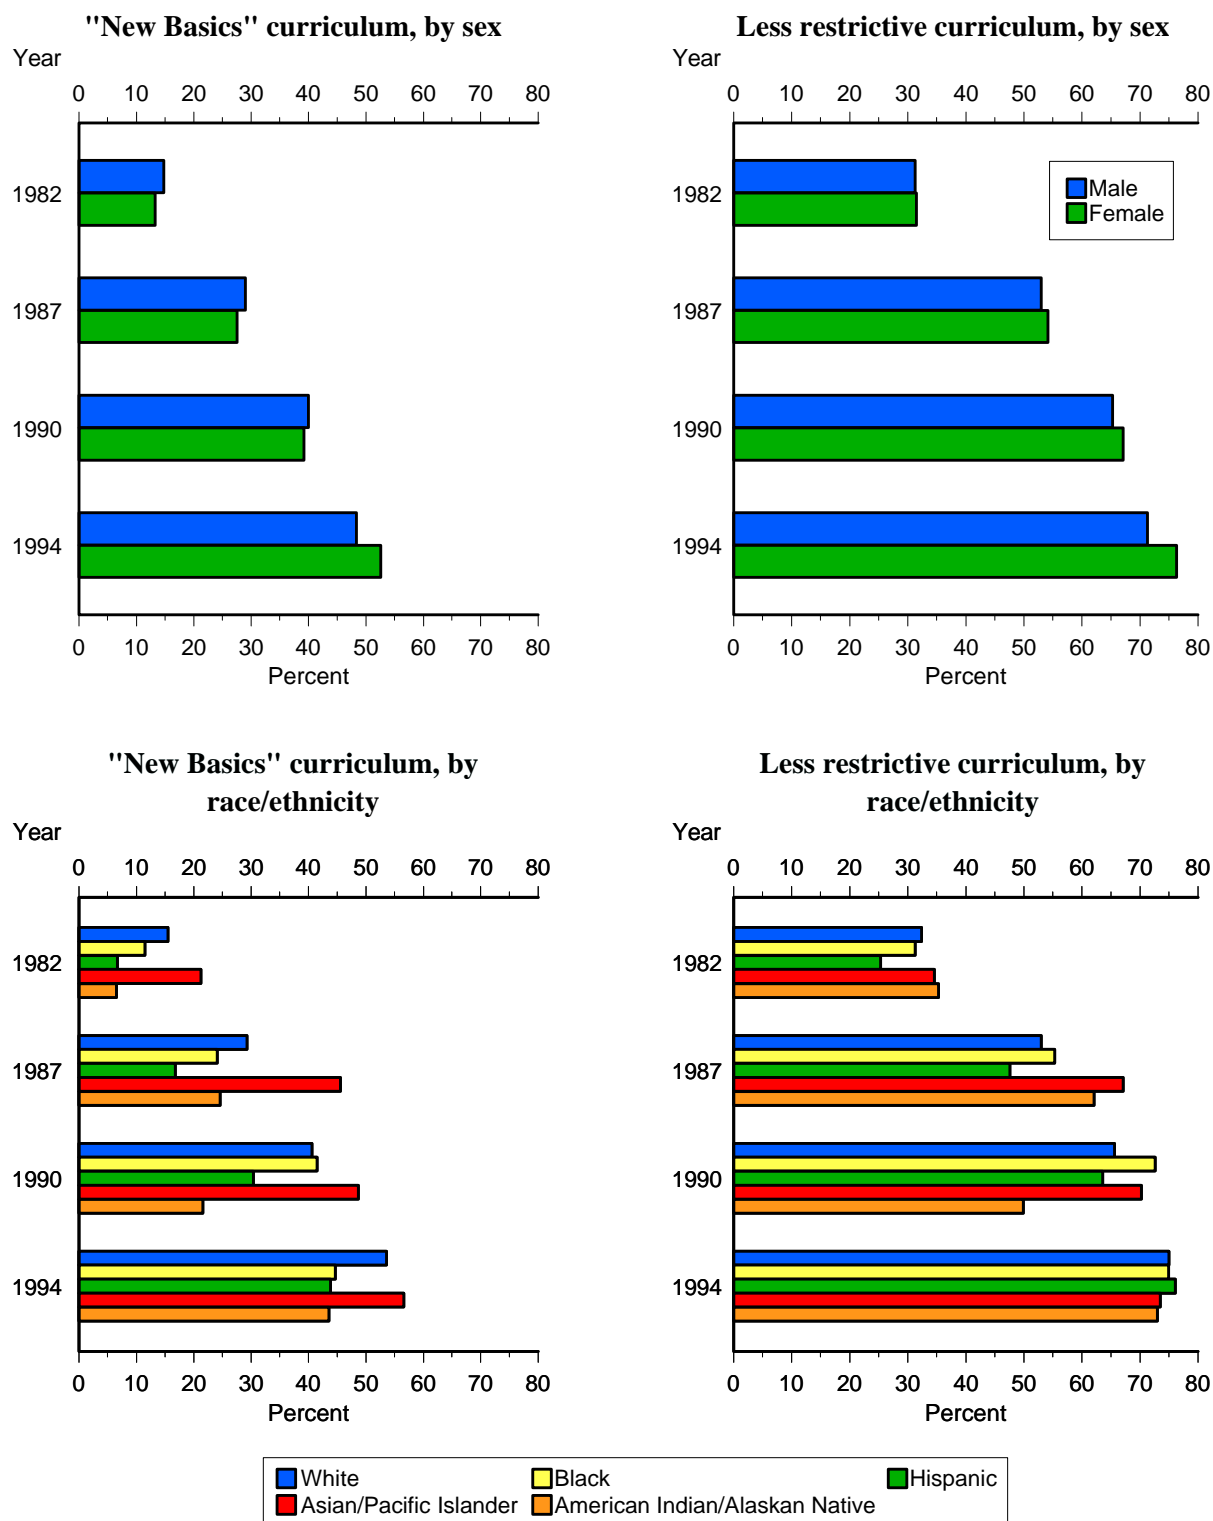

¹ The "New Basics" curriculum also includes 0.5 units of computer science which was not included in this analysis.

² To be placed in the "Academic" category, a student must have earned at least 12 credits in the core courses and not have met the "Vocational" category requirements. To be placed in the "Vocational" category, a student must have earned at least three credits in a single occupationally specific vocational education area but not have met the course credit requirements for the academic category. "Both" means the student met the requirements for both the academic and vocational programs. "Neither" means the student did not meet the requirements for either the academic or the vocational programs.

NOTE: For a description of the sampling procedures and related issues for the High School and Beyond (HS&B) Transcript Study and the later transcript studies, see the supplemental note to this indicator.

Percentage of high school graduates earning a minimum number of units in core courses, by type of curriculum, sex, and race/ethnicity: 1982, 1987, 1990, 1994

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The 1994 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1994, 1990, 1987, and 1982 High School Graduates*, 1996.

High school mathematics and science course-taking patterns

- ◆ **High school graduates in 1994 were more likely to take mathematics courses at the level of algebra I or higher and science courses at the level of biology or higher than their counterparts in 1982.**
- ◆ **The proportion of high school graduates who took algebra II and the proportion who took chemistry increased 7 percentage points between 1990 and 1994 and increased over 25 percentage points between 1982 and 1994 (to 59 and 56 percent, respectively).**
- ◆ **A larger percentage of 1994 graduates, both male and female, earned credit in biology, chemistry, and physics than their 1982 counterparts. Similar percentages of males and females earned credit in biology in both years. Females were more likely to earn credit in chemistry in 1994. Males were consistently more likely to earn credit in physics.**
- ◆ **The percentage of Hispanics and American Indians/Alaskan Natives taking algebra II more than doubled between 1982 and 1994, rising from 18 percent for Hispanics and from 11 percent for American Indians in 1982 to 51 percent for Hispanics and 39 percent for American Indians/Alaskan Natives in 1994 (see supplemental table 29-2).**

Courses in mathematics and science can teach students to use higher level thinking skills to solve complex problems. These skills are considered valuable both in educational and marketplace settings. Analysis of course-taking patterns of high school graduates can indicate levels of exposure in these fields for individuals who are about to advance to higher education or to enter the work force.

Percentage of high school graduates taking selected mathematics and science courses in high school, by sex: 1982, 1987, 1990, and 1994

Mathematics and science courses ¹	Total				Male				Female			
	1982 ²	1987 ²	1990 ²	1994	1982 ²	1987 ²	1990 ²	1994	1982 ²	1987 ²	1990 ²	1994

Table reads: In 1994, 70.4 percent of high school graduates had taken geometry in high school.

¹ The minimum number of units used for inclusion in this indicator was 1.00 for individual courses except for algebra II, trigonometry, and analysis/pre-calculus where 0.5 was set as the minimum number of credits.

² Numbers have been revised from previously published figures. See the supplemental note to *Indicator 28* for further explanation.

³ These data only report the percentage of students who earned credit in mathematics courses while in high school and do not count those students who took these courses prior to entering high school. In 1992, for example, approximately 93 percent of students had taken algebra I at any time prior to graduating from high school, and about 70 percent had taken geometry.

NOTE: See the supplemental note to *Indicator 28* for further explanation of courses and definitions.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The 1994 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1994, 1990, 1987, and 1982 High School Graduates*, 1996.

Economic and Other Outcomes of Education

Education is an investment in human skills. Like all investments, it involves both costs and returns. The cost of finishing high school to the student is quite low, because it consists mainly of the relatively low wages earned by a 16- to 19-year-old dropout. The cost to the student of attending college is higher, and principally includes tuition, books, fees, and the earnings given up by not working or by working part time in college. The returns come in many forms. Some are monetary, while others are personal, social, cultural, and economic. Some are directly related to the labor market, while others are not. Some accrue to the individual, others to society and the nation in general. Returns related to the labor market include better job opportunities, jobs that are less sensitive to general economic conditions, opportunities to participate in employer-provided training, and higher earnings. Other returns that are not related to the labor market but are often attributed to education include lower rates of welfare dependency (*Indicator 36*) and a greater interest and participation in civic affairs such as voting (*Indicator 37*).

The costs and returns of investing in postsecondary education have changed over time,* which affects the incentive for individuals to participate. Measures presented in this section illuminate changes in the rewards of finishing high school (or conversely, the penalties of not finishing) and changes in the rewards of investing in postsecondary education.

Penalties of not graduating from high school

These indicators suggest some general conclusions regarding the labor market penalties of not finishing high school. The immediate difficulty of making the transition from full-time school attendance to full-time work appears much greater for those who leave school before finishing high school. Without prior job experience or specialized training, school leavers may have difficulty finding jobs that they are willing to take. In October 1994, 64 percent of recent high school graduates not enrolled in college were employed, compared to 43 percent of recent school dropouts. The degree of advantage varied by race/ethnicity: 38 percent of recent black school graduates not enrolled in college and 34 percent of black school dropouts were employed in October 1994. Among whites, the corresponding percentages were 73 percent and 52 percent. White

school dropouts were more likely to be employed than black school graduates (*Indicator 30*).

As individuals enter their 20s and early 30s, some of the problems of making the transition from school to the work force are solved, but the advantage of a high school diploma persists. For example, among males aged 25–34 in March 1995, the employment rate for those with 9–11 years of school was 72 percent, compared to 87 percent for high school graduates. Among females 25–34 years old, less than half (46 percent) of high school dropouts were employed, compared to 67 percent of those with a diploma (*Indicator 32*).

Continuity of employment enables workers to become more productive as they gain specific job experience. This is an advantage both to the employer and the worker to the extent that this experience is reflected in wages. The employment advantages associated with finishing high school include a greater likelihood of full-time, year-round employment. While 74 percent of males and 57 percent of females aged 25–34 whose highest education level was high school worked full time, year round in 1994, 58 percent of males and 41 percent of females without a high school diploma did so (*Indicator 33*).

Among workers aged 25–34, those with 9–11 years of school earned substantially less than those who had completed high school. In 1994, for example, the median annual salary of males with 9–11 years of school was 68 percent of the median salary of high school graduates. The median annual salary of female high school dropouts was 58 percent of that of female high school graduates (*Indicator 34*).

Rewards of college attendance and graduation

The ratio of the median annual earnings of those who attend and graduate from college to the median annual earnings of high school graduates provides an indication of the financial returns of attending and graduating from college. In 1994, for males aged 25–34, the earnings premium for attending college and earning a bachelor's degree was 52 percent, and the earnings premium for attending college without attaining a bachelor's degree was 14 percent. For females in the same age group, the 1994 premium for attending and earning a bachelor's degree was even larger—86 percent,

while the premium for attending without attaining a bachelor's degree was 20 percent (*Indicator 34*).

While both males and females who persist in their education have substantial earnings advantages compared to school dropouts, there are persistent earnings differences between males and females with the same educational attainment. Among full-time, year-round workers, males at each education level earned more than females. For college graduates, the median male income in 1994 was \$36,100 compared to \$29,600 for females. The size of this gap in constant dollars has declined since 1970, when males who had a college degree and who worked full time, year round earned \$43,900 and females earned \$31,400 (table 34-4).

When students decide what to study in college, they often think about the possibilities of obtaining a job related to their major, and the earnings potential associated with these jobs. About three-fourths (78 percent) of 1992–93 graduates reported having a job related to their major in April 1994, and a similar proportion (76 percent) reported their jobs had career potential (*Indicator 31*). The median starting salary for 1992–93 graduates working full time and not enrolled in school was \$23,000. Graduates who majored in computer sciences and engineering have higher starting salaries than graduates who majored in all other fields of study, while students who majored in the humanities, social sciences, and education have the lowest starting salaries (*Indicator 35*).

Some of the salary difference between male and female college graduates may be accounted for by different majors chosen by members of each sex, and also by differential involvement in the labor market. Females were more likely than males to major in education, and males were more likely to major in computer sciences and engineering. Nevertheless, among college graduates whose majors were business and management, social and behavioral sciences, and natural sciences, who were working full time and were not enrolled in school, females earned less than males (*Indicator 35*).

Welfare reciprocity

The benefits of education to the individual include a higher income and a greater likelihood of employment. To the nation, these benefits correspond to a larger, more productive work force.

Among those aged 25–34 who went beyond 8th grade, higher education levels also correspond to lower rates of welfare reciprocity. For instance, in 1994, 14 percent of those in that age group with 9–11 years of school received income from AFDC or public assistance, while 6 percent of high school graduates received such income. Among black 25–to 34-year olds, the contrast is even more striking—30 percent of those with 9–11 years of school received welfare income in 1994, compared to 13 percent of high school graduates (*Indicator 36*).

Voting

Education plays a vital role in preparing individuals for active participation in the political, economic, and social lives of their communities. One of the key civic activities associated with education is participation in elections.

There is a strong positive relationship between voting in congressional and presidential elections and education. As educational attainment increases, so does voting participation. About 13 percent of 25- to 44-year olds with 1–3 years of high school voted in the 1994 congressional elections, compared to 31 percent of those with 4 years of high school, 46 percent of those with 1–3 years of college, and 57 percent of those with 4 or more years of college. Reported participation in the presidential election of 1992 by educational attainment was higher. For example, while 27 percent of those with 1–3 years of high school voted, 79 percent of those with 4 or more years of college did so. Differences in voting behavior by educational attainment have generally widened over time (*Indicator 37*).

There are several factors that may influence this relationship. Persons with higher educational attainment may have a greater sense of the efficacy of their vote than persons with less education, and may better understand how to use their vote to influence the political process. In addition, since higher educational attainment is associated with higher earnings, the more educated may be more concerned with the outcomes of the political process as they affect their material well being. Regardless of the explanation, the differences among educational groups in voting participation have generally widened over time (*Indicator 37*).

Transition from high school to work

- ◆ In 1994, 64 percent of recent high school graduates not enrolled in college were employed, compared to 43 percent of recent school dropouts.
- ◆ During the period of economic recession between 1989 and 1992, the employment rates in both groups fell about 10 percentage points. However, in 1993, the employment rate for recent school dropouts increased markedly, rising more than 10 percentage points.
- ◆ Nearly every year between 1972 and 1994, white recent school dropouts were more likely to be employed than black recent high school graduates not enrolled in college. In fact, in 1994, the employment rate for white recent school dropouts was 52 percent, while the employment rate for black recent high school graduates not enrolled in college was 38 percent.
- ◆ Between 1960 and 1994, male recent high school graduates not enrolled in college and recent school dropouts were more likely than their female counterparts to be employed (see supplemental table 30-1).

The transition from high school to work can be difficult. Without prior job experience or specialized training, school leavers may find it difficult to find jobs they are willing to take. The employment rate among school leavers, both those who have not finished high school and those who have finished but have not gone on to college, indicates the ease of making this transition.

Employment rates for recent high school graduates not enrolled in college and for recent school dropouts, by race/ethnicity: October 1972–94

October	Recent high school graduates not enrolled in college				Recent school dropouts			
	Total	White	Black	Hispanic	Total	White	Black	Hispanic

Table reads: In 1994, 64.2 percent of recent high school graduates who were not enrolled in college were employed.

* Too few sample observations for a reliable estimate.

NOTE: Recent high school graduates are individuals aged 16–24 who graduated during the survey year. Recent school dropouts are individuals aged 16–24 who did not graduate and who were in school 12 months earlier, but who were not enrolled during the survey month. Due to a change in data sources for this analysis, some percentages are revised from previously published figures.

Transition from college to work

- ◆ **In April 1994, two-thirds (67 percent) of recent college graduates were employed full time and were not enrolled in postsecondary education; 9 percent were employed part time and were not enrolled. About three-fourths (76 percent) of those who worked full time and who were not enrolled had jobs with career potential.**
- ◆ **Although about three-fourths of recent graduates who were working full time and not enrolled reported their jobs were related to their field of study, only 60 percent reported a college degree was required to get their job.**
- ◆ **There were no measurable differences among the percentages of recent graduates who were unemployed by field of study (see supplemental table 31-1).**
- ◆ **Females who majored in seven fields of study (business and management, public affairs/social services, biological sciences, mathematics and science, social sciences, humanities, and “other” majors) were more likely than males to work in the traditionally female occupations of administrative and clerical support (see supplemental table 31-1).**

The attainment of a bachelor's degree is one measure of the skills learned through college attendance. In recent years, concern about the difficulties encountered by recent graduates in making the transition from college to work has grown. Students, their families, and educational policymakers are interested in graduates' employment prospects and their relationship to fields of study.

Percentage of 1992–93 college graduates according to employment and enrollment status and relatedness of jobs to education, by selected characteristics: April 1994

Selected characteristics	Employment and enrollment status					Relatedness of job to education ¹		
	Employed full time, not enrolled	Employed part time, not enrolled	In labor force, enrolled ²	Not in labor force, enrolled	Not employed, not enrolled ³	Job related to field of study	Job required college degree	Job had career potential

Percentage of 1992–93 college graduates working full time and not enrolled in postsecondary education whose job was related to their field of study, and the percentage of those whose job required a college degree: April 1994

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1993 Baccalaureate and Beyond Longitudinal Study, First Follow-up (B&B:93/94).

Employment of young adults

- ◆ **Generally, the percentage of 25- to 34-year-olds who were employed was higher among those individuals with more education. In 1995, male and female college graduates aged 25–34 were much more likely to be employed than their counterparts who did not finish high school.**
- ◆ **The gap between the percentage of male and female college graduates aged 25–34 who were employed narrowed between 1971 and 1995, decreasing from 36 percentage points in 1971 to 10 percentage points in 1995.**
- ◆ **In 1995, the percentage of females aged 25–34 who were employed was higher than in 1971, regardless of their educational level. However, the percentage of females with a high school diploma or higher who were employed increased at a faster rate than did the percentage of females with only some high school.**

The percentage of a population group with jobs is influenced by a variety of factors. Some factors influence the willingness of employers to offer jobs to individuals with different levels of education at the going wage rate, while others influence the willingness of these individuals to take jobs at the going wage rate. The higher the proportion of young adults who are employed, the better are their labor market opportunities relative to other things they could do, and vice versa.

Percentage of 25- to 34-year-olds who were employed, by sex and years of school completed:
Selected years March 1971–95

March	Male				Female

Weeks and hours worked, by educational attainment

- ◆ In 1994, 82 percent of males and 66 percent of females aged 25–34 in the work force with bachelor’s degrees worked full time, year round, compared to 58 percent of males and 41 percent of females who had not completed high school.
- ◆ Males who had not completed high school were more likely to work part year (fewer than 50 weeks) than those who had a bachelor’s degree (35 compared to 15 percent) and to do so involuntarily (72 compared to 43 percent). Females who had not completed high school were also more likely to work part year than those who had a bachelor’s degree (44 compared to 25 percent), but not more likely to do so involuntarily (35 and 29 percent, respectively).

Individuals who complete higher levels of education, on average, have higher earnings, better benefits, and more satisfying work. One important determinant of these outcomes is steady work. Steady work generally brings valuable job experience and skills and, ultimately, more rewarding work. Without steady work, an individual’s labor market opportunities are likely to worsen over time.

Percentage distribution of 25- to 34-year-olds in the work force and, of those not employed full time and year round, the percentage for whom that status was involuntary,¹ by work status, sex, and educational attainment: 1994

Sex and educational attainment	Work status				Status involuntary ¹		
	Year-round, primarily full-time worker	Primarily part-time worker	Part-year worker	Non-worker ²	Of part-time workers	Of part-year workers	Of non-workers
Total	67.1	14.1	24.9	2.1	26.3	48.7	64.4
Sex							
Male	74.5	7.4	20.8	1.6	42.1	65.9	85.5

Some college, no degree	55.7	26.1	31.5	1.9	17.6	32.1	43.5
Associate’s degree	63.3	20.1	24.3	1.8	19.1	38.1	—
Bachelor’s degree	65.9	18.1	25.0	1.0	13.2	28.9	—
Advanced degree	64.4	14.4	30.3	0.7	17.1	29.6	—

— Too few sample observations for a reliable estimate.

¹ “Involuntary” includes as the main reason for not working either full time or year round: the inability to find full-time work, a shortage of work/materials, illness, or disability. Those whose reasons were “other” are not included in this analysis.

² Includes those who did not work but who looked for work at least 1 week during the calendar year.

NOTE: The first four columns of the table do not add to 100 percent because part-time and part-year workers may overlap.

Annual earnings of young adults

- ◆ **In 1994, the median annual earnings of young adults aged 25–34 who had not completed high school were substantially lower than those of their counterparts who had completed high school (32 and 42 percent* lower for males and females, respectively). Young adults who had completed a bachelor’s degree or higher earned substantially more than those who had only completed high school (52 and 86 percent* more for males and females, respectively).**
- ◆ **Between 1974 and 1994, the earnings advantage of obtaining a bachelor’s degree or higher increased dramatically for males (rising from 14 to 52 percent).**
- ◆ **Since 1970, the earnings advantage for 25- to 34-year-olds with some college or a bachelor’s degree or higher was generally greater for females than for males.**

Wages and salaries are influenced by many factors, including the employer's perception of the productivity and availability of workers with different levels of education and the economic conditions in the industries that typically employ workers with different levels of education. Annual earnings are influenced by the number of weeks worked in a year and the usual hours worked each week. The ratio of annual earnings of high school dropouts or college graduates to those of high school graduates is affected by all of these factors; it is a measure of the earnings disadvantage of not finishing high school and the earnings advantage of completing college.

Ratio* of median annual earnings of wage and salary workers aged 25–34 whose highest education level was grades 9–11, some college, or a bachelor’s degree or higher to those with a high school diploma, by sex: Selected years 1970–94

Year	Grades 9–11		Some college		Bachelor's degree or higher	
	Male	Female	Male	Female	Male	Female
1970	0.84	0.69	1.10	1.19	1.24	1.68
1972	0.80	0.70	1.04	1.16	1.19	1.63
1974	0.81	0.62	1.02	1.19	1.14	1.74
1976	0.78	0.61	1.03	1.14	1.19	1.58
1978	0.77	0.54	1.05	1.17	1.18	1.55
1980	0.73	0.65	1.04	1.24	1.19	1.52
1982	0.71	0.66	1.12	1.21	1.34	1.63
1984	0.63	0.56	1.15	1.21	1.36	1.61
1986	0.69	0.65	1.18	1.21	1.50	1.78
1988	0.68	0.56	1.10	1.31	1.42	1.81
1990	0.71	0.58	1.14	1.34	1.48	1.92
1991	0.64	0.64	1.14	1.32	1.53	1.90
1992	0.68	0.76	1.13	1.34	1.60	2.00
1993	0.67	0.59	1.12	1.31	1.57	1.99
1994	0.68	0.58	1.14	1.20	1.52	1.86

Table reads: In 1994, the median annual earnings for males whose highest education level was grades 9–11 were 68 percent of the median annual earnings of males who had a high school diploma.

* This ratio is most useful when compared to 1.0. For example, the ratio of 1.52 in 1994 for males whose highest education level was a bachelor’s degree or higher means that they earned 52 percent more than males who had a high school diploma. The ratio of 0.68 in 1994 for males whose highest education level was grades 9–11 means that they earned 32 percent less than males who had a high school diploma.

NOTE: In 1992, the Current Population Survey (CPS), which collected earnings for calendar year 1991, changed the questions used to obtain educational attainment of respondents. The category "Grades 9–11" now includes some who completed 12th grade but who have not received a high school diploma; "High school diploma" includes those who have an equivalency certificate; "Some college" includes those with an associate’s degree or vocational certificate; and "Bachelor’s degree or higher" includes those with an advanced degree. See the supplemental note to *Indicator 25* for further discussion.

SOURCE: U.S. Department of Commerce, Bureau of the Census, March Current Population Surveys.

Ratio* of median annual earnings of wage and salary workers aged 25–34 whose highest education level was grades 9–11, some college, or a bachelor's degree or higher to those with a high school diploma, by sex: 1970–94

* This ratio is most useful when compared to 1.0. For example, the ratio of 1.52 in 1994 for males whose highest education level was a bachelor's degree or higher means that they earned 52 percent more than males who had a high school diploma. The ratio of 0.68 in 1994 for males whose highest education level was grades 9–11 means that they earned 32 percent less than males who had a high school diploma.

Starting salaries of college graduates

- ◆ **Between 1977 and 1993, college graduates who majored in computer sciences and engineering had much higher starting salaries than did graduates in all other fields of study; while the salary benefit of majoring in such fields was high, it declined between 1980 and 1993.**
- ◆ **Starting salaries among graduates who majored in the humanities or education have fluctuated over time, but in general, they were considerably lower than the starting salaries for all graduates. Salaries in both fields, however, rose relative to those of all graduates between 1984 and 1993.**
- ◆ **Among 1993 graduates, females were much more likely than males to major in education, and males were more likely than females to major in computer sciences and engineering; the most common field of study for both males and females was business. The starting salary benefits for those who majored in business increased between 1986 and 1993.**
- ◆ **Median starting salaries for 1993 male graduates were substantially higher than those for female graduates, both overall and within certain fields of study including business, social and behavioral sciences, and natural sciences.**

One of the values that students place on the field of study they choose for their bachelor's degree is the earning potential associated with occupations in that field. Starting salaries offered by employers are related not only to the value of the skills learned by college graduates but also to the supply of qualified individuals. Thus, differences in starting salaries shed light on the changing demands of the labor market and the response of students and the education system to those changes.

Percentage difference between median starting salaries for all college graduates and college graduates in particular major fields of study: Selected years of graduation 1977–93

Major field of study	Year of graduation					
	1977	1980	1984	1986	1990	1993
	Percent above or (below) median for all college graduates					
Humanities	(20.3)	(15.4)	(18.6)	(17.1)	(13.6)	(11.1)

Welfare participation, by educational attainment

- ◆ **In 1994, high school dropouts were more than twice as likely to receive income from Aid to Families with Dependent Children (AFDC) or public assistance as high school graduates who did not go on to college (14 compared to 6 percent).**
- ◆ **Between 1972 and 1994, high school dropouts, graduates who did not go on to college, and individuals with 13–15 years of school became more likely to receive AFDC or public assistance income.**

Public investment in education has many potential benefits for the nation, including reduced reliance on welfare and public assistance programs among those who attain higher levels of education. The extent to which individuals with more education rely less on such income may be viewed, at least partly, as a return on the social cost of providing public education.

Percentage of persons aged 25–34 who received income from AFDC or public assistance, by years of education completed: 1972–94

Year*	Years of school completed											
	All persons						White		Black		Hispanic	
	All levels	Less than 9 years	9–11 years	12 years	13–15 years	16 years or more	9–11 years	12 years	9–11 years	12 years	9–11 years	12 years

Voting behavior, by educational attainment

- ◆ **There is a strong positive relationship between voting behavior and educational attainment. As educational attainment increases, so does voting participation.**
- ◆ **In the 1994 congressional elections, college graduates aged 25–44 were 86 percent more likely than high school graduates to vote, while high school dropouts of the same age were 58 percent less likely than high school graduates to do so.**
- ◆ **Differences in voting behavior by educational attainment have generally widened over time among 25- to 44-year-olds.**
- ◆ **Young adults aged 18–24 who were enrolled in college were more likely to have voted in the 1994 congressional elections than their peers who were not enrolled in school (27 and 17 percent, respectively) (see supplemental table 37-1).**

Education plays a vital role in preparing individuals to actively participate in the political, economic, and social lives of their communities. Voting rates for groups with differing amounts of education are one indication of the relationship between educational attainment and exercising civic responsibility, such as voting.

Voting rates and ratios of voting rates for the population aged 25–44, by type of election and educational attainment: Selected years 1964–94

Type of election and year	total ¹	1–3 years of high school	4 years of high school	1–3 years of college	4 or more years of college

*Size, Growth, and Output of
Educational Institutions*

The education system must adapt to demographic changes in the population, as well as respond to changing social and economic conditions. In turn, these changes in the education system influence major support industries, future entries to the labor force, and future economic activity. The indicators in this section provide some evidence of changes in the size, growth, and output of educational institutions.

Enrollment

In 1994, approximately 64 million people in the United States, almost one in four, were enrolled in elementary and secondary schools, colleges, and universities.¹ This figure included 36 million students in kindergarten through grade 8; 13.6 million in grades 9–12; 5.5 million in 2-year colleges; and 8.7 million in 4-year colleges and universities (tables 38-1 and 39-1).

Although most students are enrolled in public educational institutions, a considerable number are enrolled in private institutions. In 1995, private schools enrolled 12 percent of all students in grades K–8 and 9 percent of all students in grades 9–12 (*Indicator 38*). For postsecondary education, the split between public and private institutions depended strongly on the type of institution; private institutions enrolled 4 percent of all 2-year college students, but 33 percent of all 4-year college and university students in 1994 (table 39-1). Institutions with less-than-2-year programs are predominately private and for-profit.²

The amount of time students in kindergarten and higher education spent in school changed substantially between 1970 and 1992. For example, the percentage of kindergartners who attend full day has more than tripled between 1970 and 1992. Forty-four percent of kindergarten students attended full day in 1992, compared to 13 percent in 1970 (*Indicator 37, Condition 1994*). Moreover part-time undergraduates in colleges and universities were more prevalent in recent years (an average of 41.8 percent between 1989 and 1991) than they were two decades earlier (an average of 28.2 percent between 1969 and 1971).³ However, most of this increase occurred between 1972 and 1982. Since then, the percentage of undergraduates attending college part time has remained fairly stable.

Growth of enrollment

After the end of World War II, the number of births per year reached a peak of 4.3 million in 1957. The baby boom period between 1946 and 1964 was followed by a period of declining births, which reached a low of 3.1 million in 1973. Since then, the number of births has gradually risen, peaking at 4.2 million in 1990.⁴ These trends are reflected, with lags, in the growth and decline of enrollments. For example, between 1970 and 1985, total public school enrollment fell about 14 percent, whereas between 1985 and 1995, it rose 14 percent. Private school enrollment remained relatively stable between 1970 and 1995, rising about 6 percent (*Indicator 38*).

Changes in enrollment trends appear first in elementary schools, and later in secondary schools. Enrollment in public schools in kindergarten through grade 8 declined throughout the 1970s, reaching a low point in 1984, but has risen since then. Enrollment in public schools in grades 9–12 declined between 1976 and 1990, fluctuating slightly in the mid-1980s. It then increased between 1990 and 1995, and is projected to continue increasing into the 21st century (table 38-1).

In higher education, the level of enrollment is not as closely tied to the number of births as it is in elementary and secondary schools, where enrollment is nearly universal. Total enrollment in higher education rose throughout almost all of the 1970s, as would be expected, given the increasing number of high school graduates. In the first half of the 1980s, enrollment remained relatively stable with a small drop in 1984. It rose each year between 1985 and 1992, despite the falling number of high school graduates after 1988 (*Indicator 40*), but then dropped slightly between 1992 and 1994 (*Indicator 39*). Two of the factors that account for the continued growth in enrollment are increasing enrollment rates among new high school graduates (*Indicator 7*) and an increasing number of college-age people (as a result of the children of baby boomers entering college).

The distribution of total enrollment between public and private institutions has changed little over the last two decades. Public institutions continue to enroll nearly 8 out of every 10

students. Within the public sector, enrollment in 2-year institutions grew faster than it did in 4-year institutions during the late 1980s and early 1990s. As a result, between 1985 and 1994, 2-year institutions increased their share of public enrollment from 35 to 37 percent, while 4-year institutions decreased their share from 43 to 41 percent (*Indicator 39*).

Diplomas and degrees

Whereas enrollment indicates the size of the education system, degree completions are one measure of the quantity of education the system is delivering. Each diploma or degree awarded indicates that the education system has made more knowledge and skill available in society. In 1994, public and private high schools awarded 2.5 million diplomas, and GED programs awarded half a million equivalency credentials.⁵

At the undergraduate level, the two most common credentials are the associate's and bachelor's degrees. The number of associate's degrees awarded, many of which are in occupationally specific fields, declined slightly during the late 1980s, following a period of rapid growth during the 1970s. The number of associate's degrees awarded increased in the early 1990s, and by 1993, more than half a million associate's degrees were awarded—representing an increase of 18 percent since 1988. The number of bachelor's degrees awarded grew throughout the 1980s and early 1990s. In 1993, colleges and universities awarded 1.2 million bachelor's degrees—25 percent more than in 1980 (table 40-1).

At the graduate level, more master's degrees were awarded than any other type of degree. In 1993, there were almost 370,000 master's degrees awarded, in contrast to 75,000 first-professional degrees and 42,000 doctor's degrees. The distribution of the type of degrees awarded changed somewhat during the last half of the 1980s. Following years of negative or little growth, the number of doctor's degrees awarded rose 28 percent between 1985 and 1993. Conversely, after a long period of growth, the number of first-professional degrees awarded decreased between 1985 and 1988, was stable through 1990, and then rose 6 percent between

1990 and 1993, returning to the 1985 level (table 40-1). The number of master's degrees awarded was 24 percent greater in 1993 than in 1980; this number declined 5 percent between 1980 and 1984, and then increased annually after 1984.

Fields of study

In 1993, about one-third of the bachelor's degrees awarded were in the fields of the humanities and the social/behavioral sciences, and more than one-fifth were awarded in business management. Sixteen percent of bachelor's degrees awarded that year were in the fields of science and engineering (9 percent in computer sciences and engineering, and 7 percent in natural sciences) (table 41-3).

The distribution of bachelor's degrees across fields of study has shifted several times over the last two decades (table 41-3). The proportion of degrees awarded in the humanities and social/behavioral sciences decreased in the 1970s and early 1980s, but has increased every year since 1986. Between 1977 and 1989, bachelor's degrees awarded in the natural sciences declined as a percentage of all bachelor's degrees awarded, but remained fairly stable in the early 1990s. The proportion of degrees awarded in computer sciences and engineering grew in the late 1970s and early 1980s but has declined since 1986. The proportion of bachelor's degrees awarded in business management grew during the late 1970s and early 1980s, but declined slightly in the early 1990s. The percentage of bachelor's degrees awarded in education in 1993 (9 percent) was less than half of what it was in the early 1970s (21 percent).

Elementary and secondary school enrollment

- ◆ From 1980 to 1995, total public school enrollment rose 14 percent, after falling 14 percent between 1970 and 1985; public schools continue to enroll almost 9 out of 10 children (see supplemental table 38-2).
- ◆ Total private school enrollment increased 4 percent between 1970 and 1985, but rose only 3 percent between 1985 and 1995.
- ◆ Total public school enrollment is projected to rise from 45.9 million in 1996 to 48.5 million by 2006, an increase of almost 6 percent. During this same period, total private school enrollment is expected to increase 5 percent, rising from 5.8 million to 6.1 million.
- ◆ Between 1970 and 1994, the share of total public school enrollment increased in the South and West, while it declined in the Northeast and the Midwest.

School enrollment is one measure of the size of the education system and of the demand for teachers, buildings, and other resources. Past trends and projected future changes in the composition of enrollment across levels of education and regions of the country, as well as between public and private schools, indicate the types of teachers and other resources required. Demographics, such as birth rates and immigration, are a primary factor in determining elementary and secondary school enrollment.

Elementary and secondary school enrollment in thousands, by control and level of school, with projections: Selected years, fall 1970–2006

Year/period	Public schools			Private schools		
	Grades K–12 ¹	Grades K–8 ¹	Grades 9–12	Grades K–12 ¹	Grades K–8 ¹	Grades 9–12

Elementary and secondary school enrollment, by control and level of school and region

Percentage distribution of public elementary and secondary school enrollment, by region: Fall 1970 and 1994

* Enrollment includes a relatively small number of nursery school students.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics*, 1995 (based on Common Core of Data) and *Projections of Education Statistics to 2006*, 1996.

College and university enrollment, by type and control of institution

- ◆ After rising fairly steadily between 1972 and 1991, total enrollment in public 4-year institutions decreased slightly between 1991 and 1994. Total enrollment in private 4-year institutions grew during the 1970s, fluctuated between 1981 and 1985, and has grown steadily since then.
- ◆ Enrollment in public 2-year institutions fell between 1982 and 1985. However, between 1985 and 1992, it increased annually, with the largest growth occurring between 1990 and 1991. Enrollment fell slightly again between 1992 and 1994.
- ◆ The distribution of total enrollment between public and private institutions has changed little over the last two decades. Public institutions continue to enroll nearly 8 out of every 10 students.
- ◆ Within the public sector, enrollment in 2-year institutions grew faster than it did in 4-year institutions during the late 1980s and early 1990s. As a result, 2-year public institutions increased their share of enrollment from 35 to 37 percent between 1985 and 1994.

Colleges and universities offering 2- and 4-year programs under public and private control address somewhat different student needs. Fluctuations in enrollments may indicate, among other things, changes in student interest in the various kinds of services offered, the cost of attendance, and the availability of student financial aid.

Index and percentage of total enrollment in higher education, by control and type of institution: Fall 1972–94

Fall of year	Index of total enrollment (1981=100)					Percentage of total enrollment			
	All institutions	Public 4-year	Public 2-year	Private 4-year	Private 2-year	Public 4-year	Public 2-year	Private 4-year	Private 2-year

Degrees conferred, by level

- ◆ In 1993, the number of associate's, bachelor's, master's, doctor's, and first-professional degrees awarded all reached their highest levels to date, despite a decline in the number of high school diplomas and GED credentials awarded during most of the 1980s and early 1990s.
- ◆ Following years of decline or little growth, the number of doctor's degrees conferred rose 28 percent between 1985 and 1993.
- ◆ The number of master's degrees conferred fell between 1977 and 1984, but increased each year after that, rising 30 percent between 1984 and 1993.
- ◆ After a period of decline in the mid-1980s, the number of both associate's and first-professional degrees conferred grew between 1988 and 1993 (18 and 7 percent, respectively).

Trends in the number of degrees conferred, by degree level, can indicate changes in the productivity of the nation's higher education system, the allocation of resources within the system, and the level of newly trained individuals within society. Viewed in relation to the eligible population—for example, the number of high school graduates—the data show whether degrees conferred have lagged behind or have exceeded growth in that population.

Bachelor's degrees conferred, by field of study

- ◆ After declining for several years, the number of degrees conferred in the humanities and the social and behavioral sciences has grown since the mid-1980s. Combined with business degrees, these three types of degrees have constituted half or more of all degrees conferred since 1971.
- ◆ After a sharp decline between 1986 and 1991, the number of degrees conferred in computer sciences and engineering leveled off between 1991 and 1993.
- ◆ Natural science degrees as a percentage of all degrees conferred dropped from 10 percent in 1971 to less than 7 percent in 1993; a major factor in this decrease was the sharp decline in the percentage of degrees conferred in mathematics between 1971 and 1981 (see supplemental table 41-3).
- ◆ Business degrees grew as a percentage of all bachelor's degrees conferred between 1971 and 1988, when they reached a peak of 24 percent. Between 1988 and 1993, their share of total degrees fell to 22 percent (see supplemental table 41-3).

Changing opportunities within the job market affect the fields in which students choose to major. In turn, students' choices of major affect the demand for courses and faculty, as well as the supply of new graduates in different fields. Trends in the number and proportion of bachelor's degrees conferred in different fields help to identify these changing conditions.

Index of the number of bachelor's degrees conferred and the percentage of total bachelor's degrees conferred, by field of study: Selected academic years ending 1971–93

*Climate, Classrooms, and Diversity in
Educational Institutions*

Education quality is reflected not only in the subjects taught and student achievement levels, but also in the learning environment in schools. A school's learning environment is enhanced by the diversity of its students, opportunities they have for community involvement, and their access to teachers. Teachers, in turn, affect school climate by their involvement in policy decisions, autonomy in their classrooms, and use of professional time.

Diversity of students

The characteristics and needs children bring to school based on their family backgrounds, economic well being, disabilities, and race/ethnicity influence the environment in which learning occurs.

Race/ethnicity

The racial/ethnic composition of the student population contributes to the increasing linguistic and cultural diversity of our nation's elementary and secondary schools. Along with the rich opportunities for learning that diversity brings, come challenges and risks associated with poverty, which is more concentrated among minority than nonminority students. Growth in the Hispanic population over the past decades has increased their representation in schools of all types. Like black students, Hispanic students are more concentrated in central city public schools than in other areas. In 1993, black and Hispanic students together made up over 50 percent of students in central city public schools (*Indicator 40, Condition 1995*).

There is less student racial/ethnic diversity at the postsecondary level than at the elementary and secondary levels. In 1992, one out of five postsecondary students was a member of a minority group, compared to one out of three public elementary/secondary students (*Indicator 45*). This difference is due both to lower college enrollment rates of minorities, with the exception of Asian/Pacific Islanders, and to their smaller representation in the college-aged population. Colleges and universities have sought to increase the racial/ethnic diversity of their student bodies, and since the mid-1970s, minority enrollment has increased from 15 to 23 percent. This increase is due primarily to increased enrollment of Hispanic and Asian/Pacific Islander students, whereas the enrollment of black students has remained fairly

steady at 9 to 10 percent of all students. Minority students were more concentrated in 2-year than in

4-year institutions, with the difference due mostly to the higher proportion of Hispanic students in 2-year institutions. At 4-year institutions, the proportion of black students was twice that of Hispanic students.

Poverty

After declining in the 1960s, the percentage of children in poverty rose to nearly 22 percent in 1983, and has fluctuated between 19 and 22 percent since then. Black and Hispanic children were more than twice as likely as white children to be poor (*Indicator 44*). Both the increased incidence of poverty among black and Hispanic children and their concentration in central city public schools have implications for those schools.

Students with disabilities

The number of students participating in federal programs for children with disabilities has been increasing at a faster rate than total public school enrollment. Between 1977 and 1994, the number of students who participated in federal programs for children with disabilities increased 46 percent, while total public school enrollment decreased 2 percent (table 43-1). This increase was also characterized by a shift in the classification of students by type of disability: the percentage of students with specific learning disabilities doubled, and those with speech and language impairments and with mental retardation decreased (*Indicator 43*).

Climate

Student absenteeism and tardiness

Exposure to classroom learning is limited by the amount of time students spend there. When students are absent or tardy, they not only forgo their own learning opportunities, but also may interfere with the learning opportunities of their classmates. On a typical school day in 1994, nearly 6 percent of students in the nation were absent from school (*Indicator 42*). In general, more students were absent in public than private schools, and in central city than suburban schools. In public schools, absenteeism increased with the grade level of the school, ranging from 5 percent in elementary to 8 percent in high schools. Teachers' perceptions of the seriousness of absenteeism, tardiness, and cutting class follow similar patterns: in central city high

schools, between 25 and 50 percent of teachers consider these problems to be serious.

Drugs and alcohol are detrimental to individual users. When they are used in and around schools, they also are detrimental to learning and may create other problems. The same is true of school crime. Although in-school drug and alcohol use has fallen dramatically over the past decade, it appears again to be rising. Students still encounter people trying to sell drugs at school, and this is more likely to occur in public than in private schools, and in urban rather than rural schools (*Indicator 48, Condition 1995*). While drug use has declined, student crime and victimization rates have leveled off (*Indicator 47, Condition 1995*). However, the percentage of teachers who reported physical conflict among students and possession of weapons as problems in their schools has increased (NCES, "How Safe Are the Public Schools: What do Teachers Say?", *SASS Issue Brief, 1995*).

Participation in community service

Student participation in community service is seen as beneficial to both students and the projects and people they serve, and is required in many high schools for graduation. Forty-four percent of 1992 high school seniors had performed some type of community service in the previous 2 years, most of it on a strictly voluntary basis (*Indicator 46*). Overall, 8 percent of seniors participated because it was required for a class, but this varied from 34 percent of students in Catholic schools to 6 percent of students in public schools.

Classrooms

Teachers' authority to set school policy; their autonomy to determine what and how subjects are taught in their classrooms; and the amount of time they spend teaching and interacting with students are all conditions that vary by school, and may influence the quality of the educational enterprise.

Participation in school and classroom decision making

In general, both public and private school teachers believe that individually they have more control over decisions affecting their own classrooms than they do as a group over decisions affecting the school as a whole (*Indicator 47*). Perceived influence, both at the school level and within the classroom, is more widespread among private than public school teachers, and among secondary than elementary teachers, with the exception of disciplining students,

in which case more elementary than secondary teachers perceive they have considerable control.

Teacher workload and use of time

On average, both public and private school teachers, elementary and secondary, new and experienced, worked well beyond a 40 hour week in school year 1993–94 (*Indicator 48*). Although, on average, public and private school teachers were required to be at school 33 to 35 hours per week, they spent an additional 11 to 15 hours after school and on weekends in school-related activities. About one-fourth of these extra hours were spent interacting with students in activities such as coaching, tutoring, field trips, and transporting students. The remaining time was spent on activities such as preparing for classes, grading papers, and attending parent conferences and meetings. Less experienced teachers (those with less than 4 years of classroom experience) tended to spend more extra time (ranging from a half to two hours per week) than did more experienced teachers, but this time was allocated in the same proportions to student-related activities versus other types of activities.

As college costs have continued to rise, students and parents have joined in the debate on how faculty balance their time, focusing on how much time students are taught by professors versus lecturers and instructors. Between 1987 and 1992, a shift occurred among full-time faculty in how they allocated their time to these activities, as faculty in general tended to spend less of their time teaching (from 61 to 58 percent) and more on service and other duties (from 3 to 5 percent) (*Indicator 49*). And although instructors and lecturers were still likely to spend a greater portion of their time teaching than were professors, there was an increase across almost all levels of faculty in the number of student contact hours. Allocation of faculty time varies by type of institution; however, faculty at 2-year institutions spend more of their time teaching (almost 70 percent) and have many more student contact hours than faculty at 4-year institutions. In the progression from liberal arts and comprehensive colleges to doctoral and research universities, faculty spent proportionately less time teaching and more time conducting research. Overall, however, faculty in 1992 spent relatively less time teaching and more time on service and other duties than they did 5 years earlier.

Student absenteeism and tardiness

- ◆ Overall, an average of 6 percent of all students were absent on a typical school day in 1993–94. In each urbanicity type, students in public schools were more likely than those in private schools to be absent.
- ◆ In public schools, the absentee rate was highest in central city and lowest in rural schools. In public central city schools, the absentee rate increased with school level and the percentage of students who were eligible for free or reduced-price lunch.
- ◆ In public elementary, middle, and combined schools, absentee rates generally increased with rates of student poverty, as measured by the percentage of students eligible for free or reduced-price lunch (see supplemental table 42-1).
- ◆ In central city public high schools with a high poverty level (schools where more than 40 percent of students were eligible for free or reduced-price lunch), the average absentee rate was 12 percent (see supplemental table 42-1). In these high schools, 59 percent of teachers considered absenteeism, 47 percent considered tardiness, and 40 percent considered cutting class to be a serious problem (see supplemental table 42-2).
- ◆ Public school teachers' perceptions of the seriousness of absenteeism, tardiness, and cutting class rose sharply from elementary to middle school, and from middle to high school (see supplemental table 42-2).

An important aspect of students' access to education is the amount of time they actually spend in the classroom. When students are absent from school, arrive late, or cut class, they forgo opportunities to learn. Furthermore, when students disrupt classes by being late or absent, they interfere with lessons in progress and with other students' opportunities to learn.

Average percentage of students absent on a typical school day, by urbanicity and other selected school characteristics: School year 1993–94

Urbanicity	Total	Control		Public school level				Percentage of students eligible for free or reduced-price lunch in public high schools

Education of students with disabilities

- ◆ **The number of students participating in federal programs for children with disabilities has been increasing at a faster rate than total public school enrollment. Between 1977 and 1994, the number of students who participated in federal programs for children with disabilities increased 46 percent, while total public school enrollment decreased 2 percent (see supplemental table 43-1).**
- ◆ **In 1992, males with specific learning disabilities represented 7 percent of total public school enrollment, while females with this type of disability accounted for only 3 percent (see supplemental table 43-4).**
- ◆ **The percentage of disabled students identified as having specific learning disabilities rose 24 percentage points (from 22 to 46 percent) between 1977 and 1994, while the proportion identified as mentally retarded or with speech or language impairments each fell 16 percentage points (from 26 to 10 percent and from 35 to 19 percent of the total, respectively).**
- ◆ **The ratio of the number of students with specific learning disabilities per special education teacher serving them increased from 18 to 24 between 1977 and 1993. However, the ratio for all students with disabilities decreased over the same period; in 1977, there were 21 students per teacher, and in 1993, 16 students per teacher (see supplemental table 43-6).**

The Individuals with Disabilities Education Act (IDEA) mandates that all children have available to them a free and appropriate education designed to meet their unique needs. Changes in the number and distribution of students with disabilities affect the level of effort required of educators and policymakers to comply with the current law and help them to forecast the need for future resources.

Children from birth to age 21 who were served by federally supported programs for students with disabilities, by type of disability: Selected school years ending 1977–94

Type of disability	1977	1979	1981	1983	1985	1987	1989	1991	1993 ¹	1994

Children in poverty

- ◆ Of all children, the proportion who live in families with incomes below the poverty level decreased substantially during the 1960s to 15 percent in 1970, then rose to 22 percent in 1983. Between 1983 and 1994, the poverty rate for children has fluctuated between 19 and 22 percent.
- ◆ In 1994, both black and Hispanic children were more than twice as likely as white children to live in poverty.
- ◆ Since 1975, at least half the children in poverty lived in a female-headed household. The percentage of children in poverty who lived in a female-headed household increased to a high of 59 percent in 1988 and has fluctuated between 55 and 59 percent from 1988 to 1994.
- ◆ Between 1960 and 1994, the percentage of black children in poverty who lived in a female-headed household was consistently higher than the percentage of white or Hispanic children who did so. In 1994, 82 percent of black children in poverty lived in a female-headed household, compared to 46 percent of white and Hispanic children.

The effects of poverty on children's education are well documented. Children from poor families have lower than average achievement and higher than average dropout rates. These children may not come to school ready to learn, and therefore may need additional services.

Racial and ethnic distribution of college students

- ◆ **The student body at the nation's colleges and universities has become increasingly heterogeneous since the mid-1970s. Minority students increased from 15 percent of all students in 1976 to 23 percent in 1993. This increase was primarily due to the increased enrollment of Hispanic and Asian/Pacific Islander students, who, as a percentage of all college students, increased over 3 percentage points each.**
- ◆ **Black students accounted for 10 percent of the total enrollment at colleges and universities in 1993. Hispanics made up 7 percent, Asian/Pacific Islanders 5 percent, and American Indian/Alaskan Natives 1 percent of enrolled students.**
- ◆ **In 1993, minority students made up a greater proportion of the student body at 2-year than at 4-year institutions (27 compared to 20 percent, respectively).**
- ◆ **About equal proportions of black and Hispanic students enrolled in 2-year public colleges; however, about twice as many blacks as Hispanics enrolled in 4-year institutions in 1993.**

Colleges and universities seek diversity in their student bodies; variety in the backgrounds and interests of students enhances the learning environment. The racial/ethnic mix of college students is one aspect of student diversity. Variations in the racial/ethnic composition of college enrollment suggest differences in the needs, interests, and backgrounds of the student body.

Percentage of total enrollment in higher education institutions, by race/ethnicity and control and type of institution: Selected years, fall 1976–93

		Minority					
Fall of year and control and type of institution	White	Total minority	Black	Hispanic	Asian/ Pacific Islander	American Indian/ Alaskan Native	Nonresident alien

Community service performed by high school seniors

- ◆ In 1992, 44 percent of high school seniors reported that they performed some type of community service during the previous 2 years. Thirty-eight percent of seniors reported that some or all of their community service was voluntary, and 15 percent reported that some or all of their service was required.
- ◆ Eight percent of high school seniors reported, in 1992, performing community service during the previous 2 years that was required for class; 2 percent reported performing court ordered service and 8 percent reported that service; was required for other reasons.
- ◆ Approximately 51 percent of high school seniors in schools with a low poverty level (5 percent or less receiving free or reduced-price lunch) reported that they performed some type of community service during the previous 2 years, compared to 36 percent of high school seniors in schools with a high level of poverty (40 percent or more receiving free or reduced-price lunch).
- ◆ High school seniors who attended Catholic and other private schools were more likely to perform community service during the previous 2 years than were high school seniors who attended public schools. In fact, 34 percent of those high school seniors who attended Catholic schools performed community service that was required for a class.

Currently, there is considerable interest in involving a greater number of students in community service. Having students perform community service is seen as beneficial for both society and the individual. Community service provides staffing for community projects, prepares students for future roles in the community, and may provide students with experience they can use in their future careers. Data on community service performed by high school seniors show who participates and to what extent.

Percentage of high school seniors who reported performing community service during the previous 2 years, and the percentage of community service that was voluntary or required, by selected school characteristics and achievement test quartile: 1992

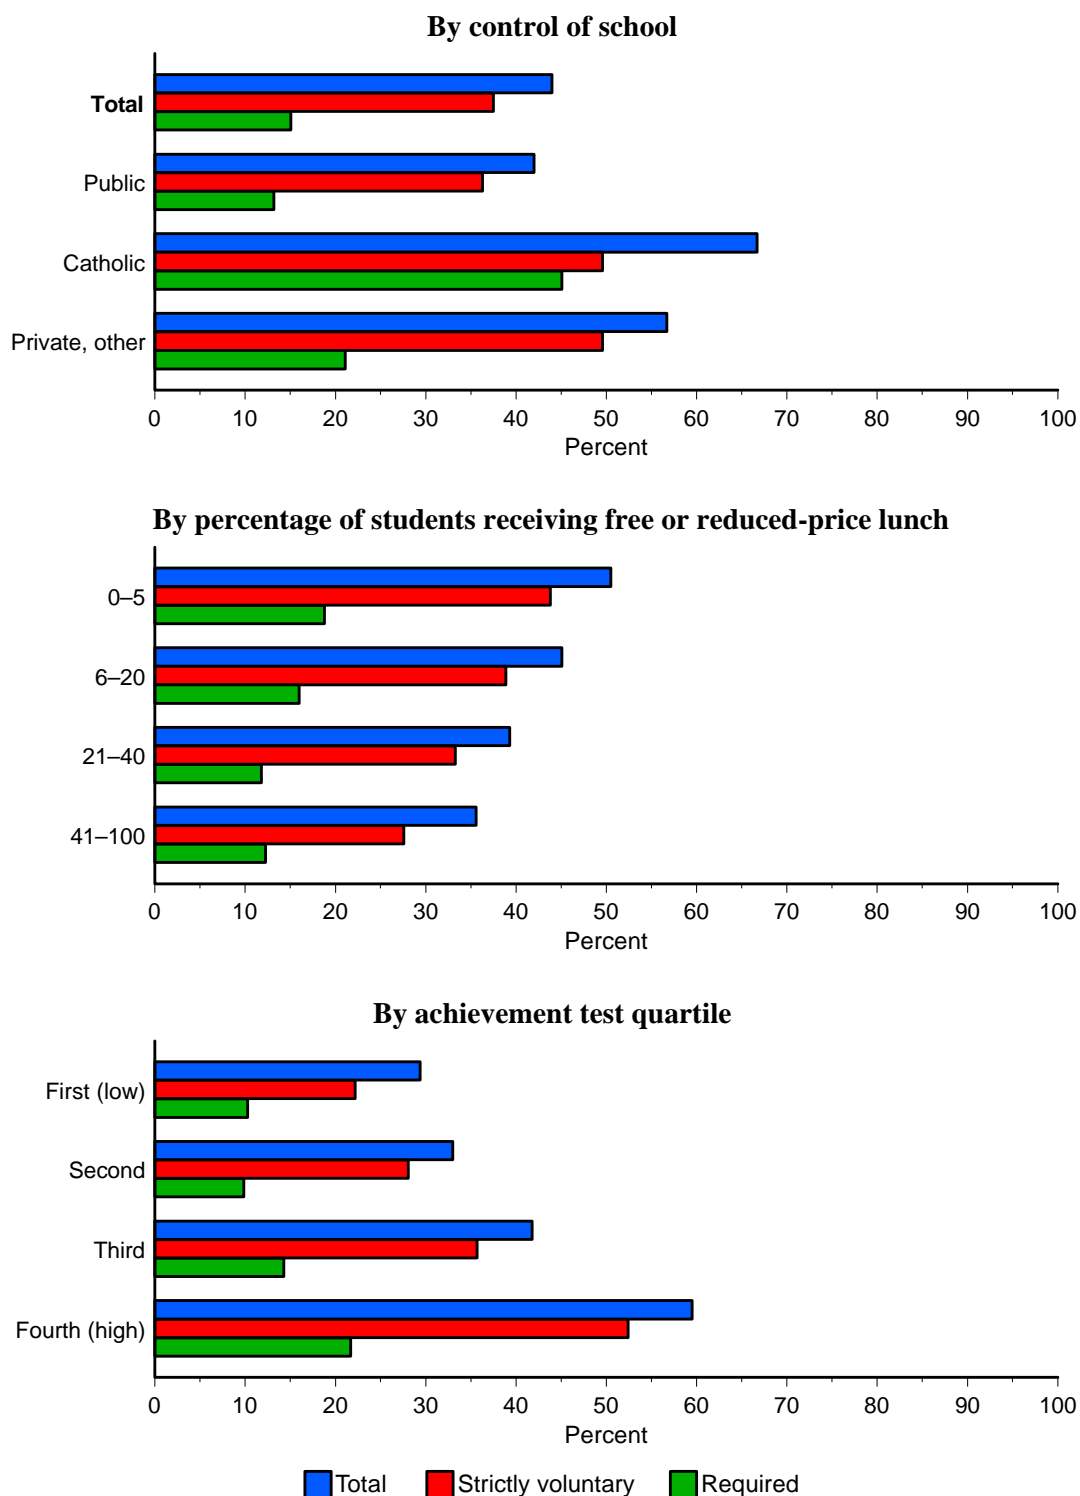

School characteristics and achievement test quartile	Total*	Some or all of community service was:				
		Strictly voluntary*	Required			
			Total*	For class	Court ordered	For other reasons
Total	44.0	37.5	15.1	7.6	1.5	8.4

Teachers' participation in school decision making

- ◆ **In 1994, a higher percentage of teachers perceived having a good deal* of control over their classroom decisions than they perceived teachers having a good deal of influence over their school's policies (ranging from 57 to 88 percent and 31 to 38 percent, respectively).**
- ◆ **Private school teachers were more likely than public school teachers to perceive having influence over their school policies and control over most of their classroom decisions in 1994.**
- ◆ **Public and private secondary teachers were more likely than elementary teachers to perceive having a good deal* of control over classroom decisions, except for the decision to discipline students over which elementary teachers perceived having more control.**
- ◆ **Private school principals were more likely than public school principals to attribute a good deal of influence to teachers on setting discipline policy and establishing curriculum.**

Two aspects that can affect school climate and responsiveness are the extent to which teachers participate in making decisions about important school policies and issues, and the autonomy teachers have in the classroom. Data on teachers' influence over school policies and control of their classrooms can contribute to current debates on teacher professionalism.

Teachers' and principals' perceptions of the amount of influence or control teachers had over selected school and classroom decisions in their schools, by control and level of school: 1994

Decisions	All schools	Public			Private		
		Total	Elementary	Secondary	Total	Elementary	Secondary
Percentage of teachers reporting that teachers had a good deal* of influence in their school over:							
Setting discipline policy	37.9	34.9	41.8	27.5	58.9	64.6	50.9
Determining the content of in-service programs	31.2	30.6	32.6	28.5	35.1	36.1	33.7
Establishing curriculum	37.2	34.6	32.2	37.2	55.4	54.5	56.6

Teaching workload of full-time teachers

- ◆ While full-time public school teachers were required to be at school 33 hours per week on average in 1994, they reported working 45 hours per week; private school teachers were required to be at school an average of 34 hours per week, but reported working 47 hours per week. Public and private full-time teachers reported spending extra hours (12 and 13 hours, respectively) before and after school and on weekends; of these extra hours, about one-fourth were spent in activities involving students.
- ◆ In 1994, public school teachers' classes were larger than those of their private school counterparts (23 students compared to 20 students per class).
- ◆ In 1994, less experienced teachers (those with less than 4 years of teaching experience) worked more total hours per week than did more experienced teachers (those with 4 or more years of teaching experience).
- ◆ Teachers' average class sizes varied by school urbanicity, percentage of minority students enrolled, and school size. In both public and private schools, class sizes were larger in central cities and urban fringe areas than in rural areas, in schools with higher proportions of minority students, and in larger versus smaller schools (see supplemental tables 48-1 and 48-2).

Ongoing debates about teachers' salaries, professional status, and instructional time spark interest in the amount of time teachers spend working, the number of classes they teach per day, and the number of students in each class. A teacher's work day does not end when classes are over. They are likely to spend additional time outside of school hours on work-related activities.

Average hours per week full-time teachers spent at school and in school-related activities, class size, and classes taught per day, by control and level of school and years of teaching experience: 1994

Control and level of school and teacher characteristics	Average hours worked per week	Average hours required at school	Average hours spent before and after school and on weekends			Average class size	Average number of classes taught per day*
			Total	Activities involving students	Other related activities		
Public	45.2	33.2	12.1	3.3	8.7	23.2	5.6
Level of school							
Elementary	44.0	33.0	11.0	1.7	9.2	22.7	6.4
Secondary	46.5	33.3	13.2	5.0	8.2	23.2	5.5
Years of teaching experience							
Less than 4 years	48.3	34.4	14.0	4.2	9.8	23.2	5.5
4 years or more	44.8	33.0	11.8	3.2	8.6	23.2	5.6
Private	47.1	34.2	12.9	3.6	9.3	19.6	6.0
Level of school							
Elementary	45.8	34.4	11.4	2.3	9.1	20.0	7.5
Secondary	49.1	34.0	15.2	5.7	9.5	19.5	5.7
Years of teaching experience							
Less than 4 years	48.6	35.1	13.5	4.0	9.6	18.6	6.0
4 years or more	46.8	34.0	12.8	3.6	9.2	19.8	6.0

Table reads: In 1994, public school teachers were required to be at school an average of 33.2 hours per week, and their average class size was 23.2 students.

* Since elementary teachers do not tend to teach separate classes, only 8 percent of the teachers who responded to this question were elementary teachers, while 92 percent were secondary teachers.

NOTE: Excludes a small number of teachers whose schools did not respond to the questionnaire. Details may not add to totals due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993–94 (Teacher Questionnaire).

Average hours per week full time teachers spent before and after school and on weekends, by control and level of school and years of teaching experience: 1994

Teaching workload of full-time postsecondary faculty

- ◆ In 1992, faculty members spent 59 percent of their work hours teaching, 16 percent conducting research, and 12 percent performing administrative tasks.
- ◆ Between 1987 and 1992, the percentage of time full-time postsecondary faculty members spent teaching decreased (from 61 to 59 percent), while the percentage of time they spent on service and other duties increased (from 3 to 5 percent).
- ◆ Generally, full professors tended to spend a higher percentage of their time conducting research than other professors in 1992. Assistant professors, instructors, and lecturers spent a higher proportion of time teaching than full or associate professors.
- ◆ Full-time postsecondary faculty members at 2-year institutions had more student contact hours per week in 1992 than did faculty at other institutions (over 75 percent more than those at research and liberal arts institutions and 40 percent more than those at doctoral and comprehensive institutions) (see supplemental table 49-1).

Teaching students is only one aspect of a postsecondary faculty member's job. Faculty members also spend time on other activities such as research, freelance work, administrative tasks, and professional growth activities. Debates about tenure, instructional time, and the overall quality of a college education raise questions about the actual time postsecondary faculty spend teaching relative to the time they spend doing these other activities.

Percentage of time full-time postsecondary faculty spent on various activities, by academic rank and type of institution: Fall 1987 and fall 1992

		Academic rank					Type of institution

Table reads: In the fall semester of 1992, full-time postsecondary faculty spent 58.8 percent of their work time in teaching activities.

* Included in the total but not shown separately are other types of academic ranks and postsecondary institutions.

NOTE: Totals may not add to 100.0 due to rounding. Includes only those faculty who taught at least one class for credit. Medical faculty are not included in this analysis. See the supplemental note to this indicator for further definitions of time spent by faculty.

Student exposure to faculty at institutions of higher education

- ◆ At research, doctoral, and comprehensive institutions in both 1987 and 1992, the majority of classroom exposure to faculty for students in undergraduate upper division courses and graduate courses was with senior faculty—full professors and associate professors.
- ◆ At comprehensive institutions in 1992, undergraduate students in lower division courses had less classroom exposure to senior faculty than did students in upper division courses.
- ◆ Students in undergraduate courses at research institutions had about the same classroom exposure to senior-level faculty as did students in undergraduate courses at comprehensive and liberal arts institutions. However, for undergraduate students in classes taught by senior-level faculty, those at research institutions were more likely to be in classes of more than 50 students than those at comprehensive and liberal arts institutions (see supplemental table 50-1).

An institution's most experienced faculty are its senior faculty. They have more teaching, research, and administrative experience. More contact with these faculty may enhance the quality of the learning environment for students at colleges and universities. One measure of a student's contact with senior faculty is the percentage of a student's classroom time spent with full or associate professors.

Percentage of classroom hours 4-year college and university students were exposed to faculty of different ranks, by type of institution, level of classes, and course division: Fall 1987 and fall 1992

*Human and Financial Resources of
Educational Institutions*

During the 1980s and early 1990s, education officials at our nation's schools, colleges, and universities faced challenges in providing students with a quality education, in light of constraints in the human and financial resources available to them. Nationwide the qualifications and training of teachers continue to be of concern. The percentage of limited-English-proficient and disabled students continues to rise. Also, postsecondary education institutions are confronting declining support from government appropriations and an increasing reliance on other financial sources, such as tuition. Furthermore, calls to raise the quality of education have grown as Americans feel increasing competitive pressure from the global marketplace.

Financial resources

The United States invests a substantial amount of its financial resources in education. Two ways of measuring this investment are 1) revenues from public sources for a particular level of education, divided by the number of students enrolled at that level; and 2) the national index of public effort to fund education, which is the ratio of the first measure to income per capita.

Elementary/secondary education

During the post-World War II era, per-pupil revenues from public sources for students in elementary and secondary schools increased substantially every decade. Between 1950 and 1993, these revenues increased about four and a half times, rising from \$1,230 to \$5,526 per student (adjusted for inflation) (*Indicator 51*). This trend may have been driven by many factors. For example, the education system has assumed greater responsibility in many areas, such as the education of disabled students. In addition, public policy has increased spending on children from poor families and has sought to increase the quality of education of minorities to a level comparable to that of the majority. Furthermore, the number of teachers and other school staff more than doubled between 1960 and 1993.*¹

The ability of taxpayers to finance a larger education budget has increased over time, but public revenue has risen at a much faster rate than the ability of the taxpayer to pay for public education. Between 1950 and 1993, personal income per capita increased about 140 percent, whereas public revenues per

student rose almost 350 percent. This change is captured in the national effort index (per-student revenues for elementary and secondary education from public sources as a percentage of personal income per capita). Revenues per student comprised 14 percent of personal income per capita in 1950, and 26 percent in 1993 (*Indicator 51*).

Some school districts receive more revenue per student than others. For instance, the wealthiest districts, in terms of median household income, had 16 percent more cost-of-living adjusted revenue per student than the poorest districts (*Indicator 53, Condition 1995*).

Among G-7 countries, the United States has one of the highest levels of public education expenditures per student as a percentage of Gross Domestic Product (GDP) (*Indicator 52*).

Higher education

Public revenues for higher education (adjusted for inflation) in 1993 were about \$4,665 per student compared to \$2,613 in 1950. The public education revenue per student raised for higher education increased between 1930 and the mid-1960s, and has remained fairly stable since then (*Indicator 51*).

Between 1980 and 1993, average revenue per student rose at public 4-year colleges and universities. While revenue from tuition and fees rose, revenue from government sources fell. Expenditures for administration and research rose more than expenditures for instruction. Although only a small part of the total, scholarship and fellowship expenditures also rose a great deal over this period (*Indicators 53 and 54*). At private 4-year colleges and universities, both revenue per student and expenditures per student rose more than at public institutions between 1980 and 1993. Not surprisingly, revenue from tuition and fees also increased dramatically at private institutions over this period.

Generally, among G-7 countries, only Canada showed a higher level of public education expenditures as a percentage of GDP for higher education than the United States (*Indicator 52*).

Human resources

The most important resource in education is personnel. In 1991, in elementary and secondary education, there were 11 full-time-equivalent (FTE) staff per 100 students. Of these, six were classroom

teachers; three were support staff, such as secretaries and bus drivers; and the remaining two were principals, assistant principals, school district administrators, librarians, guidance counselors, and teacher aides (*Indicator 57, Condition 1993*).

Supply of teachers

Over the last two decades, as fewer college graduates enter the teaching profession and student enrollments increase, policymakers have become concerned about the source of supply of new teachers. Schools depend on new college graduates, transfers, and reentering teachers to fill positions. Even though reentrants offer more teaching experience they demand higher salaries than first-time teachers. However, first-time teachers have higher rates of attrition. Between 1988 and 1991, the sources of supply of newly hired teachers shifted, as both public and private schools hired a larger proportion of first-time teachers (*Indicator 56*).

Teacher qualifications and training

Although it is very difficult to assess the quality of a teacher, many think that the education of teachers is an important measure of a teacher's qualifications. In public schools, in the 1993–94 school year, 9 out of 10 secondary students in science and social studies classes were taught by a teacher who either majored or minored in science or social studies, respectively. However, just over 8 out of 10 of students in English classes were taught by a teacher who majored or minored in English, and less than 8 out of 10 students in mathematics classes were taught by a teacher who majored or minored in math (*Indicator 57*).

While teachers' initial education and training are important, ongoing professional development throughout teachers' careers also contributes significantly to their teaching qualifications. In the 1993–94 school year, a majority of public school teachers received in-service education or professional development in topics such as the use of educational technology, methods of teaching, student assessment, and cooperative learning. Teachers received support for professional development in the form of time away from teaching, travel expenses, tuition and fees, and professional growth credits. However, 22 percent of public school teachers received none of this support for professional development (*Indicator 59*).

Teacher salaries

The cost of staff resources is determined not only by the number of staff employed but also by their salaries. In 1995, the average annual salary of public elementary school teachers was \$36,874 and for \$38,249 secondary school teachers. Between 1960 and 1972, teachers' salaries (adjusted for inflation) in public schools rose, fell until 1980, but then rose again throughout the 1980s, reaching their peak in 1991. Average beginning teacher salaries did not rise as rapidly as average teacher salaries during the 1980s. In fact, the average beginning teacher salary was \$24,463 in 1995, about the same level as two decades earlier (*Indicator 55*).

Teacher salaries are relatively low when compared to salaries of other professions that college students could pursue. Policymakers are concerned whether this discourages the best and brightest from choosing teaching as a profession. However, in 1992, elementary and secondary school teachers had prose literacy skills similar to those of physicians, engineers, social workers, writers and artists, private sector executives and managers, registered nurses, and sales representatives in the business and financial fields (*Indicator 58*).

Higher education faculty

In 1992, almost 80 percent of full-time faculty had earnings in addition to their basic faculty salaries, ranging from 64 percent of agriculture faculty to 87 percent of fine arts faculty. That year faculty members' basic salary was 84 percent of their total earned income. The proportion of earnings derived from other sources varied by field, from almost 13 percent among the humanities faculty to 20 percent among business faculty. Despite gains in the 1980s and early 1990s, the salaries of faculty (adjusted for inflation) were lower in 1994 than they had been two decades earlier (*Indicator 60*).

NOTE:

* U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics*, 1995, table 81.

National index of public effort to fund education

- ◆ After a 10 point increase between 1930 and 1970 (from 10.6 to 20.7), the national index of public effort to fund elementary and secondary education increased, with slight fluctuations, to 25.9 in 1993. Public education revenues per elementary and secondary student (in 1995 constant dollars) have risen from \$658 in 1930 to \$5,526 in 1993.
- ◆ The national index of public effort to fund higher education was 21.9 in 1993, one of the lowest levels since 1930. However, higher education public revenues per student (in 1995 constant dollars) have been relatively stable since 1970, with the exception of a drop in the early 1980s.
- ◆ After declining during the 1970s to mid-1980s, elementary and secondary public education revenues as a percentage of Gross Domestic Product (GDP) rose between 1988 and 1993, but have not rebounded to the levels in the early to mid-1970s. Higher education revenues as a percentage of GDP have remained about 1 percent since the mid-1960s.

The national index of public effort to fund education is a measure of money raised for the education of students relative to the wealth of the taxpayers. The numerator is revenues per student, a measure of average financial resources available for the education of each student. The denominator is personal income per capita, a measure of the taxpayer's average ability to pay.

National index of public effort to fund education (public revenues per student in relation to per capita personal income), by level: Selected school years ending 1930–93

School year ending	National index ¹		Public education revenues				Per capita personal income ^{2,3}
	Elementary/ secondary	Higher education	Per student ⁴		As a percentage of GDP

International comparisons of public expenditures for education

◆ Across most measures of public education expenditures, Canada, the United States, and the United Kingdom spent more than other G-7 countries in the 1991–92 school year.

◆ Public expenditures in the United States were 0.2 percent of the Gross Domestic Product (GDP) for preprimary education, 3.5 percent for the primary-secondary grade levels, and 1.2 percent for higher education. France spent a larger fraction for preprimary education, while the former West Germany spent the same fraction as the United States. Only Canada and the United Kingdom expended a larger fraction than the United States for primary-secondary education, and only Canada expended a larger proportion for higher education.

Public education expenditures are an indication of public investment in education. In the United States and other countries, there are additional private expenditures for education. Three alternative measures allow examination of the magnitude of public investment in education. The first provides a measure of the fraction of a country's resources that are allocated to public education. The second provides a measure of the public investment in each child in the education system. The third provides a measure of public educational investment in each child compared to available resources per person in the country.

◆ In the primary-secondary grades, public expenditures per student in the G-7 countries ranged from about \$2,700 in Japan to \$4,800 in Canada and \$5,000 in the United States. In higher education, public expenditures ranged from about \$2,100 in Japan to \$10,700 in Canada and \$7,100 in the United States.

Public expenditures for education, by level of education and country: School year 1991–92

	Per student ¹								
	As a percent of GDP ²			Constant 1991–92 U.S. dollars ³			As a percentage of GDP per capita		
	Pre- primary	Primary- secondary	Higher education	Pre- primary	Primary- secondary	Higher education	Pre- primary	Primary- secondary	Higher education
G-7 countries									
Canada ⁴	—	4.4	2.6	—	\$4,752	\$10,715	—	23.9	53.8
France	0.6	3.4	0.8	\$2,302	3,636	4,701	12.4	19.6	25.4
Former West Germany ⁵	0.2	2.0	0.8	1,180	3,048	5,749	5.8	15.0	28.3

—Not available.

— Not available.

¹ Enrollment is in all institutions, public and private, and is based on headcount estimates for preprimary through 12th grade. For higher education, it is full-time-equivalent enrollment.

² Gross Domestic Product (GDP) is Gross National Product (GNP) less net property income from abroad.

³ Purchasing Power Parity (PPP) indices were used to convert other currencies to U.S. dollars. Because the fiscal year has a different starting date in different countries, within-country Consumer Price Indices (CPIs) were used to adjust the PPP indices to account for inflation.

⁴ Canada did not report separate figures for expenditures on preprimary education; preprimary expenditures are included in the primary-secondary expenditure figures. If one were to apportion Canada's expenditures across the preprimary and primary-secondary education levels according to their relative enrollments, and then remove the preprimary expenditures, it would reduce Canada's expenditures per student as a percentage of GDP by 0.2 percentage points, and its expenditures per student as a percentage of GDP per capita by 1.0 percentage point, while increasing its expenditures by \$181.

⁵ Includes contributions to the pension funds of teachers who are civil servants. Expenditure data for publicly supported private schools include capital expenditures.

⁶ Excludes expenditures on nursing and paramedical education.

NOTE: The fiscal year begins in different months in the above countries. See the supplemental note to *Indicator 51* for an explanation of how expenditures were adjusted. See the supplemental note to this indicator for an explanation of how expenditures were adjusted and for further discussion on higher education and private expenditures.

Higher education expenditures per student

- ◆ **Overall spending per full-time-equivalent (FTE) student increased at all types of higher education institutions between 1983 and 1993. In 1995 constant dollars, increases ranged from 10 percent at public 2-year colleges (from \$5,378 to \$5,937 per FTE student) to 44 percent at private universities (from \$23,610 to \$34,039 per FTE student).**
- ◆ **Although instructional expenditures per FTE student increased between 1983 and 1993, instructional spending as a percentage of total expenditures fell at all types of institutions. Decreases were greater in public universities, public 4-year colleges, and private 4-year colleges than in private universities and public 2-year colleges (see supplemental table 53-2).**
- ◆ **Research expenditures have climbed by 44 percent in private universities (from \$4,219 to \$6,077) and by 43 percent in public universities (from \$2,841 to \$4,051) between 1983 and 1993. Over the decade, research spending accounted for roughly 18 percent of total institutional expenditures in private universities, and climbed from 19 to 22 percent of total spending in public universities (see supplemental table 53-2).**

Faculty and staff salaries and institutionally supported research account for a large share of higher education expenditures. Since differences in institutional spending can affect the quality of instruction and learning experiences, understanding variations in expenditure categories can provide some insight into the organization and operation of higher education institutions.

Educational and general expenditures of institutions of higher education per full-time-equivalent (FTE) student (in 1995 constant dollars), by selected expenditure categories and type of institution: Academic years ending 1977–93

Higher education revenues per student

- ◆ **The primary source of revenue for public institutions is from federal, state, and local government appropriations. Between 1983 and 1993, government appropriations per full-time-equivalent (FTE) student fell both in constant dollars and as a share of all revenue at public institutions. At public universities, for example, government appropriations per FTE student fell from \$7,760 to \$7,386 in constant dollars and from 52 to 43 percent as a share of revenue between 1983 and 1993 (see supplemental table 54-2).**
- A substantial proportion of higher education revenues is made up of student tuition and fees, government appropriations, and private gifts and endowment. Since access to higher education is partially determined by its cost to students, changes in the relative importance of these revenue sources can influence a student's decision to pursue a higher education degree.*
- ◆ **A second important source of revenue for public institutions is tuition and fees. Between 1983 and 1993, tuition and fees per FTE student increased both in constant dollars and as a share of all revenue at all public institutions. At public universities, for example, tuition and fees rose from \$2,814 to \$3,941 in constant dollars and from 19 to 23 percent as a share of revenue between 1983 and 1993 (see supplemental table 54-2).**
 - ◆ **Between 1983 and 1993, average tuition and fee revenue per FTE student increased at private universities, rising from \$10,306 to \$14,491 in constant dollars. In addition, revenue from private gifts and endowment income per FTE student climbed by 51 percent (from \$4,729 to \$7,130), compared to 2 percent at private 4-year colleges (from \$2,545 to \$2,587).**

Salaries of teachers

- ◆ **Between 1980 and 1995, the average salary of all public school teachers, adjusted for inflation, increased 19 percent, rising from \$31,412 to \$37,436.**
- ◆ **Following a period of decline in the 1970s, public school teachers' salaries increased continuously throughout the 1980s and into the early 1990s, reaching a peak of \$37,725 in 1991. Since then, salaries have fluctuated slightly (see supplemental table 55-1).**
- ◆ **The average beginning salary of public school teachers increased 24 percent between 1980 and 1995, rising from \$19,749 to \$24,463.**
- ◆ **Public and private school teachers in rural schools had lower average base salaries than teachers in urban fringe or central city schools. Central city public school teachers had lower average base salaries than urban fringe public school teachers.**

How to attract and retain quality teachers has long been discussed among education officials. Concerns about such issues have led to reforms designed to increase teacher benefits. These measures include creating new career steps or paths; establishing teaching positions with greater authority and responsibility; instituting merit pay schemes; and experimenting with teachers' salary structures. These measures have been associated with increases in teachers' salaries.

Average annual salaries (in 1995 constant dollars) of public elementary and secondary school teachers: Selected school years ending 1960–95

School year ending	All teachers	Elementary teachers	Secondary teachers	Beginning teachers*
1960	\$25,959	\$25,023	\$27,419	(*)
1964	29,682	28,740	31,024	(*)
1968	33,330	32,365	34,538	(*)
1972	36,014	34,971	37,223	\$25,462

Sources of supply of newly hired teachers

- ◆ **Between 1988 and 1994, there was a shift in the sources of supply of newly hired teachers as both public and private schools hired larger proportions of first-time teachers and smaller proportions of transfers and reentrants.**
- ◆ **Transfers from other teaching positions comprised about one-third of new hires in 1994. In the public sector, the majority of these teachers came from other public schools in the same state.**
- ◆ **In 1994, 57 percent of public and 43 percent of private first-time teachers came directly from college, representing a decrease of about 10 percentage points since 1988.**
- ◆ **In 1994, substitute teaching was an entry route into teaching for substantial proportions of both first-time and reentrant teachers.**

In the last two decades, as fewer college graduates have entered the teaching profession and student enrollments have increased, policymakers have become concerned about the supply of new teachers needed to meet the demand. Our school systems depend on first-time, transfer, and reentering teachers to meet demand. Reentrants offer more teaching experience and training but at higher salaries than first-time teachers. First-time teachers have higher attrition rates from the profession than transfer and reentrant teachers. The extent of dependence on these alternative sources has implications for school budgets and teacher recruitment and retention.

Percentage distribution of newly hired teachers, by control of school, supply source, and main activity in the previous year: School years ending 1988, 1991, and 1994

Supply source and main activity in the previous year	Public schools			Private schools

Education and certification of secondary teachers

- ◆ **In school year 1993–94, about three-quarters or more of public and private secondary students in all the core subjects, except mathematics, were taught by teachers who majored in that subject at the undergraduate or graduate level. Students in mathematics classes were less likely than students in any other core subject to be taught by a teacher who majored in that field.**
- ◆ **Private secondary students were more likely to be taught science* by teachers who majored in a science than were public school students. In both public and private schools, biology students were more likely than chemistry or physics students to have teachers who majored in that specific science.**
- ◆ **Students at public secondary schools with a high poverty level (more than 40 percent of students eligible for free or reduced-price lunch) were less likely to be taught any of the core subjects by a teacher who majored in that subject than were students at public secondary schools with a low poverty level (5 percent or less eligible for free or reduced-price lunch) (see supplemental table 57-2).**
- ◆ **In public secondary schools, mathematics students were generally less likely to be taught by teachers who were certified, majored, majored or minored, or who held a graduate degree in their class subject than were students taking any other main subject.**

Concern about the quality of education in the United States has focused interest on teacher qualifications and student exposure to well qualified teachers, especially in the core subject areas: English, mathematics, natural sciences, and social sciences. Educational background is one measure of teachers' qualifications. Whether teachers either majored or minored or are certified in the fields they teach is an indication of their substantive and academic qualifications in those subjects.

Percentage of secondary students in selected subjects taught by teachers with selected qualifications, by control of school and class subject: School year 1993–94

Control of school and class subject	Majored in class subject	Majored or minored in class subject	Graduate degree in class subject	Certified in class subject

Literacy of teachers

- ◆ **In 1992, teachers had literacy skills that were similar to private-sector executives and managers, engineers, physicians, writers and artists, social workers, sales representatives, education administrators, and registered nurses. Scientists were the only professionals who had measurably higher prose literacy skills than teachers.**
- ◆ **Although teachers had literacy skills that were similar to college graduates in many other occupations, their earnings were often substantially less. However, the average total number of weeks worked in 1991 was lower for teachers than for college graduates in many other occupations.**

An important issue in the education reform debate is the effect of comparatively low salaries on teacher quality. Prose literacy scores are one of the best available measures of verbal ability, a factor identified by research as being associated with teacher quality. If teachers have lower prose literacy scores relative to college graduates in other occupations, this could indicate that relatively low salaries may not be attracting the most skilled college graduates to the teaching profession and keeping them in it. If, however, the literacy levels of teachers are no lower than those of their counterparts in other occupations, other benefits (e.g., job security, a shorter work year, the opportunity to work with children, good retirement benefits, etc.) may be more important for attracting quality teachers than salary alone.

Prose literacy scores, labor market outcomes, and other characteristics of full-time employed bachelor's degree recipients, by selected occupations: 1992

Selected occupations	Average prose literacy scores	Average annual earnings in 1991	Average weekly wage last week	Average weeks worked in 1991	Average age	Percentage with graduate degrees	Percentage female

Table reads: In 1992, the average prose literacy score for all bachelor's degree recipients was 334, and it was 333 for teachers.

¹ Statistically significant difference from teachers.

² Includes prekindergarten and kindergarten teachers, elementary and secondary school teachers, teachers in special education, and teachers not elsewhere categorized.

NOTE: Individuals scoring between 326 and 375 were able to integrate or synthesize information from complex or lengthy passages. For example, at proficiency level 328, test-takers were able to state in writing an argument made in a lengthy newspaper article. See the supplemental note to Indicator 21 for a further description of literacy levels.

Teachers' participation in professional development

- ◆ **In school year 1993–94, 50 percent or more of full-time public school teachers participated in professional development on topics including uses of educational technology for instruction, methods of teaching in their subject field, student assessment, and cooperative learning in the classroom.**
- ◆ **Full-time public school teachers were more likely to participate in activities on all types of professional development topics than were full-time private school teachers. Full-time public elementary school teachers were more likely to participate in activities on four of the five types of professional development topics than were their secondary school counterparts.**
- ◆ **In school year 1993–94, 48 percent of full-time public school teachers received released time from teaching, and 41 percent received scheduled time for professional development. Twenty-two percent received none of the available types of support.**
- ◆ **Full-time public school teachers were more likely to receive professional growth credits and released and scheduled time from teaching than were their private school counterparts. However, private school teachers were more likely to receive tuition and/or fees than were public school teachers.**
- ◆ **Public elementary and secondary teachers in their first 3 years of teaching were more likely to have participated in a formal teacher induction program than were teachers with 4 or more years of experience (see supplemental table 59-1).**

Professional development for current teachers includes both seminars offered by schools or school districts and courses affiliated with institutions of higher education. The extent to which teachers pursue professional development while continuing to teach may indicate either the commitment of the teaching profession to improve teaching practice, or salary structures that reward participation in professional development.

Percentage of full-time teachers who participated in professional development during the 1993–94 school year, by topic, type of support they received, and control and level of school

Professional development topic and type of support received	Public			Private		
	Total	Elementary	Secondary	Total	Elementary	Secondary
In-service education or professional development topic						
Uses of educational technology for instruction	50.1	49.7	50.7	34.3	32.8	38.5
Methods of teaching in specific subject field	64.4	69.7	55.0	59.8	63.1	50.8
In-depth study in specific field	30.1	31.6	27.5	25.9	24.7	29.2
Student assessment	52.0	55.4	45.8	40.4	42.5	34.7
Cooperative learning in the classroom	51.5	52.7	49.2	43.6	45.5	38.5
Type of support received during the 1993–94 school year for in-service education or professional development						
Released time from teaching	48.1	50.7	43.5	41.7	42.6	39.2
Scheduled time	40.7	43.6	35.4	36.3	37.1	34.3
Travel and/or per diem expenses	23.3	21.2	26.9	21.1	19.8	24.6
Tuition and/or fees	23.0	24.3	20.7	35.3	36.0	33.3
Professional growth credits	32.7	34.8	28.9	26.0	27.7	21.3
None of the above	22.2	19.4	27.1	26.0	25.1	28.4

Table reads: In 1993–94, 50.1 percent of public school teachers and 34.3 percent of private school teachers participated in

Table reads: In school year 1993–94, 50.1 percent of public school teachers and 34.3 percent of private school teachers participated in professional development activities on the topic “the use of educational technology for instruction.”

NOTE: Excludes a small number of teachers whose schools did not respond to the questionnaire.

Percentage of full-time teachers who participated in professional development during the 1993–94 school year, by control and level of school

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993–94 (Teacher Questionnaire).

Salaries and total earnings of full-time postsecondary faculty

- ◆ In 1992, 79 percent of full-time faculty received earnings in addition to their basic faculty salary. The mean basic faculty salary was \$45,401, while the mean total earned income was \$56,597.
- ◆ The proportion of total earnings derived from sources other than basic faculty salaries ranged from almost 13 percent among the humanities faculty to 20 percent among business faculty.
- ◆ Business and engineering faculty had higher basic salaries than humanities and education faculty.
- ◆ Despite gains during most of the 1980s and early 1990s, the average salaries (adjusted for inflation) of faculty across all academic ranks were lower in 1994 than they had been more than two decades earlier (see supplemental table 60-1).
- ◆ While faculty members tended to have a higher basic salary the higher their academic rank, the proportion of total earnings derived from other sources was similar among faculty from all academic ranks.

Faculty salaries are an important component in attracting and retaining qualified instructional personnel. When evaluating the adequacy of full-time faculty salaries, it is essential to examine the earnings faculty members receive from other sources along with their total earned income and base salary amount. It is also important to note that salaries are a significant component of college and university expenditures.

Earnings of full-time postsecondary faculty (in 1995 constant dollars), by control of institution, academic discipline, and academic rank: Fall 1992

Control of institution, academic discipline, and academic rank	Percent of faculty with earnings in addition to basic faculty salary (BFS)	Mean basic faculty salary (BFS)	Mean total earned income (TEI)	BFS as a percentage of TEI (mean)
Total*	78.9	\$45,401	\$56,597	84.4
Control of institution				
Public	78.4	45,611	56,626	84.7
Private	80.2	44,888	56,527	83.7
Academic discipline				
Agriculture	64.2	48,175	59,295	86.9
Business	80.6	49,391	65,423	80.3
Education	81.1	42,127	52,142	84.2
Engineering	80.8	55,634	71,417	81.1
Fine arts	87.4	40,714	50,758	83.7
Humanities	74.6	41,059	48,775	87.5
Natural sciences	76.7	47,414	57,331	86.0
Social sciences	83.5	46,089	58,155	83.9
Academic rank				
Full professor	81.2	56,919	71,788	84.1
Associate professor	81.0	46,296	56,856	84.7
Assistant professor	76.9	36,940	45,488	85.0
Instructor	76.1	33,507	42,919	82.8
Lecturer	69.8	34,707	42,829	85.0

Table reads: In the fall semester of 1992, 78.9 percent of full-time postsecondary faculty had earnings in addition to their basic faculty salary.

* Included in the total but not shown separately are other academic disciplines and ranks.

NOTE: Medical faculty are not included in this analysis. See the supplemental note to this indicator for additional information on sources of earned income.

Supplemental Tables and Notes

Below are listed all of the supplemental tables and notes prepared for *The Condition of Education 1996*. Due to space limitations, all of the tables listed are not included in the printed volume; only those shown in bold are included here. To receive the complete set of tables (and any associated standard error tables), please fill out the reader's survey card and return it to the address shown.

Indicator 1

Table 1-1 Percentage of the population enrolled in school, by age: October 1970–94

Indicator 2

Table 2-1 Percentage of 3-year-olds enrolled in center-based programs and kindergarten, by selected student characteristics: 1995

Table 2-2 Percentage of 4-year-olds enrolled in center-based programs and kindergarten, by selected student characteristics: 1995

Table 2-3 Percentage of 5-year-olds enrolled in center-based programs and kindergarten, by selected student characteristics: 1995

Note Preprimary enrollment rates

Indicator 3

Table 3-1 Percentage of second-grade students age 8 or older, by family income, sex, and race/ethnicity: October 1972–94

Table 3-2 Percentage of fourth-grade students age 10 or older, by family income, sex, and race/ethnicity: October 1972–94

Table 3-3 Percentage of seventh-grade students age 13 or older, by family income, sex, and race/ethnicity: October 1972–94

Note Family income

Indicator 4

Table 4-1 Students in grades 3–6 who attended a chosen or assigned school, by race/ethnicity, urbanicity, parents' highest education level, and family income: 1993

Table 4-2 Students in grades 7–8 who attended a chosen or assigned school, by race/ethnicity, urbanicity, parents' highest education level, and family income: 1993

Table 4-3 Students in grades 9–12 who attended a chosen or assigned school, by race/ethnicity, urbanicity, parents' highest education level, and family income: 1993

Table 4-4 Percentage of parents of students in grades 3–12 who were very satisfied with aspects of their child's school, by type of school attended and grade level: 1993

Table 4-5 Parents' perceptions of their child's school, for children in grades 3–12, by type of school attended and grade level: 1993

Note School choice

Indicator 5

Table 5-1 Status dropout rates for persons aged 16–24, by sex, race/ethnicity, and family income: October 1972–94

Table 5-2 Tenth- to 12th-grade cohort dropout rates, by sex and race/ethnicity: 1982 and 1992

Note Dropout rates

Indicator 6

Table 6-1 Percentage of the sophomore class of 1980 in August 1982 and spring 1984 according to educational status, by selected characteristics

Table 6-2 Percentage of the sophomore class of 1990 in August 1992 and spring 1994 according to educational status, by selected characteristics

Table 6-3	Status of the sophomore classes of 1980 and 1990 in August 1982 and 1992 and spring 1984 and 1994, by educational status
Indicator 7	
Table 7-1	Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by sex and type of college: October 1972–94
Table 7-2	Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by race/ethnicity and type of college: October 1972–94
Table 7-3	Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by type of college, college enrollment status, and parents' highest level of education: October 1994
Table 7-4	Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by type of college, family income, and race/ethnicity: October 1972–94
Indicator 8	
Table 8-1	Percentage of high school graduates enrolled in college, by age, race/ethnicity and type of institution: October 1973–94
Table 8-2	Percentage of high school graduates enrolled in college, by age, race/ethnicity, and enrollment status: October 1972–94
Table 8-3	Percentage of high school graduates enrolled in college, by age, race/ethnicity, and level: October 1972–94
Indicator 9	
Table 9-1	Among 1989–90 beginning students at community colleges, percentage distribution according to attainment at first institution and 1994 attainment at any institution, by selected characteristics
Table 9-2	Among 1989–90 beginning students at community colleges, percentage distribution according to transfer status, by selected characteristics
Table 9-3	Among beginning students at community colleges, percentage distribution according to transfer status and degree attainment before transfer, by selected characteristics: 1989–94
Note	Community college outcomes
Indicator 10	
Table 10-1	Percentage distribution of 1989–90 beginning postsecondary students seeking bachelor's degrees according to persistence toward and completion of bachelor's and other degrees as of spring 1994, by selected characteristics
Note	Postsecondary persistence and degree completion
Indicator 11	
Table 11-1	Percentage of college graduates completing a bachelor's degree within various years of starting college, by selected student characteristics: 1993
Indicator 12	
Table 12-1	Average undergraduate tuition, room, and board (in 1995 constant dollars) as a percentage of income of all families, by selected family income percentiles and control of institution: 1964–94
Table 12-2	Average undergraduate tuition and fees (in 1995 constant dollars) paid by students in higher education institutions, by control and type of institution: Academic years beginning 1964–94
Indicator 13	

Table 13-1 Cost of college attendance and student financial aid for undergraduate students, by type and control of institution, dependency and attendance status, and family or household income of student: 1992-93

Note Postsecondary costs and student financial aid

Indicator 14

Table 14-1 Adult education participation rates for the past 12 months, by type of adult education activity, educational attainment, labor force status, race/ethnicity, age, and sex: 1995

Table 14-2 Percentage of work-related adult education activities, by type of provider, educational attainment, labor force status, race/ethnicity, and age: 1995

Indicator 15

Table 15-1 Explanations of levels of mathematics proficiency

Table 15-2 Percentage of students scoring at or above five levels of mathematics proficiency: 1978, 1982, 1986, 1990, and 1992

Table 15-3 Percentile distribution of mathematics proficiency scores, by age and race/ethnicity: 1978, 1982, 1986, 1990, and 1992

Table 15-4 Average mathematics proficiency, by age and parents' highest education level: 1978, 1982, 1986, 1990, and 1992

Table 15-5 Average proficiency scores, by age and grade: 1978, 1982, 1986, 1990, and 1992

Note NAEP cohorts

Indicator 16

Table 16-1 Explanations of levels of science proficiency

Table 16-2 Percentage of students scoring at or above five levels of science proficiency: 1977, 1982, 1986, 1990, and 1992

Table 16-3 Percentile distribution of science proficiency scores, by age and race/ethnicity: 1977, 1982, 1986, 1990, and 1992

Table 16-4 Average science proficiency, by age and parents' highest education level: 1977, 1982, 1986, 1990, and 1992

Table 16-5 Average proficiency scores, by age and grade: 1977, 1982, 1986, 1990, and 1992

Indicator 17

Table 17-1 Average reading proficiency by grade, race/ethnicity, and reading proficiency percentile: 1992 and 1994

Indicator 18

Table 18-1 Average U.S. history proficiency, by grade and parents' highest education level: 1994

Table 18-2 Average U.S. history proficiency, by grade, control of school, urbanicity, and geographic region: 1994

Table 18-3 Average U.S. history proficiency and time spent doing homework and watching television each day, by grade: 1994

Table 18-4 Average U.S. history proficiency, by grade and percentile: 1994

Table 18-5 Average U.S. history proficiency for 1994 high school graduates, by sex and school record: 1994

Indicator 20

Table 20-1 Average reading literacy (scale scores), by age, sex, and country: School year 1991-92

Table 20-2 Average scores across narrative, expository, and document domains for 9-year-olds on reading literacy assessment, by country: School year 1991-92

Table 20-3 Average scores across narrative, expository, and document domains for 14-year-olds on reading literacy assessment, by country: School year 1991-92

Table 20-4	Average reading achievement scores for students speaking a different language at home and for students speaking the school language, by country: School year 1991–92
------------	--

Indicator 21

Table 21-1	Percentage distribution of the five literacy levels within selected income quintiles, by literacy scale and country: 1994
Table 21-2	Percentage distribution of the population in selected age groups scoring at each of the five literacy levels, by literacy scale and country: 1994
Table 21-3	Percentage distribution of the population in selected occupations scoring at each of the five literacy levels, by literacy scale and country: 1994
Table 21-4	Percentage distribution of the population with selected educational attainment levels scoring at each of the five literacy levels, by literacy scale and country: 1994
Note	Definitions of literacy scales and levels

Indicator 22

Table 22-1	SAT test-takers as a percentage of high school graduates, percentage of test-takers who are minorities, SAT mean scores, standard deviations, and percentage scoring 600 or higher: 1972–95
Table 22-2	Average SAT scores of college-bound seniors, by race/ethnicity: 1976–95
Table 22-3	Percentage of college-bound seniors taking the SAT who scored in various ranges on the verbal and mathematics sections of the SAT, by sex: 1995
Table 22-4	Distribution of college-bound seniors and average verbal and mathematics SAT scores, by selected characteristics: 1988, 1991, and 1995
Table 22-5	Average verbal and mathematics SAT scores of college-bound seniors, by class rank expressed in quintiles: 1977–95
Table 22-6	Percentage of students intending to major in selected fields and their average verbal and mathematics SAT scores: 1995
Table 22-7	Percentage of graduating seniors taking the ACT and ACT composite scores, by race/ethnicity and type of program: 1991–95
Note	Interpreting SAT test scores and the new version of the SAT

Indicator 23

Table 23-1	Distribution of proficiency scores of 9-year-olds on mathematics assessment, by country: 1991
Table 23-2	Distribution of proficiency scores of 13-year-olds on mathematics assessment, by country: 1991
Note	Proficiency scores for IAEP mathematics and science

Indicator 24

Table 24-1	Distribution of proficiency scores of 9-year-olds on science assessment, by sex, percentile and country: 1991
Table 24-2	Distribution of proficiency scores of 13-year-olds on science assessment, by country: 1991

Indicator 25

Table 25-1	Percentage of 25- to 29-year olds who have completed high school, by race/ethnicity and sex: March 1971–95
Table 25-2	Percentage of 25- to 29-years-old high school graduates who have completed 1 or more years of college, by race/ethnicity and sex: March 1971–95
Table 25-3	Percentage of 25- to 29-years-old high school graduates who have completed 4 or more years of college, by race/ethnicity and sex: March 1971–95
Note	Educational attainment

Indicator 26

- Table 26-1** Percentage distribution of 1980 high school sophomores according to the timing, enrollment status, and institution type of their initial enrollment in postsecondary education, by student characteristics: 1982 and 1992
- Table 26-2** Percentage distribution of 1980 high school sophomores according to highest degree earned through 1992, by selected characteristics

Indicator 27

- Table 27-1** Percentage of the population who have completed secondary and higher education, by sex, country, and age: 1992

Indicator 28

- Table 28-1** Percentage of high school graduates earning a minimum number of units in core courses, by curriculum type and school characteristics: 1982, 1987, 1990, and 1994
- Table 28-2** Percentage of high school graduates earning the minimum number of units in core courses, by sex: 1982, 1987, 1990, and 1994
- Note** High school transcript studies

Indicator 29

- Table 29-1** Percentage of high school graduates taking selected mathematics and science courses in high school, by sex: 1982, 1987, 1990, and 1994
- Table 29-2** Percentage of high school graduates taking selected mathematics and science courses in high school, by race/ethnicity: 1982, 1987, 1990, and 1994
- Table 29-3** Percentage of high school graduates taking selected mathematics and science courses in high school, by control of school: 1982, 1987, 1990, and 1994
- Table 29-4** Percentage of high school graduates taking selected mathematics and science courses in high school, by urbanicity: 1987 and 1994
- Table 29-5** Percentage of high school graduates taking selected mathematics and science courses, by geographic region: 1982 and 1994
- Table 29-6** Percentage of high school graduates taking selected mathematics and science courses, by school program: 1982 and 1994

Indicator 30

- Table 30-1** Employment rates for recent high school graduates not enrolled in college and for recent school dropouts, by sex: October 1960–94
- Table 30-2** Employment rates for recent high school graduates not enrolled in college and for recent school dropouts, by family income: October 1972–94
- Table 30-3** Employment rates for recent high school graduates not enrolled in college and for recent school dropouts, by parents' highest education level: October 1994

Indicator 31

- Table 31-1** Percentage of 1992–93 college graduates who were working in administrative or clerical support occupations and the percentage who were unemployed, by sex and field of study: April 1994

Indicator 32

- Table 32-1** Percentage of 25- to 34-year-olds who were employed, by sex and years of school completed: March 1971–95
- Table 32-2** Percentage of 25- to 34-year-olds who were unemployed, by sex and years of school completed: March 1971–95
- Note** Labor force statistics

Indicator 33

- Table 33-1 Percentage distribution of 25- to 34-year-olds in the work force and of those not employed full-time and year-round, the percentage for whom that status was involuntary, by work status, sex, educational attainment, and race/ethnicity: Calendar year 1994
- Table 33-2 Percentage of workers aged 25–34 who usually worked full-time or part-time during the year, and the percentage of part-time workers for whom that status was involuntary, according to hours worked, by sex, educational attainment, and race/ethnicity: Calendar year 1994
- Table 33-3 Percentage distribution of 25- to 34-year-olds in the work force, by work status, sex, educational attainment, sex, and race/ethnicity: Calendar year 1994

Indicator 34

- Table 34-1 Median annual earnings (in 1995 constant dollars) of wage and salary workers aged 25–34 whose highest education level was grades 9–11, by sex and race/ethnicity: 1970–94
- Table 34-2 Median annual earnings (in 1995 constant dollars) of wage and salary workers aged 25–34 whose highest education level was a high school diploma, by sex and race/ethnicity: 1970–94**
- Table 34-3 Median annual earnings (in 1995 constant dollars) of wage and salary workers aged 25–34 whose highest education level was some college, by sex and race/ethnicity: 1970–94
- Table 34-4 Median annual earnings (in 1995 constant dollars) of wage and salary workers aged 25–34 whose highest education level was a bachelor's degree or higher, by sex and race/ethnicity: 1970–94**
- Table 34-5 Ratio of median annual earnings of wage and salary workers aged 25–34 whose highest education level was grades 9–11, some college, or a bachelor's degree or higher to those with a high school diploma, by sex: 1970–94

Indicator 35

- Table 35-1 Median salaries (in 1995 constant dollars) of college graduates who were working full time and who were not enrolled in college 1 year after graduation, by field of study, sex, and race/ethnicity: Selected years of graduation 1977–93
- Table 35-2 Percentage distribution of college graduates who were working full time and who were not enrolled in college 1 year after graduation, by field of study, sex, and race/ethnicity: Selected years of graduation 1977–93

Indicator 36

- Table 36-1 Percentage of 25- to 34-year-olds who received income from AFDC or public assistance, according to years of school completed, by sex, race/ethnicity, and region of the United States: 1972–94

Note on preprimary enrollment rates

Age of the child

For this analysis, the age of the child was calculated as of December 31, 1994.

Enrollment rates

The numerator of the enrollment rate used in this analysis is the number of children aged 3, 4, or 5 years old who, as of December 31, 1994, were enrolled in center-based programs or kindergarten. The denominator is the total number of children aged 3, 4, and 5 as of December 31, 1994. Children who were enrolled in first grade or higher, or who were in the "ungraded" category, were excluded from this analysis.

Race/ethnicity

A child's race/ethnicity is the composite of the National Household Education Survey (NHES) variables "race" and "Hispanic." If the child's ethnicity was Hispanic, he or she was classified as Hispanic, regardless of whether his or her race was classified as white, black, or other. Children of "other" race/ethnicity were included in the totals but not shown separately in this analysis.

Parents' highest education level

"Parents' highest education level" is the highest level of education of the child's parents or nonparent guardians who resided in the household. It is based on the highest education level of the mother or female guardian and the highest education level of the father or male guardian. If only one parent resided in the household, that parent's highest education level was used.

Poverty measure

The poverty measure used in this analysis was developed by combining information about household composition and household income. Household composition is the count of family members based on the relationship among the household members. The number of family

members is the number of persons in the immediate family of the child (e.g., parents, siblings, and the child him/herself). If the child had no parents in the household, the total number of household members was used. Household income is the second part of the poverty measure. NHES collects data on household income in increments of \$5,000 up to \$75,000. Information on the actual household income, which was available for about 7 percent of the population, was also used. Because exact household income was not available in most cases, the measure is an approximation. The household was categorized as poor if:

- The number of family was 2 and the household income is \$5,000 or less;
- The number of family was 2 and the actual household income is less than \$10,000;
- The number of family was 3 and the household income is \$10,000 or less;
- The number of family was 3 and the actual household income is less than \$12,000;
- The number of family was 4 or 5 and the household income is \$15,000 or less;
- The number of family was 5 and the actual household income is less than \$18,000;
- The number of family was 6 or 7 and the household income is \$20,000 or less;
- The number of family was 7 and actual household income is less than \$23,000;
- The number of family was 8 and the household income is \$25,000 or less; or
- The number of family was 9 or higher and the household income is \$30,000 or less.

Note on family income

The Current Population Survey (CPS) includes a family income variable that is used as a measure of a student's economic standing in many indicators in this publication. The three family income categories used in this publication are low, middle, and high income. Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent in-between. The table that follows shows the real dollar amounts, rounded to the nearest \$100, of the breakpoints between low and middle income and between middle and high income. For example, in 1994, low income was defined as the range between \$0–\$11,800; middle income was defined as the range between \$11,801–\$55,600; and high income was defined as the range between \$55,601 and over. Therefore, the breakpoints between low and middle income and between middle and high income are \$11,800 and \$55,600, respectively.

Dollar value (in current dollars) at the breakpoint between low and middle and between middle and high income categories of family income: October 1970–94

October	Breakpoints between:	
	Low and middle	Middle and high
1970	\$3,300	\$11,900
1971	—	—
1972	3,500	13,600
1973	3,900	14,800
1974	—	—
1975	4,300	17,000
1976	4,600	18,300
1977	4,900	20,000
1978	5,300	21,600
1979	5,800	23,700
1980	6,000	25,300
1981	6,500	27,100
1982	7,100	31,300
1983	7,300	32,400
1984	7,400	34,200
1985	7,800	36,400
1986	8,400	38,200
1987	8,800	39,700
1988	9,300	42,100
1989	9,500	44,000
1990	9,600	46,300
1991	10,500	48,400
1992	10,700	49,700
1993	10,800	50,700
1994	11,800	55,600

— Not available.

NOTE: Amounts are rounded to the nearest \$100.

Table 4-4 Percentage of parents of students in grades 3–12 who were very satisfied¹ with aspects of their child's school, by type of school attended and grade level: 1993

					Assigned public school

¹ Includes those who responded "very satisfied," from a scale of "very satisfied," "somewhat satisfied," "somewhat dissatisfied," and "very dissatisfied."

² Students whose parents indicated that their choice of residence was influenced by where their child would go to school.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1993 (School Safety and Discipline File).

Note on school choice

Race/ethnicity

A child's race/ethnicity is the composite of the National Household Education Survey (NHES) variables "race" and "Hispanic." If the child's ethnicity was Hispanic, he or she was classified as Hispanic, regardless of whether his or her race was classified as white, black, or other. Children of "other" race/ethnicity were included in the totals but not shown separately in this analysis.

Parents' highest education level

"Parents' highest education level" is the highest level of education of the child's parents or non-parent guardians who resided in the household. It is based on the highest education level of the mother or female guardian and the highest education level of the father or male guardian. If only one parent resided in the household, that parent's highest education level was used.

Private school enrollment data from two different surveys

According to data from the Schools and Staffing Survey (SASS), 9.8 percent of students in grades 3–12 were enrolled in private schools. Data from NHES show that 8.8 percent of students in grades 3–12 were enrolled in private schools. These differences in enrollment rates may be due to differences in survey methodology.

The SASS collects information on enrollment from a sample of schools, which is selected from a universe of schools. The schools in the sample were asked to report how many students were enrolled in their schools. The NHES is a household survey that asks parents to report the type of school in which their child was enrolled. Population estimates in the NHES were controlled to population totals developed by the Census Bureau.

Urbanicity

The NHES urbanicity variable is a linked-derived variable that categorizes the respondent's ZIP code as "urban" or "rural." The variable was created using the respondent's ZIP code to extract data from the 1990 Census of Population Summary Tape File 3B. "Urban" is further broken down into inside "urbanized area" (UA) and "outside UA." Definitions for these

categories were taken directly from the 1990 Census of Population. A UA comprises a place and the adjacent densely settled surrounding

territory that together have a minimum population of 50,000. The term "place" in the UA definition includes both incorporated places, such as cities and villages, and census-designated places, which are unincorporated areas designated by the Census Bureau in cooperation with state and local agencies in order to permit tabulation of data for Census Bureau products. The "densely settled surrounding territory" adjacent to places consists of contiguous and non-contiguous territories of relative high population density within short distances. "Urban outside of UA" generally includes incorporated or unincorporated places outside of the UA with a minimum population of 2,500.

Note on dropout rates

There are several ways to define and calculate dropout rates. Each type of dropout rate measures a different facet of dropping out. Three types of dropout rates are presented in this indicator: event rates, status rates, and cohort rates.

Event dropout rates

The event dropout rate is the percentage of students enrolled in grades 10–12 in October of a given year who are dropouts 1 year later. The high school persistence rate is 100 minus the event dropout rate. Calculating this rate requires estimating 1) the number of students who left high school before graduating (recent dropouts), and 2) the number of students who were enrolled in grades 10, 11, and 12 the previous October. Using data from the October Current Population Survey (CPS), the first is estimated as the number of persons aged 15–24 who were not enrolled during the month of the survey, who were enrolled 1 year earlier, and who have not completed 12 years of school. The second is estimated by the sum of three groups of 15- to 24-year-olds who were enrolled the previous October: 1) recent dropouts, 2) those enrolled in grades 11 and 12 during the survey month, and 3) those who have completed 12 (or more) years of school and who indicated that they graduated during the survey year. Those enrolled in special schools are counted as "not enrolled in regular school" and may be classified as recent dropouts if they had been enrolled in a regular school the previous October.

Status dropout rates

The status dropout rate is the total number of those who, at any given time, are not enrolled in school and who have not completed high school.

CPS data are used to calculate the number or proportion of individuals who, as of October of any given year, have not completed high school and are not currently enrolled in school. The numerator of this rate is the number of individuals aged 16–24 who, as of October of any given year, have not completed high school and who are not currently enrolled in school. The denominator is the number of persons in that age group in October of that year.

Those persons who are still in school and those who have completed high school after dropping out are not counted as dropouts.

Cohort dropout rates

The cohort dropout rate is the percentage of students who were not enrolled in high school and who had not graduated based on repeated measures of a group of individuals with a set of shared experiences. In this analysis, that set of shared experiences is enrollment in 10th grade in a given year.

The initial experience used to define the cohort group can be date of birth, age at a particular point in time, entry into school, grade level in school, or any one of a number of other specific events. These analyses can be done in one of two ways. Consecutive ages or grades taken from existing cross-sectional data across a series of years can be linked to portray the experiences of an age or grade cohort. Alternatively, a prospective study can be used, where particular grades in school have been selected as the starting points for longitudinal studies of educational process and experiences.

Change in questions used to report educational attainment

From 1972 to 1991, educational attainment in the CPS was reported as "years of school completed." Individuals with 12 years of school completed were regarded as high school graduates, and those with 16 years completed as college graduates. Years of schooling completed were based on responses to two questions: 1) "What is the highest grade . . . ever attended?" and 2) "Did . . . complete it?" For example, an individual who responded that the highest grade he or she ever attended was the first year of college and that he or she did not complete it was regarded as having completed 12 years of school.

Beginning in 1992, these two questions were changed to a single question: "What is the highest level of school . . . has completed or the highest degree . . . has received?" The earlier high school levels are listed as single summary categories such as "9th grade, 10th grade, or 11th grade." Then, several new categories were added, including "12th grade, no diploma;" "H.S. graduate—diploma or equivalent;" and "Some college—no degree." Finally, college degrees were listed by type, allowing for a more exact understanding of educational attainment. See the supplemental note to *Indicator 25* for further discussion of the effects of this change in the measurement of educational attainment.

Procedural changes

In 1994, the Bureau of the Census introduced several changes to procedures used in the CPS that may affect the comparability of statistics to those derived from earlier surveys. First, in 1994, the sample weights were calculated using information from both the 1980 and the 1990 Decennial Census. In earlier surveys, 1990 population figures were based on the 1980 Decennial Census and information collected during the 1980s on births, deaths, and migration. If, for some groups, the latter produces different estimates of their population than the former, the sample weights would change, as would statistics used to calculate them.

Second, the Bureau began using Computer-Aided Personal (and Telephone) Interviews (CAPI and CATI) to administer the survey in 1994. For earlier surveys, printed questionnaires were given to interviewers to

complete. It is well known that the method in which a survey is administered can have effects on the responses. Although substantial testing was done to minimize or predict these effects, all questions were not tested. Therefore, some statistics, such as dropout rates, may be affected by the change in survey procedures

Table 7-2 Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by race/ethnicity and type of college: October 1972–94

October	White			Black			Hispanic		
	Total	2-year	4-year	Total	2-year	4-year	Total	2-year	4-year

Table 7-3 Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by type of college, college enrollment status, and parents' highest education level:¹ October 1994

Parents' highest education level	Total	Type of college		Enrollment status	
		2-year	4-year	Full-time	Part-time
Less than high school graduate	43.0	24.5	18.5	36.1	6.9
High school graduate	49.9	18.1	31.8	44.7	5.2
Some college	65.0	24.8	40.1	59.5	5.5
Bachelor's degree or higher	82.5	20.2	62.3	78.7	3.8
Not available ²	43.1	18.5	24.6	36.2	6.9

¹ Parents' highest education level is defined as either 1) the highest educational attainment of the two parents who reside with the student, or if only one parent is in the residence, the highest educational attainment of that parent; or 2) when neither parent resides with the student (5 percent of the cases reported), the highest educational attainment of the head of the household and his or her spouse.

² Parents' highest education level is not available 1) for those who do not live with their parents and who are classified as the head of the household (not including those who live in college dormitories); and 2) for those whose parents' educational attainment was not reported. In 1994, 29 percent of respondents aged 16–24 were in this category.

— Too few sample observations for a reliable estimate.

⁸ For students who earned more than one award at the first institution, the first award they earned.

⁹ Highest degree attained at any institution. Students who have attained may also be enrolled.

¹⁰ Almost all of those enrolled at less-than-4-year institutions were enrolled at 2-year institutions.

¹¹ Limited to dependent students.

¹² Examines whether the student attended career-related lectures, participated in study groups with other students, talked about academic matters with faculty, or met with advisor concerning academic plans.

¹³ Examines whether the student had contact with faculty outside the class, went places with friends from school, or participated student assistance center/programs or school clubs.

¹⁴ Student-reported degree goal.

¹⁵ Institution-reported degree program.

¹⁶ Percent of months enrolled in which a student was also employed (1989–94).

¹⁷ Not applicable.

— Too sample observations for a reliable estimate.

¹ Destination of first transfer. See the supplemental note to this indicator for a definition of "transferred," limited to dependent students.

² Examines whether the student attended career-related lectures, participated in study groups with other students, discussed academic matters with faculty, or met with advisor concerning academic plans.

³ Examines whether the student had contact with faculty outside the class, went places with friends from school, or joined student assistance center/programs or school clubs.

⁴ Student-reported degree goal.

⁵ Institution-reported degree program.

⁶ Percent of months enrolled in which a student was also employed (1989–94).

⁷ Not applicable.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

Note on community college outcomes

The tables and figures presented in this indicator describe outcomes for first-time beginning students in postsecondary education who were enrolled in community colleges in academic year 1989–90. While this represents nearly half of all first-time beginners (45 percent), it represents a minority of the community college student body (22 percent) because it excludes continuing and returning students.

1994 attainment at any institution

The columns in the text table and table 9-1 that describe students' attainment and enrollment status as of 1994 characterize students with respect to highest postsecondary award attained and current enrollment status. Some students who attained an associate's degree also had attained a certificate, and some students who had attained a bachelor's degree also had attained a certificate or an associate's degree. Those who completed a certificate and an associate's degree were broken out with respect to enrollment at a 4-year institution. For these students, the "not enrolled at 4-year" column includes students who were enrolled at less-than-4-year institutions and students who were not enrolled.

Definition of transfer

Since the Beginning Postsecondary Student Longitudinal Study (BPS:90/94) does not include information on the transfer of credit between institutions, transfer as defined for this indicator does not imply transfer of credit. Rather, it simply characterizes observed transitions between institutions. For transfer to a less-than-4-year institution, any transition that was not followed by a return to the first institution constitutes a transfer. For transfer to a 4-year institution, any entry into a 4-year institution constitutes a transfer, regardless of subsequent enrollment, at the institution of origin.

It is also important to note that the transfer measures refer to the *first* transfer. Students may transfer more than once. For example, some students classified as having transferred to a less-than-4-year institution may have subsequently entered a 4-year institution.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal
Study, Second Follow-up (BPS:90/94).

Note on postsecondary persistence and degree completion

This indicator was constructed using data from the Beginning Postsecondary Students Longitudinal Study (BPS). BPS is based on a subsample of the 1990 National Postsecondary Student Aid Study (NPSAS), which consists of students beginning their postsecondary education for the first time at community colleges, vocational schools, and institutions granting bachelor's degrees during the 1989–90 academic year. The first BPS follow-up survey was conducted in the spring of 1992, 2 years after the student's entry into postsecondary education, and the second follow-up was conducted during the spring of 1994. BPS provides detailed information regarding individual student's attendance patterns for 5 years following his or her first enrollment into postsecondary education. (For more information on BPS, please see the *Sources of Data* section.)

The indicator examines persistence toward and completion of bachelor's and other types of degrees for students whose initial postsecondary degree objective when they first began postsecondary education in 1989–90 was a bachelor's degree, without regard to the type of institution in which they first enrolled. Using the student's reported degree objective rather than the type of program offered by the particular institution permits comparison of rates of persistence and degree completion between students with the same degree objective but with different demographic, institutional, and attendance characteristics.

Initial degree objective

Whether the student was seeking a bachelor's degree was determined by his or her response to the question "Toward which degree or other award are the courses you are taking leading?" Students could therefore be attending a 2-year institution but their degree objective was a bachelor's degree. Half of all beginning postsecondary students were working toward a bachelor's degree in 1989–90, and 25 percent of these students began at 2-year institutions that did not offer bachelor's degrees.

Persistence and degree completion

As this indicator was constructed, students were first divided into two broad categories: those who completed a bachelor's degree, and those who did not. Without regard to completion of other degrees, students who had not attained a bachelor's degree were then classified according to whether or not they were still enrolled toward a bachelor's degree. Students who were still enrolled toward a bachelor's degree were classified as such, while those who were no longer enrolled toward a bachelor's degree but had completed an associate's degree or certificate were categorized according to their highest degree completed. The remaining students who had not completed a degree after 5 years (bachelor's degree, associate's degree, or certificate) or who were still enrolled but not working toward a bachelor's degree, were categorized according to the number of months they were enrolled in postsecondary education. It is important to note that the number of months enrolled are not necessarily continuous months, so they cannot be used as an indicator of when the student left postsecondary education or stopped working toward a bachelor's degree. Rather, presenting the data in this manner is designed to give the an indication of the time spent in postsecondary attendance, although no degree was completed.

¹ Revised from previously published figures.

² Preliminary data based on fall 1993 enrollment weights.

NOTE: Tuition data are for academic years beginning 1964–94, and family income data are for calendar years 1964–94. Both calendar and school year Consumer Price Indexes (CPIs) were used to calculate constant dollar figures. "Tuition, room, and board" includes those for 2-year and 4-year colleges and universities. In-state tuition and fees are used for public institutions.

— Not available.

¹ The four categories of family income correspond to the four quartiles of family income calculated separately for dependent and independent students. For dependent students, the dividing points between income categories are \$27,000, \$45,000, and \$60,000; for independent students, the dividing points are \$10,000, \$21,000, and about \$36,000.

² Includes budget allowances for student living expenses and is adjusted for less than full-time or full-year attendance.

³ Includes grants, loans, and work-study earnings, and other forms of aid such as PLUS loans to parents.

⁴ Total cost minus total aid.

⁵ Expected Family Contribution (EFC) is calculated using the Congressional Methodology (CM) and is dependent on family income and assets and on the number of siblings in college. The student is also expected to contribute from summer job earnings. However, there are exceptions, and EFC can be zero.

⁶ Total cost minus total aid minus EFC. However, EFC is greater than net cost for many students, particularly those from high income families. Additional Family Contribution (AFC) is set to zero for those students. AFC is greater than the difference between average net cost and average EFC in the previous two columns.

NOTE: See the supplemental note to this indicator for further discussion of financial aid concepts and their calculation.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Postsecondary Student Aid Study, 1993 (Data Analysis System).

Note on postsecondary costs and student financial aid

The following definitions are used in the tables of *Indicator 13* and may clarify who or what is included or excluded in the various statistics.

Family income: For dependent students, the four family income categories ("low income," "lower middle," "upper middle," and "high income") were calculated on the basis of the income of their parents and correspond to the four quartiles of the distribution of parental family income. For independent students, the calculation was the same but was based on the income of the student and his or her spouse. It was the sum of adjusted gross income for the 1991 calendar year and any untaxed income.

Dependency status: Students were considered independent of their parents for financial aid purposes if the institutional records indicated they were independent, or if one of the following seven criteria were met: 1) the student was 24 years old on 12/31/92; 2) the student was a veteran; 3) the student was an orphan or a ward of the court; 4) the student had legal dependents other than a spouse; 5) the student was married and not claimed as a dependent on a parent's 1992 tax return; 6) the student was a graduate student and not claimed as a dependent on a parent's 1992 tax return; or 7) the student was single, an undergraduate, had not been claimed as a dependent on a parent's tax return for the previous 2 years, and was self-sufficient for 2 years before receiving any federal aid.

Tuition and fees: The actual amount of tuition charged the student for all terms he or she attended at all institutions during the 1992–93 academic year.

Total cost: The sum of tuition, fees, and the student budget for non-tuition expenses. The latter includes the cost of books and supplies, room and board, and commuting and other costs. The latter is also adjusted for students who attended less than full time for the full 1992–93 academic year. If the student was enrolled less than full time, full year, the student budget allowance for non-tuition expenses was set equal to 75 percent of the allowance for full time, full year students during the months that the student attended at least half time but less than full time,

and to 25 percent during months the student attended less than half time.

Grants: Total amount of all grants from federal, state, institutional, or other sources such as employer-paid tuition and National Merit Scholarships.

Net cost: Total cost (total student budget allowance, tuition and non-tuition combined, adjusted for actual attendance status) minus total aid. Total aid is comprehensive and includes, for example, SLS loans (federal supplemental loans for students), PLUS loans to parents (federal loans to parents with at least half-time dependent students), and aid received from the Department of Veterans Affairs and Department of Defense.

Expected family contribution (EFC): Used to calculate a student's need for financial aid. The most widely used methodology during the 1992–93 academic year was the Congressional Methodology (CM). The CM EFC is the sum of two components: a student contribution, and a parent contribution. The student is expected to contribute from savings and from summer jobs. The amount the parents are expected to contribute depends on their income and assets and whether they have other children in college. The EFC variable used in this indicator was taken from the student's financial aid records if available, computed using the CM if all the necessary information was available, and imputed using regression methods otherwise. This variable can be interpreted as what is a reasonable amount for the student and family to contribute from currently available resources toward the student's postsecondary education.

Additional family contribution or unmet need: Equal to total cost (see above) minus total aid subject to EFC limitations minus EFC. Negative values were set to zero. Total aid subject to EFC limitations includes Pell grants, Stafford loans, federal campus-based aid, and any other grant aid. It does not include SLS and PLUS loans that may be used to finance EFC. This variable can be interpreted as the amount students and their families must finance in addition to the EFC to meet estimated costs of attendance and student living.

¹ The participation rate of adults aged 17 or older was determined by their involvement in one or more of six

types of adult education activities in the 12 months prior to the interview; therefore, percentages may not add to totals because people participated in more than one type of activity (9 percent). Adults who participated in apprenticeship programs and English as a Second Language programs were included in the total, but are not shown separately. Adults who reported that they had participated only as full-time credential seekers are not included in the calculation of the participation rates.

² Only adults who had not received a high school diploma or equivalent, who had received a high school diploma in the past 12 months, or who had received a high school diploma in a foreign country were asked about their participation in the basic education/General Educational Development (GED) activities.

³ Includes adults whose highest education level was grades 9–12 who had not received a high school diploma.

⁴ Individuals with a bachelor's degree or higher were not asked about their participation in adult basic skills programs, GED preparation classes, adult high school, or high school equivalency programs.

⁵ Percentages less than 0.05 are rounded to 0.0.

65 and older	3.9	16.8	14.1	10.9	49.9	21.5	0.0

* Includes adults whose highest education level was grades 9–12 who had not received a high school diploma.

NOTE: Information on the type of provider of adult education activities was aggregated as follows: Elementary/secondary: elementary, junior high school, or high school; Postsecondary: 2-year community or junior college, 2-year vocational school, or 4-year college or university; Trade organization: private vocational, trade, business, hospital, or flight school, and adult learning center; Private: private community organization, church or religious organization, tutor, or private instructor; Business: business or industry or professional association; and Government: federal, state, county, or local government, or public library. Percentages were based on individuals who participated in work-related activities only. Because individuals may take more than one work-related adult education course, details may add to more than 100 percent.

Table 15-1 Explanations of levels of mathematics proficiency

Level 350: Multi-step problem solving and algebra	Students at this level can apply a range of reasoning skills to solve multi-step problems. They can solve routine problems involving fractions and percents, recognize properties of basic geometric figures, and work with exponents and square roots. They can solve a variety of two-step problems using variables, identify equivalent algebraic expressions, and solve linear equations and inequalities. They are developing an understanding of functions and coordinate systems.
Level 300: Moderately complex procedures and reasoning	Students at this level are developing an understanding of number systems. They can compute with decimals, simple fractions, and commonly encountered percents. They can identify geometric figures, measure lengths and angles, and calculate areas of rectangles. These students are also able to interpret simple inequalities, evaluate formulas, and solve simple linear equations. They can find averages, make decisions on information drawn from graphs, and use logical reasoning to solve problems. They are developing the skills to operate with signed numbers, exponents, and square roots.
Level 250: Numerical operations and beginning problem solving	Students at this level have an initial understanding of the four basic operations. They are able to apply whole number addition and subtraction skills to one-step word problems and money situations. In multiplication, they can find the product of a two-digit and a one-digit number. They can also compare information from graphs and charts, and are developing an ability to analyze simple logical relations.
Level 200: Beginning skills and understandings	Students at this level have considerable understanding of two-digit numbers. They can add two-digit numbers, but are still developing an ability to regroup in subtraction. They know some basic multiplication and division facts, recognize relations among coins, can read information from charts and graphs, and use simple measurement instruments. They are developing some reasoning skills.
Level 150: Simple arithmetic facts	Students at this level know some basic addition and subtraction facts, and most can add two-digit numbers without regrouping. They recognize simple situations in which addition and subtraction apply. They also are developing rudimentary classification skills.

Note on NAEP cohorts

The NAEP mathematics and science trend assessments included in this volume report trends in the progress of students by age. Proficiencies are reported for ages 9, 13, and 17. The modal grades for these age groups are 4th, 8th, and 11th grades, respectively. In both subjects, it would appear that the time span between the youngest and middle age group is greater than that between the middle and oldest age group. However, the way age is defined (on a calendar or fiscal year basis) and the time at which each age is assessed (fall, winter, or spring) results in the same length of time (or years of school) between the three age groups. A discussion of this methodology follows.

Age is determined on a calendar year basis for 9- and 13-year-olds, but on a fiscal year basis for 17-year-olds. In other words, the mathematics and science scores in 1992 represent students born in 1982 (9-year-olds), students born in 1978 (13-year-olds), and students born between October 1, 1974 and September 30, 1975 (17-year-olds). In addition to different age definitions, the time of the school year in which the assessment is administered varies across age levels: 9-year-olds are tested in the winter; 13-year-olds are tested in the fall; and 17-year-olds are tested in the spring

for both assessments. Since 9-year-olds are tested between January and February of the year in which they turn 10, and 13-year-olds are tested between October and December of the year in which they turn 13, the 13-year-olds have had almost $3\frac{3}{4}$ years more of school than the 9-year-olds.

Likewise, since 17-year-olds are tested between March and May, they will be between $16\frac{1}{2}$ and $17\frac{1}{2}$ at the time of the assessment (the difference is due to age being determined on a fiscal year basis); thus, they have had about $3\frac{3}{4}$ more years of school than the 13-year-olds.

These various methods of determining a student's age and the various testing times have been adopted in order to measure a uniform period of growth among the three age/grade groups. Comparing age cohorts over time can be more problematic, however. Nine-year-olds in 1988 generally represent the same age cohort as 13-year-olds in 1992, two points in time not quite 4 years apart. However, the 17-year-olds tested in 1992 were generally younger than the 1988 13-year-old age cohort was in 1992. Therefore, care must be taken when examining student cohorts across assessments in different years.

Table 16-1 Explanations of levels of science proficiency

Level 350: Integrates specialized scientific information

Students at this level can infer relationships and draw conclusions using detailed scientific knowledge from the physical sciences, particularly chemistry. They also can apply basic principles of genetics and interpret the societal implications of research in this field.

Level 300: Analyzes scientific procedures and data

Students at this level can evaluate the appropriateness of the design of an experiment. They have more detailed scientific knowledge, and the skill to apply their knowledge in interpreting information from text and graphs. These students also exhibit a growing understanding of principles from the physical sciences.

Level 250: Applies general scientific information

Students at this level can interpret data from simple tables and make inferences about the outcomes of experimental procedures. They exhibit knowledge and understanding of the life sciences, including a familiarity with some aspects of animal behavior and of ecological relationships. These students also demonstrate some knowledge of basic information from the physical sciences.

Level 200: Understands simple scientific principles

Students at this level are developing some understanding of simple scientific principles, particularly in the life sciences. For example, they exhibit some rudimentary knowledge of the structure and function of plants and animals.

Level 150: Knows everyday science facts

Students at this level know some general scientific facts of the type that could be learned from everyday experiences. They can read simple graphs, match the distinguishing characteristics of animals, and predict the operation of familiar apparatus that work according to mechanical principles.

^{*} Schools in French-speaking Belgium only, students instructed in Flemish or German were excluded.

[†] Students in government Native Indian schools were excluded.

[‡] Students in special schools for disabled students and institutions for specially talented students were excluded.

[†] Swedish-speaking, special education, and laboratory schools were excluded.

[‡] Private schools were excluded (16 percent).

[†] International schools, ESE Foundation schools, schools not participating in Secondary School Places

Allocation System (SSPA), and schools with class size of less than 20 were excluded.

[†] Very small schools in remote areas and non-graded schools were excluded.

[‡] Schools where there were fewer than 5 students were excluded.

[†] Schools outside of Java, Riau (Sumatra), and East Nusa Tenggara were excluded (30 percent of target population).

[‡] Private schools and schools with fewer than 5 students were excluded.

[†] Non-government schools were excluded.

[†] Schools for Lapps were excluded.

[‡] Students from schools with fewer than 10 students in the defined grade and from schools where the medium of instruction was not Castilian Spanish were excluded.

[†] Students in eligible schools not capable of taking the test (5 percent) were excluded.

[‡] Students attending private rural schools were excluded.

[†] Students in special schools for disabled students and non-graded private schools were excluded.

Note on definitions of literacy scales and levels

This indicator reports the results of a wide-ranging test of literacy skills given to a large sample of adults (ranging from 1,500 to 1,800 per country) in Europe and North America in fall 1994. The International Adult Literacy Survey (IALS) was a collaborative effort among seven governments and three intergovernmental organizations. Each country was required to draw a probability sample that could be representative of the civilian, non-institutionalized population aged 16–65. In six countries, the survey was conducted in the national language; in Canada, respondents were given a choice of taking the survey in either English or French; in Switzerland, respondents in French-speaking and German-speaking cantons responded to survey questions in their respective languages.

As literacy cannot be narrowed down to a single skill suited for dealing with all types of text, nor defined as an infinite set of skills, the IALS defined literacy in terms of three scales, each encompassing a common set of skills relevant for diverse tasks:

Prose literacy: The knowledge and skills required to understand and use information from texts, including editorials, news stories, poems, and fiction;

Document literacy: The knowledge and skills required to locate and use information contained in various formats, including job applications, payroll forms, transportation schedules, maps, tables, and graphics; and

Quantitative literacy: The knowledge and skills required to apply arithmetic operations, either alone or sequentially, to numbers embedded in printed materials, such as balancing a checkbook, figuring a tip, completing an order form, or determining the amount of interest on a loan from an advertisement.

In each of these three scales, rather than expressing a threshold for achieving literacy, a scale from 0–500 was constructed, upon which tasks of varying difficulty were placed. These scales were developed through the item response theory (IRT) scaling procedures. First, the difficulty of tasks was ranked on a scale according to how well respondents actually performed. Then, each scale was divided into five levels, reflecting the empirically determined progression of information-processing skills and strategies. Next, individuals were assigned scores between 0 and 500 according to how well they performed on a variety of tasks at different levels. Finally, the percentage of readers falling into each skill level was calculated.

A person's ability in each literacy scale can be expressed by a score, defined as the point at which he or she has an 80 percent chance of successfully performing a given task. If a person scores at level 2, it means that this individual has an 80 percent chance of successfully performing level 2 tasks and a greater than 80 percent chance of performing level 1 tasks. It does not mean, however, that individuals with low proficiency cannot succeed at tasks that are rated at higher skill levels—only that the probability of their success is relatively low. Below is a description of the three literacy scales and the tasks required at each proficiency level:

Prose literacy includes text from newspapers, magazines, and brochures accompanied by one or more questions or directives asking the reader to perform specific tasks. These tasks represent three major aspects of information processing: locating, integrating, and generating. Locating tasks require the reader to find information in the text based on conditions or features specified in the question or directive. Integrating tasks ask the reader to pull together two or more pieces of information in the text. Generating tasks ask the reader to produce a written response by processing information from the text, making text-based references, and drawing on back-ground knowledge.

Prose Level 1 (Difficulty values 0–225). Most of the tasks at this level require the reader to locate and match a single piece of information in the text that is identical to or synonymous with the information given in the directive. If a plausible incorrect answer is present in the text, it tends not to be near the correct information.

Prose Level 2 (Difficulty values 226–275). Tasks at this level tend to require the reader to locate one or more pieces of information in the text; however, several distracters may be present and the reader may need to make low-level inferences. Tasks at this level also begin to ask readers to integrate two or more pieces of information, or to compare and contrast information.

Prose Level 3 (Difficulty values 276–325). Tasks at this level tend to direct readers to search the text to match information, requiring the reader to make low-level inferences or to locate text that meets specified conditions. Sometimes the reader is required to identify several pieces of information that are located in different sentences or paragraphs rather than search for information located in a single sentence. Readers may also be asked to integrate or to compare and contrast information across paragraphs or sections of text.

Prose Level 4 (Difficulty values 326–375). These tasks require readers to perform multiple-feature matching or to provide several responses where the requested information must be identified through text-based inferences. Tasks at this level may also require the reader to integrate or contrast pieces of information that are sometimes presented in relatively lengthy texts. Typically, these texts contain more distracting information, and the information that is requested is more abstract.

Prose Level 5 (Difficulty values 376–500). Some tasks at this level require the reader to search for information in dense text that contains a number of plausible distracters. Some tasks require readers to make high-level inferences or use specialized knowledge.

Document literacy involves using materials such as tables, schedules, charts, graphs, maps, and forms. Questions or directives associated with the various document tasks are categorized into four basic types: locating, cycling, integrating, and generating. Locating, integrating, and generating refer to the same skills as those in prose literacy. Cycling tasks require the reader to locate and match one or more features of information, but differ from locating tasks in that they require the reader to engage in a series of feature matches to satisfy conditions given in the question.

Document Level 1 (Difficulty values 0–225). Most of the tasks at this level require the reader to locate a piece of information based on a literal match. Distracting information, if present, is typically located away from the correct answer. Some tasks may direct the reader to enter personal information onto a form.

Document Level 2 (Difficulty values 226–275). Document tasks at this level are more varied. While some still require the reader to match a single feature, more distracting information may be present, and the match may require a low-level inference. Some tasks at this level may require the reader to enter information onto a form or to cycle through information in a document.

Document Level 3 (Difficulty values 276–325). Tasks at this level appear to be the most varied. Some require the reader to make identical or synonymous matches; however, these matches usually require the reader to take conditional information into account or to match multiple features of information.

Document Level 4 (Difficulty values 326–375). Tasks at this level, like those in the previous levels, ask the reader to match multiple features of information, to cycle through documents, and to integrate information; frequently, these tasks require the reader to make higher order inferences to arrive at the correct answer. Sometimes the reader must take conditional information into account.

Document Level 5 (Difficulty values 376–500). Tasks at this level require the reader to search through complex displays of information that contain multiple distracters, make high-level inferences, process conditional information, or use specialized knowledge.

Quantitative literacy involves using numbers and arithmetic operations to complete a task. These tasks require the reader to locate and extract numbers from different types of documents that contain similar but irrelevant information, infer numbers from printed directions, or calculate numbers using multiple operations.

Quantitative Level 1 (Difficulty values 0–225). Although no quantitative tasks used in the IALS fall below the score of 225, experience suggests that such tasks would require the reader to perform a single, relatively simple operation (usually addition) for which either the numbers are already entered into the given document and the operation is stipulated, or the numbers are provided and the operation does not require the reader to borrow.

Quantitative Level 2 (Difficulty values 226–275). Tasks at this level typically require readers to perform a single arithmetic operation (frequently addition or subtraction) using numbers that are easily located in the text or document. The operation to be performed may be easily inferred from the wording of the question or the format of the material (for example, a bank deposit form or an order form).

Quantitative Level 3 (Difficulty values 276–325). Tasks at this level typically require the reader to perform a single operation. However, the operations are more varied—some multiplication and division tasks are found at this level. Sometimes two or more numbers are needed to solve the problem, and the numbers are frequently embedded in more complex displays. While semantic relation terms such as "how many" or "calculate the difference" are often used, some of the tasks require the reader to make higher order inferences to determine the appropriate operation.

Quantitative Level 4 (Difficulty values 326–375). With one exception, the tasks at this level require the reader to perform a single arithmetic operation in which the quantities or the operations are not easily determined. That is, for most of the tasks at this level, the question or directive does not provide a semantic relation term such as "how many" or "calculate the difference" to help the reader.

Quantitative Level 5 (Difficulty values 376–500). Tasks at this level require readers to perform multiple operations sequentially; the reader must pull out the features of the problem from the material provided or rely on background knowledge to determine the quantities or operations needed.

— Not available.

¹ Includes those in public and private schools.

² This figure represents high school graduates who took the SAT at any time while they were in high school as a percentage of all high school graduates.

³ Data have been revised from previously published figures.

⁴ Number of public high school graduates is based on state estimates.

NOTE: The first year for which SAT scores by racial/ethnic group are available is 1976. Data were not collected by racial/ethnic group in 1986. The term "college-bound seniors" refers to those students from each high school graduating class who participated in the College Board Admissions Testing Program, and does not include all first-year college students, or all high school seniors. See the supplemental note to this indicator for information on interpreting SAT scores.

¹The American College Testing (ACT) Program Assessment is used for college admissions, placement, scholarship programs, recruitment and retention, and academic advising.

²The ACT composite score ranges from 1 to 36 and reflects the scores of the 4 tests: English, Mathematics, Reading, and Science Reasoning.

³A college preparatory program is defined as one that includes the basic core curriculum of 4 years of English and 3 years each of mathematics, social studies, and science.

Note on interpreting SAT test scores and the new version of the SAT

Interpreting test scores

According to the College Board, the new version of the Scholastic Assessment Test (SAT) is designed to measure verbal and quantitative reasoning skills related to academic performance in college. SAT scores are statistically controlled to maintain the same meaning from year to year, and therefore useful comparisons over time can be made.

Since 1941, SAT scores have been expressed relative to the performance of a group of approximately 11,000 candidates who took the test in 1941. The mean raw score of that group was given the scaled score of 500, with a standard deviation of 100. In order for scores to be compared to this reference group, a short set of common items is included in each year's forms. Each new form is then linked with a previous form through these common items, allowing the forms to be equated back to the 1941 form. Therefore, a score of 500 on any form of the SAT corresponds to the mean of the 1941 group. Likewise, a score of 600 falls one standard deviation above the mean of the 1941 group, and a score of 400 falls one standard deviation below the mean of the 1941 group. The decline or rise of test scores depends on many factors. Changes can involve variations in the composition of the test-takers. For example, between 1963 and 1970, there was a significant decline in SAT scores. Because of a continuing increase in the proportion of high school graduates going to college over this period, the group of test-takers became progressively less selective, and this was likely a major factor in the decline in scores. The College Board notes that the relationship between SAT test scores and students' characteristics are "complex and interdependent." For example, educational, demographic, and socioeconomic factors might influence test scores. However, while these factors may be related, they are not necessarily causal. Moreover, changes in test scores can also be related to variations in performance among similar types of test-takers.

Standard deviation units

Performance on the SAT can be measured in a number of ways. Changes in standard deviation units is one useful metric. Standard deviation units indicate how scores, on average, deviated from the mean. Since the standard deviation is measured on a *common scale* across different tests, it can also be used to compare score changes on a variety of measures.

Once changes in scores across measures have been noted, the significance of these changes should be considered. Some have considered a decline of one standard deviation to be significant. This designation, however, is arbitrary. In *Investment in Learning*, Howard Bowen provides some guidelines for describing changes in standard deviation units (SDUs).

Estimated changes as expressed in SDUs

Descriptive judgment

+.75 or above	Extreme increase
+.40 to .74	Large increase
+.20 to .39	Moderate increase
+.10 to .19	Small increase
-.09 to +.09	No change
-.10 to -.19	Small decline
-.20 to -.39	Moderate decline
-.40 to -.74	Large decline
-.75 or below	Extreme decline

Changes in standard deviation units are calculated using the following formula:

$$\frac{\mu_1 - \mu_2}{\sqrt{\frac{1}{2}(\sigma_1^2 + \sigma_2^2)}}$$

where μ_1 and μ_2 are the mean scores in years 1 and 2, respectively, and σ_1 and σ_2 are the standard deviations of scores in years 1 and 2, respectively.

For example, table 22-1 indicates that between 1980 and 1985, mean verbal scores increased 7 points, and between 1980 and 1987, mean mathematics scores increased 10 points. Applying the above formula, the following standard deviation units are produced:

Verbal: $431-424/110.5 = +.063$

Math: $476-466/119.5 = +.084$

According to Bowen's template, the changes in standard deviation units suggest no significant change in scores during this period. Using the same calculation, the declines in verbal and mathematics scores from 1972 to 1993

were -.259 and -.050, respectively—moderate and not significant declines.

The new version of the SAT

A new version of the SAT was introduced in March 1994. The new SAT is divided into two sections—the SAT I: Reasoning Tests and the SAT II: Subject Tests. The SAT I is organized into verbal and mathematics sections similar to the previous version of the SAT, while the SAT II replaces the achievement tests for assessing knowledge in specific subject areas. Using psychometric methods of equating, the Educational Testing Service (ETS) made the scores from the SAT I comparable to the scores from the former SAT, thus allowing comparisons of scores from 1972 through 1995.

The mathematics section on the new SAT I is very similar to the mathematics section on the original SAT, except that it contains some grid-in

(or fill-in-the-blank) items, and test-takers can now use calculators. The verbal section of the new SAT I has changed more significantly, however. In the original SAT, students were asked to complete four types of items: reading comprehension, sentence completion, analogies, and antonyms. On the new version, students must complete only three types of verbal items: critical reading, sentence completion, and analogies. As a result of these changes, the new SAT I does not provide verbal subscores comparable to the subscores of the original SAT; however, the overall verbal scores are comparable between the two versions of the test.

Note on proficiency scores for IAEP mathematics and science

Indicators 23 and 24 contain mean proficiency scores and standard errors for each population participating in the second International Assessment of Educational Progress (IAEP). Proficiency scores allow the comparison of average proficiency across age groups within and between countries. Mean proficiency scores and standard errors were obtained following a series of different statistical analyses: item parameters estimation using item response theory (IRT), vertical equating of scales for 9- and 13-year-olds, and plausible values technology for estimation of proficiency distributions.

First, for each age group in mathematics and science, a random sample of 200 students was drawn from each participating population to build a reference population. Then, a three-parameter logistic item response model was fitted using this reference population. Following examinations of goodness of fit statistics and consultation with content specialists, no items were excluded from the item parameter estimation.

Since there were some common items for 9- and 13-year-olds, it was possible to equate item parameter estimates to put proficiency scores for these two age groups on the same proficiency scale. This was done with a linear transformation of the 9-year-olds' item parameters estimates using the 13-year-olds' item parameters estimates as the target scale. Finally, five draws from each

student's proficiency distribution were obtained using plausible values technology developed for the National Assessment of Educational Progress (NAEP). This technology used three different sets of values as input: item parameters estimates from the reference population, students' item mathematics or science responses, and students' answers to the background questions.

The proficiency scores were rescaled to give a mean of 500 and a standard deviation of 100. To do so, the proficiency scores for all the participating populations were merged, 9- and 13-year-olds together. An overall mean and an overall standard deviation were then calculated using the individual students' weights. These values were used to transform linearly the five proficiency scores of each student on the targeted scale with mean and standard deviation as previously fixed (500 and 100, respectively).

Population mean proficiency scores were computed as the average of the five proficiency score means.

Computation of standard errors of these means included contribution from two sources. A first contribution made use of the sampling plan and consisted of the jackknifed standard error of the first proficiency score. A second contribution was linked to the variation implicit in the presence of five possible proficiency scores. These two quantities were combined to give information concerning the variability of the results.

Note on educational attainment

The Current Population Survey (CPS), which is used for *Indicators 25, 32, 34*, and others, changed the questions used to determine a respondent's educational attainment beginning in 1992. Before 1992, the educational attainment questions were 1) "What is the highest grade or year of regular school...has ever attended?" and 2) "Did ...complete the grade?" There were 19 response categories for grades 1–8, 1st–4th year of high school, and 1st–6th year of college.

If respondents attended, for example, grade 12 but did not complete it, it was assumed that they had completed grade 11. If the highest grade respondents had completed was 9, 10, or 11, they were classified as high school dropouts. If the highest grade completed was 12 or greater, they were considered to have completed high school. If they had completed the 4th year of college or greater, they were considered to have completed college.

Beginning in 1992, the two questions were changed to a single question: "What is the highest level of school...has completed or the highest degree...has received?" In the new response categories, several of the lower levels were collapsed into a single summary category such as "1st, 2nd, 3rd, or 4th grades." At the high school level, a new category "12th grade, no diploma" was added. The biggest change was in the categories for high school completion and beyond, which are as follows:

- High school graduate, high school diploma or equivalent (e.g., GED)
- Some college but no degree
- Associate's degree in college, academic program
- Associate's degree in college, occupational or vocational program
- Bachelor's degree (e.g., B.A., A.B., B.S.)
- Master's degree (e.g., M.A., M.S., M.Eng., M.Ed., M.S.W., M.B.A.)
- Professional school degree (e.g., M.D., D.D.S., D.V.M., L.L.B., J.D.)
- Doctoral degree (e.g., Ph.D., Ed.D.)

The new question puts more emphasis on credentials received beginning at the high school level, and it puts less emphasis on the level attended or completed in college if that attendance did not lead to a credential.

This change created some uncertainty about the comparability of measures, such as high school completion rates and college completion rates over time. Below is a discussion of the possible effects the new question may have on high school and college completion rates.

High school completion: The earlier educational attainment question did not explicitly address high school equivalency certificates. Therefore, it is possible that an individual who attended grade 10, dropped out without completing it, and later took the GED test and received a high school equivalency credential would not have been counted as completing high school. The new question, however, explicitly treats these individuals as high school graduates. Since 1988, an additional question has been added to the October CPS to explicitly ask respondents whether they had taken the GED. The vast majority of those who responded "yes" were classified as high school graduates using the attainment question.

The earlier educational attainment question treated individuals who completed grade 12 as high school graduates. However, the new question added a new response category called "12th grade, no diploma," and these respondents were not treated as graduates. However, the number of individuals in this category historically has been very small. In summary, it appears that the question change has had minor effects on measured high school completion rates.

College completion: With the increasing prevalence of individuals taking more than 4 years to earn a bachelor's degree, some researchers are concerned that the college completion rate based on the category "4th year or higher of college completed" would overstate the bachelor's degree (or higher) completion rate. However, the college completion rates among those aged 25–29 in 1992 and 1993 using the new CPS question were very similar to the completion rates for those in 1990 and 1991 using the old questions. In summary, it appears that the question change has had a very small effect on measured college completion rates.

Some college: With the new question, someone who attends college for only a few months should respond "Some college," but with the old question they should have responded "Attended first year of college and did not complete it." In the past, the calculation of the percentage of the population with 1–3 years of college excluded these individuals. However, with the new question, the information to exclude them is not available, and those with only a few months of college are included in the category "Some college." So, in principle, the percentage of individuals with "Some college" or an associate's degree would be expected to be larger than the percentage with 1–3 years of college. Therefore, it does not appear useful to compare the percentage of those with "Some college or an associate's degree" using the new item, to the percentage of those who completed "1–3 years of college"

using the old item.

Indicators 32 and 34 use labor force statistics for the civilian population and annual median earnings for wage and salary workers with

different levels of educational attainment. The discussion above suggests that the "high school graduate with no further education" category based on the new item is larger than before, because it includes all those with an equivalency certificate; however, it is actually smaller than before because it excludes those who completed

"12th grade, no diploma" and those with only a few months of college. The latter group is now included in the "1-3 years of college" category.

Nevertheless, the employment and earnings of the respondents who have been added and dropped from each category are similar; therefore, the net effect of the misclassification on employment rates and average annual earnings is likely to be minor. For this reason, it was decided that it would be useful to continue to compare the employment rates and median annual earnings of recent cohorts with "Some college or an associate's degree" to older cohorts who completed "1-3 years of college."

For further information on this issue, see Robert Kominski and Paul M. Siegel, "Measuring Education in the Current Population Survey," *Monthly Labor Review*, September 1993.

Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1994,

1990, 1987, and 1982 High School Graduates, 1996.

Note on high school transcript studies

Indicators 28 and 29 contain data from high school transcript studies conducted by the National Center for Education Statistics (NCES). Data on average course credits, or Carnegie units, for high school graduates come from the following studies: 1987, 1990, and 1994 data are from the 1987, 1990, and 1994 National Assessment of Educational Progress (NAEP) High School Transcript Studies; and 1982 data are from the High School and Beyond (HS&B) Transcript Study. A brief description of these studies, including descriptions of the sampled populations, follows.

The 1987, 1990, and 1994 NAEP High School Transcript Studies were conducted using nearly identical methodology and techniques. The sample of schools was a nationally representative, and included schools having grade 12 or 17-year-old students. The sample was also representative of graduating seniors from each school.

Since the focus of the transcript studies was high school graduates, schools with 17-year-olds, but without 12th grade were not included in the subsample used in these analyses. Of the remaining schools, only those students who graduated were selected.

Between May and November of 1994, high school transcripts were collected from 25,573 students who graduated in 1994. To be consistent with the 1982 study, students with an Individualized Education Program (IEP) were omitted from all estimates in the tables. Also, students with incomplete transcripts were dropped, bringing the number of transcripts analyzed to 24,374. These students attended 340 schools that had previously been sampled by the NAEP.

In spring 1991, transcripts were collected from 21,607 students who graduated from high school in 1990. These students attended 330 schools that had previously been sampled for the NAEP.

The sample of schools for the 1987 High School Transcript Study consisted of a nationally representative sample of 497 secondary schools selected for the 1986 NAEP for grade 11, 17-year-old students, of which 433 schools participated. The 1987 study was restricted to students who were in grade 11 during the 1985–86 school year. There are 27,732 graduates from 1987 represented in the tables. Data for 1987, 1990, and 1994 in *Indicators 28 and 29* are from the NCES publication *The 1994 High School Transcript Study Tabulations*.

High School and Beyond (HS&B) is a survey of high school sophomores and seniors. In 1982, high school transcripts were collected for members of the sophomore cohort who were selected to be in the second follow-up survey (about 12,000 transcripts). As in the 1987, 1990, and 1994 NAEP High School Transcript Studies, records were obtained from all types of high schools. However, because the 1982 HS&B used a different method of identifying disabled students than the NAEP High School Transcript Studies, students who had participated in a special education program were excluded from the tabulations in order to make the figures consistent.

Each of the transcript studies used the taxonomy of Classification of Secondary School Courses (CSSC), which contains approximately 2,200 course codes used to define course content and level. These studies also included additional course and student information, such as grade and credit received, grade level, graduation status, age, gender, and race/ethnicity.

The numbers in all the tables differ from previous editions of *The Condition of Education* for two reasons. First, a new exclusionary rule was applied to the transcripts this year. Each year the transcripts must be examined for validity and completeness. Incomplete transcripts, those of students receiving special education diplomas, or those from schools which have unique definitions of credit hours were excluded. In previous years, transcripts showing that a student had taken more than 32 credit hours were excluded based on the supposition that their schools must be using shorter class periods than other schools, and thus one credit hour would not mean the same thing in these schools as in the average school. A case-by-case analysis of these schools showed that their class periods were no shorter than the average school; instead, these schools had particularly stringent graduation requirements. Therefore, the data for all years were recalculated to include these transcripts.

Second, in previous editions of *the Condition*, students who had taken algebra II or beyond in high school but had not taken algebra I or geometry were assumed to have taken these courses prior to entering high school and were included in the percentage of students who had

taken these courses. This year, the numbers reflect only those students who took these courses *while in high school*. The numbers for these two subjects appear to have dropped from previous years, but in actuality, only the number of students who were included in the analysis has dropped.

¹ Numbers were revised from previously published figures.

² These data only report the percentage of students who earned credit in each mathematics course while in high school and do not count those students who took these courses prior to entering high school. In 1992, for example, approximately 93 percent of students had taken algebra I at some point before graduating high school, either before or during high school, and about 70 percent had taken geometry.

³ Percent is less than 0.05 and is rounded to 0.0.

1993	64.2	67.6	60.6	46.9	61.6	30.1
1994	64.2	70.4	57.7	42.9	58.2	27.1

NOTE: Recent high school graduates are individuals aged 16–24 who graduated during the survey year. Recent school dropouts are individuals aged 16–24 who did not graduate and who were in school 12 months earlier, but who were not enrolled during the survey month. Due to a change in data sources, some percentages are revised from previously published figures.

Note on labor force statistics

The Bureau of Labor Statistics (BLS) uses three categories to classify the labor force status of an individual: employed, unemployed, and not in the labor force.

An *employed* individual is someone with a job and who is working. Also included are those individuals who are not working, but who have jobs from which they are temporarily absent due to illness, vacation, labor-management disputes, bad weather, and personal reasons. Those who are in the military are also counted as employed.

An *unemployed* individual is someone who has no job, but who is available for work, and who has made specific efforts to find employment some time during the prior 4 weeks. Also included are those persons waiting to be recalled to a job from which they had been laid off, or who are waiting to report to a new job within 30 days. Individuals who are neither employed nor unemployed are *not in the labor force*.

The *labor force* is made up of all persons classified as employed or unemployed. The *unemployment rate* represents the number of unemployed individuals as a percentage of those in the labor force. The *labor force participation rate* is the ratio of those in the labor force to the population. The *employment-population ratio* is the percentage of employed individuals in the population. *Indicator 32* refers to this last statistic as the *employment rate*.

Each of these statistics is typically reported in two forms: one that includes those in the military and one that excludes them. For instance, the *civilian employment-population ratio* is the percentage of all employed civilians in the civilian non-institutional population. The *civilian labor force participation rate* is the ratio of the civilian labor force to the civilian non-institutional population. The labor force statistics reported in *Indicator 32* and its associated supplemental tables are for the civilian non-institutional population. *Indicator 32* reports the form that excludes those in the military.

Each of these measures can be computed for groups classified by age, sex, race/ ethnicity, etc.

When classifying the labor force status of an individual, it is necessary to define: full-time, part-time, year-round, involuntary, and voluntary workers.

Full-time workers are those who reported being employed for 35 or more hours per week (including self-employment); this number may either be hours worked during the survey reference week or during the usual hours worked in the previous calendar year (*Indicator 33*). Included in this minimum 35 hours per week are paid leave for illness, vacation, holidays, and other paid time off. *Part-time workers*, in contrast, are those who are employed 1–34 hours per week.

Year-round workers are those who worked 50 or more weeks during the previous calendar year, while *part-year workers* are those who worked 1–49 weeks. Paid vacation time and sick leave count as time worked.

The distinction between whether an individual's employment status was *involuntary* or *voluntary*, as shown in *Indicator 33*, is made based on the main reason the individual gave for that status. For example, individuals who worked part time and who gave as the reason for working part time "could find only part-time job" or "slack work/materials shortage" were considered to have not chosen to work part time and therefore, were placed in the involuntary category. Those who worked less than year round were designated as involuntary status if their main reason for working part year was "no work available" or "ill or disabled," while others were categorized as voluntary if their main reason was "taking care of home or family," "going to school," or being "retired." Those who didn't work at all during the previous calendar year were categorized as involuntary if their main reason for not working was "ill or disabled" or "could not find work."

Additional details on these labor force statistics are available in the explanatory notes of *Employment and Earnings*, published monthly by the U.S. Department of Labor, Bureau of Labor Statistics.

Table 34-2 Median annual earnings (in 1995 constant dollars) of wage and salary workers aged 25–34 whose highest education level was a high school diploma, by sex and race/ethnicity: 1970–94

¹ Beginning in fall 1980, data include estimates for the expanded universe of private schools.

² Includes kindergarten and some nursery school students.

³ Revised from previously published figures.

⁴ Estimates based on preliminary data.

NOTE: The private school enrollment figures for years 1971–75, 1979, 1981–82, 1984, and 1986 are estimated. The 1987 private school enrollment numbers are taken from the Private School Survey. Private school enrollment figures for grades K–8 and 9–12 for the years 1988–93 are estimated from the K–12 totals. Projections are based on data through 1993.

Enrollment figures may not add to totals due to rounding.

*Revised from previously published figures.

*Preliminary data.

NOTE: Increases in enrollments in private 2-year institutions during 1980 and 1981 reflect the addition of schools accredited by the National Association of Trade and Technical Schools. Because of a revision in data compilation procedures, FTE figures for 1986 and later years are not directly comparable with data for earlier years.

^a Includes students who were served under Chapter 1 of the Elementary Consolidation and Improvement Act (ECIA) and Part B of the Individuals with Disabilities Education Act (IDEA).

^b Includes preschool children aged 3-5 and 0-5 who were served under Chapter 1 and Part B of the IDEA, respectively.

^c Prior to the 1987-88 school year, preschool disabled students were included in the counts by disabling condition.

Beginning in the 1987-88 school year, states were no longer required to report preschool students (aged 0-5) with disabilities by disabling condition.

^d Revised from previously published figures.

NOTE: Counts are based on reports from the 50 states and the District of Columbia only (i.e., figures from the U.S. territories are not included). Increases since 1987-88 are due in part to new legislation enacted in fall 1986, which mandates public school appropriate education services for all disabled children aged 3-5. Details may not add to totals due to rounding.

Note on teaching workload of full-time postsecondary faculty

The 1988 National Survey of Postsecondary Faculty (NSOPF) was a survey of faculty who had at least some instructional duties (such as teaching one or more courses) in for-credit, higher education courses during the fall 1987 term.

Unlike NSOPF-88, which was limited to faculty whose regular assignments included instruction, the faculty universe for NSOPF-93 was expanded to include anyone who was designated as faculty, whether or not their responsibilities included instruction, as well as other (non-faculty) personnel with instructional responsibilities. For the purposes of *Indicator 49*, analysis was restricted to full-time faculty who taught at least one class for credit. *Indicator 50*, however, uses classes taught by both full-time and part-time faculty who taught at least one class for credit. Teaching assistants were excluded from both analyses.

These analyses includes all those who had any instructional duties in the fall of 1987 and 1992. Therefore, it includes those faculty whose principal activity that semester was research, technical, clinical, service, or administration, as long as the faculty member taught at least one class for credit. In fact, in fall 1992, 15 percent of all faculty who taught at least one class for credit had a principal activity other than teaching.

The analysis for this indicator categorizes institutions of higher education into five types, as shown below.

Remaining institutions, such as religious or specialized institutions, were included in the totals but are not shown separately.

Types of institutions

Research university: Institution among the 100 leading universities that receives federal research funds. Each of these universities awards substantial numbers of doctorates across many fields.

Doctoral university: Institution that offers a full range of baccalaureate programs and Ph.D. degrees in at least three disciplines, but tends to be less focused on research and receives fewer federal research dollars than the research universities.

Comprehensive institution: Institution that offers liberal arts and professional programs. The master's degree is the highest degree offered.

Liberal arts institution: Institution that is smaller and generally more selective than comprehensive colleges and universities. A liberal arts institution primarily offers bachelor's degrees, although some offer master's degrees.

2-year institution: Institution that offers certificate or degree programs through the Associate of Arts level. Two-year institutions, with few exceptions, offer no bachelor's degrees, although some offer master's degrees.

Time allocation

NSOPF survey respondents were asked to estimate the percentage of total working hours they spent on each of the activities below:

Teaching: Includes teaching; grading papers; preparing courses; developing new curricula; advising or supervising students; or working with student organizations or intramural sports.

Research/scholarship: Includes conducting research; reviewing or preparing articles or books; attending or preparing for professional meetings or conferences; reviewing proposals; seeking outside funding; giving performances or exhibitions in the fine or applied arts; or giving speeches.

Professional growth: Includes taking courses or pursuing an advanced degree or other professional development activities to remain current in their field of practice.

Administration: Performing administrative activities.

Outside consulting or freelance work: Conducting outside consulting or other employment.

Service/other: Includes providing legal or medical service or psychological counseling to clients or patients; providing paid or unpaid community or public service, or service to professional societies/associations, or participating in other activities or work not listed above.

Classroom and student contact hours

Classroom hours: The number of hours per week faculty members spent teaching.

Student contact hours: The sum of the number of hours per week faculty members spent teaching over all classes, multiplied by the number of students in each class.

Class size: The total number of student contact hours divided by the mean number of classroom hours faculty spent per week.

Course divisions

Undergraduate, lower division courses: Courses designed for students in the first or second year of a 4-year bachelor's degree program.

Undergraduate, upper division courses: Courses designed for students in the third or fourth year of a 4-year bachelor's degree program.

Graduate courses: Courses designed for students in a post-baccalaureate degree program, including a master's or

doctor's program.

Medical faculty

For the purposes of this indicator, medical institutions and their faculty, as well as medical faculty at other institutions, were excluded from the analysis.

Note on calculation of the national index of public effort to fund education

There are many indices of public investment in education available. Choosing the most appropriate measure has been an issue among international comparisons as well as national trends. The national index of public effort provides a measure of public investment for each student, compared to available societal resources.

Public education revenues per student are the ratio of total public education revenues to public and private enrollment. Per capita income is the ratio of total personal income to total population; personal income is for the calendar year in which the school year began; and total population is as of July 1, the year in which the school year began. The index can be expressed algebraically, therefore, as a function of four variables:

or

$$\text{National effort index} = \frac{\text{Public education revenues per student}}{\text{Per capita income}} \times 100$$

$$\text{National effort index} = \frac{\text{Public education revenues} / \text{Total personal income}}{\text{Total enrollment} / \text{Total population}} \times 100$$

Revenue data from elementary/secondary and higher education are based on different accounting systems and are not entirely comparable. For example, elementary and secondary public revenues represent additions to assets (cash) from taxes, appropriations, and other funds, which do not incur an obligation that must be met at some future date (loans) in all public schools. These include revenues that are spent on construction of buildings and other investments in the physical plant. Because of the difficulty in constructing a comparable time series, public funds going to private schools (for Head Start, disabled children, etc.) have been excluded. For higher education, educational and general public revenues are those available from public sources at both public and private institutions for the *regular or customary activities* of an institution that are a part of, contributory to, or necessary to its instructional or research programs. These include salaries and travel funds for faculty and administrative or other employees; purchase of supplies or materials for *current* use in classrooms, libraries, laboratories, or offices; and operation and maintenance of the educational plant. In contrast to elementary/secondary public revenues, higher education public revenues, as defined in this indicator, do not include public funds that would be used for expansion of the physical plant. As a result, the reader should focus on the changes over time in the elementary/secondary and the higher education measures rather than on comparisons across all levels.

Enrollment includes all institutions, regardless of control. No adjustments were made for part-time enrollment. Total education revenues were adjusted from current school dollars, using the Consumer Price Index (CPI), prepared by the U.S. Department of Labor, Bureau of Labor Statistics. Personal income was adjusted from current calendar year dollars into 1995 constant dollars.

Alternative approaches to calculating adjusted costs and expenditures can be found in the following publications:

Halstead, Kent. *Inflation Measures for Schools, Colleges, and Libraries: 1995 Update*. Washington, D.C.: Research Associates of Washington, September, 1995.

Rothstein, Richard, with Karen Hawley Miles (1995). *Where's the Money Gone?* Washington, D.C.: Economic Policy Institute, (1995).

Note on international comparisons of current public education expenditures

The purpose of this indicator is to compare *public* support for education, relative to Gross Domestic Product (GDP), population, and school enrollment, across the developed countries for which data are available.

Definitions

Public education expenditures include funds provided to both public and private schools by federal, state, and local governments either directly or through students. This includes expenditures at public schools funded by public sources and subsidies to students at private schools from government agencies.

Private education expenditures are expenditures financed by private sources—households, private nonprofit institutions, businesses, and corporations. For example, this includes expenditures supported by public and private school tuition and fees, and expenses for books and materials that must be purchased by the students themselves.

Current expenditures are expenditures for educational goods and services whose life span should not in principle exceed the current year (salaries of personnel, school books and other teaching materials, scholarships, minor repairs and maintenance to school buildings, administration, and so on). Current expenditures exclude both capital expenditures (construction of buildings, major repairs, major items of equipment, vehicles) and the service debt.

This indicator focuses on the portion of current education expenditures at both public and private schools funded by public sources.

Expenditures in the United States

Elementary and secondary education

For the United States, *current public expenditures for elementary and secondary education* include current expenditures in local public school districts funded by state and local taxes, federal programs administered by the U.S. Department of Education (ED), and federal programs operated outside of ED that are not administered by state or local education agencies, e.g., Head Start, Department of Defense Schools, and schools operated by the Bureau of Indian Affairs.

Also included are federal expenditures to operate ED and other activities, such as research, statistics, assessment, and school improvement, and state expenditures to operate state departments of education and other direct state expenditures, including state schools for the deaf and blind and reform schools.

Some expenditures, such as those for federal or state agency administration and those for non-graded special education programs, cannot be assigned to particular grade levels by any obviously universally superior method. These expenditures defy strict grade-level categorizations. Like some other countries, the United States has chosen to prorate these expenditures over the grade levels based on the relative size of enrollments, staffing, and salaries. Other countries, however, have chosen not to allocate such expenditures, classifying them, instead, as "undistributed."

Higher education

Current public expenditures for higher education in the United States include expenditures at both public and private colleges and universities funded by federal, state, and local governments. The Integrated Postsecondary Education Data System (IPEDS), the core postsecondary education data collection program for NCES, gathers institutional reports for revenue received by both public and private institutions from both public and private sources. Current expenditures by public and private nonprofit institutions are separated into public and private expenditures based on the share of current fund revenues from federal, state, and local sources.

Most federal aid goes to students who then spend it on education (e.g., tuition) and non-education (room and board) services. It was assumed that 60 percent of federally administered Pell grants were spent on education by students.

With the exception of Pell grant money, public expenditures for less-than-2-year public and private institutions were not available; therefore, *current public expenditures for higher education* in the United States are biased downward. However, since the students participating in these institutions are also excluded from higher education enrollments, the estimate of *public expenditures per student* would be biased upward if the per-student public expenditures in less-than-2-year institutions were less than those in other higher education institutions.

Per student expenditures are calculated as current public expenditures divided by enrollment in both public and private schools. This is a measure of the average public investment per student in the education system, rather than a measure of the total resources each student receives, which would include private expenditures. For Germany, Japan, and the United States, private education expenditures are a significant portion of the GDP.

Total expenditures for education in 1992

Country	Percentage of GDP		
	Total	Public sources	Private sources

Canada	7.4	7.2	0.2
France	5.9	5.5	0.4
Former West Germany*	5.6	4.1	1.5
Italy	—	5.1	—
Japan	4.7	3.6	1.1
Spain	5.3	4.6	0.7
United Kingdom	—	5.2	—
United States	7.0	5.4	1.6

— Not available.

* Data for private sources from 1991.

NOTE: Data revised from previously published figures. *Total expenditures* include current expenditures, capital expenditures, and interest on debt service.

SOURCE: Organization for Economic Co-operation and Development, *Education at a Glance: OECD Indicators*, 1995, table F1 (B3).

How students are classified

The International Standard Classification of Education (ISCED) was designed as an instrument for presenting statistics of education internationally. Many countries report education statistics to UNESCO and the Organization for Economic Co-operation and Development (OECD) using the ISCED. In this classification system, education is divided into several levels.

The following are summary definitions used in this indicator:

- *Education preceding the first level (preprimary education)* where it is provided, usually begins at age 3, 4, or 5 (sometimes earlier) and lasts from 1–3 years. For the United States, this would be mostly nursery schools and kindergarten classes.
- *Education at the first level (primary education)* usually begins at age 5, 6, or 7 and lasts for about 5 or 6 years. For the United States, the first level starts with grade 1 and ends with grade 6.
- *Education at the second level (lower secondary education)* begins at about age 11 or 12 and lasts for about 3 years. For the United States, second level starts with grade 7 and ends with grade 9.
- *Education at the third level (upper secondary education)* begins at about age 14 or 15 and lasts about 3 years. For the United States, the third level starts with grade 10 and ends with grade 12.
- *Education at the fifth level (non-university higher education)* is provided at community colleges, vocational-technical colleges, and other degree-granting institutes whose programs typically take 2 years or more, but less than 4 years, to complete.
- *Education at the sixth level (university higher education)* is provided in undergraduate programs at 4-year colleges and universities in the United States and, generally, at universities in other countries. Completion of education at the third level (upper secondary education) is usually required as a minimum condition of admission, and admission is, in many cases, competitive.
- *Education at the seventh level (graduate and professional higher education)* is provided in graduate and professional schools that generally require a university diploma as a minimum condition for admission.
- *Education at the ninth level (undistributed)* is a classification reserved for enrollments, expenditures, or programs that cannot be unambiguously assigned to one of the aforementioned levels. Some countries, for example, assign non-graded special education or recreational non-degree adult education programs to this level. Other countries assign nothing to this level, preferring instead to allocate enrollments, expenditures, and programs to levels as best they can.

"Undistributed" expenditures are reported separately from other expenditures in tables 52-2 through 52-5. They are not included or allocated in any way in table 52-1. France, Germany, and Japan, among the G-7 countries, report some amount of expenditure as undistributed.

How expenditures are compared across countries

To compare public expenditures per student in the United States to expenditures per student in other countries, expenditures must be denominated in a common currency. Conversion of other countries' expenditures to U.S. dollars facilitates comparison with expenditures in the United States. There are at least two methods of conversion: 1) market exchange rates, and 2) Purchasing Power Parity Indices (PPPIs).

The market exchange rate is the rate at which an individual can exchange the currencies of two countries. It is determined by relative confidence in the governments, their monetary systems, and the economies of the two countries and by the relative demand for the goods and services that the two countries trade. Market exchange rates can be highly volatile.

PPPIs are calculated by comparing the cost of a fixed market basket of goods in each country. Changes over time

in a PPPI are determined by the rates of inflation in each country. Since PPPIs are not volatile, they were used here to adjust expenditure and GDP figures.

Because the fiscal year has a different starting month in different countries, within-country Consumer Price Indices (CPIs), calculated by the International Monetary Fund, were used to adjust educational expenditure data to allow for inflation between the starting month of the fiscal year and July 1, 1992. See supplemental table 51-5 for both the PPPIs used in this indicator and the CPI adjustment ratios.

Problems in comparing education expenditures across countries

The coverage and character of the education expenditure data that countries submit to the OECD vary somewhat. Sometimes an individual expenditure item may be included in the expenditure data from one country, but may not be included in those from another.

Discrepancies arise because one country may collect certain kinds of data that another country either does not collect, or does not collect in its "education" data collections. Or, one country may define what constitutes an "education" expenditure differently than another country does. Discrepancies between which expenditure items are included in one country's expenditure figures and not in another's tend to arise in three general domains:

Non-instructional (ancillary) services: Some countries provide fewer ancillary services in their schools and, thus, include fewer expenditures for such services in their education expenditure figures. Examples of ancillary services are school cafeterias; dormitories; intramural school sports programs; school health clinics or visiting school nurse services; attendance (i.e., truancy) services; and speech or psychological therapy services. U.S. schools tend to subsidize relatively more ancillary services through their education budgets than do schools in most other countries. In some countries (e.g., Germany), *none* of the aforementioned services are provided at the primary and lower secondary levels by many schools.

Private expenditures: Some countries' education systems receive large private contributions. The most common forms of private contributions to education are student tuition or fees; organizational subsidies, such as those provided by religious denominations to their own schools; and corporate in-kind contributions, such as those provided by German and Austrian firms to fund vocational courses on the shop floor for participating youth apprentices. Private expenditures have not been included in the indicators used in this report, in part because precise figures for private education expenditures are not available for the United States or for several other countries.

The boundaries of education: Fewer (though, still some) inconsistencies arise when comparing just the *instructional* expenditures for *primary* and *secondary* public education in the *academic* track. But, the "borderlands" of education, in particular, tend to cause comparability problems. These borderlands include preprimary education and day care, special education, adult education, vocational/technical education, and proprietary education. Some countries, for example, simply do not collect expenditure data for private "center-based" day care because they do not define this as "education." Indeed, in some countries, even public day care is not managed by education authorities; rather, it is the responsibility of human services departments.

The exact location of each "boundary" also varies from country to country and even within each country. In Canada, for example, vocational/technical students in Québec choose to enter vocational/technical college in the 12th grade, while in the other Canadian provinces with vocational/technical colleges, they enter in the 13th or 14th grade. Thus, vocational/technical students in the other provinces spend another year or two at the upper secondary level. The more time the average student spends in a level of education, the greater will be the expenditure at that level.

Even these three domains do not include all the possible comparability problems. There remain, for example, inconsistencies in how different countries treat public contributions to teacher retirement and fringe benefits, student financial aid, and university research and hospitals.

The National Center for Education Statistics (NCES) has sponsored two studies designed to examine the issue of the comparability of national figures on education expenditure. The studies, entitled *The International Expenditure Comparability Study* and *Improving the Comparability of International Expenditure Data*, involve 10 countries and examine in detail the content of their education expenditures as they are reported to the OECD.

Thus far, participating education ministries have been receptive to the idea of improving comparability in the OECD data collection. Indeed, some countries had already modified their data submissions to the OECD for the 1991-92 school year, thus improving the comparability of education expenditures across countries for the data collected used for this report. These changes were motivated in part by preliminary findings from the NCES expenditure comparability studies.

Table 53-2 Percentage distribution of educational and general expenditures of institutions of higher education per full-time-equivalent (FTE) student according to type of expenditure, by type of institution: Academic years ending 1977-93

¹ Includes institutional and academic support excluding libraries.

² Includes institutions with medical schools. Private doctoral-granting institutions with a medical school have substantially higher instructional expenditures per FTE student than those without a medical school.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars, and the CPI was used to forecast the HEPI to July 1995. Data in this table may differ slightly from data appearing in other tables. Data for academic years 1976-77 through 1985-86 include only institutions that provided both enrollment and finance data. See the supplemental note to *Indicator 51* for resources on alternative approaches to adjusting cost and expenditures.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Educational Statistics*, 1995, tables 335-339 (based on the IPEDS/HEGIS "Institutional Characteristics," "Financial Statistics," and "Fall Enrollment" surveys).

*Federally supported student aid received through students (e.g., Pell grants) is included under tuition and auxiliary enterprises.

*Includes institutions with medical schools. Private doctoral-granting institutions with a medical school have substantially different revenue income per FTE student than those without a medical school.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars, and the Consumer Price Index (CPI) was used to forecast the HEPI to July 1995. Data in this table may differ slightly from data appearing in other tables. Data for academic years 1976-77 through 1985-86 include only institutions that provide both enrollment and finance data. Details may not add to totals because of rounding. See the supplemental note to *Indicator 51* for resources on alternative approaches to adjusting cost and expenditures.

— Too few sample observations for a reliable estimate.

NOTE: Included in "total" and "other school composition" are other sources of income reported after excluding outside income. Data for this analysis were calculated from SASS School and Teacher Questionnaires; therefore, salaries shown here may not match other published figures. Excludes a small number of teachers whose schools did not respond to the questionnaire.

*It is easier to have majored, minored, or become certified in "science" than in a specific discipline, such as biology, because a teacher from any scientific field may qualify in "science," whereas a discipline requires a specific match.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993-94 (Teacher Questionnaire).

Note on definition of student percentages, certification in class subject, and major/minor in class subject

Indicator 57 reports the percentages of students taught by full-time teachers with different qualifications. These values were calculated from teacher survey information on the number of classes taught, number of students in each class, subject matter of each class, and teachers' education and certification. The information obtained from each teacher was weighted to properly represent national levels.

For example, we used the following procedure to calculate the percentage of mathematics students taught by certified mathematics teachers: First, for each full-time teacher who reported teaching a mathematics class, the weighted number of students in each class was summed to get an estimate of the total number of mathematics students taught by these teachers. Next, for each full-time teacher certified to teach mathematics, the weighted number of students in each mathematics class was summed to get an estimate of the number of mathematics students taught by certified teachers. The two estimates were then divided to obtain the estimated percentage of mathematics students taught by a full-time teacher certified in mathematics. The percentages reported in each of the tables in this analysis were calculated by limiting the selection to specific subjects and specific school and teacher characteristics.

There are many ways to match a major/minor field of study with class subjects. One method is to include both the general or specific field and the education major/minor parallel field as a match for a specific class subject. For example, a teacher who majored or minored in mathematics or mathematics education could be defined as having majored or minored in the subject of mathematics. A stricter definition would exclude the mathematics teachers who majored or minored in mathematics education. The more general definition is used for all the core subjects, including science, in all the tables in this analysis. The stricter definition is used for the specific science disciplines (biology, chemistry, and physics) in all tables.

Classes excluded from the text table and tables 57-1 through 57-5

Some classes are excluded because it was difficult to match each class subject matter to the appropriate major/minor, or because, in the case of computer science, a major in the field has existed for only a few years. The following subject matters were excluded from the tables in this analysis: computer science, driver education, religion, philosophy, and unspecified.

Certification in class subject

Certification, as defined here, includes advanced, standard, and probationary certification by a state or full certification by an accrediting body other than a state. Teachers with a temporary or emergency certification were classified as not certified in this analysis.

The table below shows teacher certifications classified by class subject. Teachers were classified as being certified in a class subject if they were certified in an assignment field (shown in the left-hand column) that corresponds to the subject matter listed in the right-hand column. Only certifications as defined above were considered as we matched subject matter.

industry, technical, other vocational/technical
education, home economics, journalism

Majored or minored in class subject

Teachers were classified as having majored or minored in the class subject if they majored or minored in a field (shown in the right-hand column) that corresponds to the class subject listed in the left-hand column. Both undergraduate and graduate level degrees were considered in determining if a match had occurred.

Class subject(s)

English

Social sciences

Mathematics

Natural sciences

 Biology/life science

 Chemistry

 Physics

Foreign languages

Visual and performing arts

Health, physical education

Vocational education

Major/minor field(s)

English, English education, reading education, humanities, English as a second language

Social studies/social sciences education, cross-cultural education, area and ethnic studies, psychology, public affairs, economics, history, political science and government, sociology, other social sciences

Mathematics, mathematics education, engineering, physics

Geology/earth science, science education, other natural sciences and majors listed below

Biology/life science

Chemistry

Physics

French, German, Latin, Russian, Spanish, other foreign languages, foreign language education, bilingual education, English as a second language

Art (fine and applied), art education, drama, theater, music, music education

Health professions and occupations, physical education/health education

Agricultural education, home economics education, industrial arts, vocational and technical, trade and industrial education, agricultural and natural resources, business and management, business, commerce, and distributive education, communications and journalism

Table 59-1 Percentage of teachers who participated in a formal teacher induction or a master or mentor program, by years of teaching experience and control and level of school: 1994

Control and level of school	Participated in a formal teacher induction program during first year of teaching			Master or mentor program
	1 year	2-3 years	4 years or more	
Public	59.9	54.8	23.3	11.3
Elementary	59.4	54.5	23.8	11.4
Secondary	60.7	55.3	22.5	11.3
Private	30.2	33.8	24.2	10.1
Elementary	26.8	31.7	23.5	8.9
Secondary	42.7	39.5	26.0	13.7

NOTE: Excludes a small number of teachers whose schools did not respond to the questionnaire.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993-94 (Teacher Questionnaire).

Table 59-2 Percentage of teachers who participated in professional development activities during the 1993–94 school year, by topic, type of support and activity, outcomes, and level, control and urbanicity of school

Topic, type of support and activity, and outcomes of professional development	Elementary teachers				Secondary teachers			
	Total	Central city	Urban fringe/ large town	Rural/ small town	Total	Central city	Urban fringe/ large town	Rural/ small town
Public								
In-service education or professional development topic

NOTE: Salaries are for full-time instructional faculty on 9- or 10-month contracts. Data for 1990–91 through 1993–94 include imputations for nonrespondent institutions. The Integrated Postsecondary Education Data System (IPEDS) is a universe survey of all institutions and may yield different faculty salaries than would a sample survey such as the National Survey of Postsecondary Faculty (NSOPF).

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics* (based on IPEDS/HEGIS "Salaries of Full-Time Instructional Faculty" surveys) various years.

Note on salaries of full-time postsecondary faculty

Sources of earned income

Basic faculty salary: Income received from the academic institution as indicated by the faculty respondent under a category called "basic salary."

Other income from the academic institution: Income including the estimated value of non-monetary compensation (e.g., food, housing, car) received for: administration, research, coaching, summer session teaching, or other activities not included in the basic salary.

Consulting income: Income received from sources other than the academic institution such as legal or medical services, psychological counseling, outside consulting, freelance work, professional performances or exhibitions, speaking fees, or honoraria.

Other outside income: Income received from sources other than the academic institution, including other academic institutions, self-owned businesses (other than consulting), royalties, commissions, non-monetary compensation from other sources, retirement income, grants or research income, or any other employment.

Total earned income: The sum of all of the above sources.

Types of institutions

Research university: Institution that is among the 100 leading universities receiving federal research funds. Each of these universities awards substantial numbers of doctorates across many fields.

Doctoral university: Institution that offers a full range of baccalaureate programs and PhD degrees in at least three disciplines, but tends to be less focused on research and receives fewer federal research dollars than the research universities.

Comprehensive institution: Institution that offers liberal arts and professional programs. The master's degree is the highest degree offered.

Liberal arts institution: Institution that is smaller and generally more selective than comprehensive colleges and universities. A liberal arts institution primarily offers bachelor's degrees, although some offer master's degrees.

2-year institution: Institution that offers certificate or degree programs through the Associate of Arts level and, with few exceptions, offers no baccalaureate degrees, although some offer master's degrees.

Note on the National Survey of Postsecondary Faculty (NSOPF)

In this analysis, medical institutions and their faculty, as well as medical faculty at other institutions, were excluded from the NSOPF portion of this analysis.

The NSOPF analysis includes full-time faculty who taught at least one class for credit. Teaching assistants and part-time faculty were not included in the estimates.

For more information on NSOPF, see the supplemental note to *Indicator 49*.

Standard Error Tables

General information about standard errors

The information presented in this report was obtained from many sources, including federal and state agencies, private research organizations, and professional associations. The data were collected using many research methods, including surveys of a universe (such as all school districts) or of a sample, compilations of administrative records, and statistical projections. Users of *The Condition of Education* should take particular care when comparing data from different sources. Differences in procedures, timing, phrasing of questions, interviewer training, and so forth mean that the results are not strictly comparable. Following the general discussion of data accuracy below, descriptions of the information sources and data collection methods are presented, grouped by sponsoring organization. More extensive documentation of procedures used in one survey as compared to another does not imply more problems with the data, only that more information is available.

Unless otherwise noted, all statements cited in the text were tested for statistical significance and are statistically significant at the .05 level. Several test procedures were used. Which procedure was used depended upon the type of data being interpreted and the nature of the statement being tested. The most commonly used test procedures were: 1) *t*-tests, 2) multiple *t*-tests with a Bonferroni adjustment to the significance level, 3) linear trend tests, and 4) sign tests. When a simple comparison between two sample estimates was made, for example, between the first and last years in a time series or between males and females, a *t*-test was used. When multiple comparisons between more than two groups were made, and even if only one comparison is cited in the text, a Bonferroni adjustment to the significance level was made to ensure the significance level for the tests as a group was at the .05 level. This procedure commonly arises when making comparisons between racial/ethnic groups and between the United States and other countries. A linear trend test was used when a statement describing a trend, such as the growth of enrollment rates over time, was made or when a statement describing a relationship, such as the relationship between a parent's educational attainment and a student's reading proficiency, was made. A sign test was used when a statement describing a consistent pattern of differences over the years was made.

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. In addition to such sampling errors, all surveys, both universe and sample, are subject to design, reporting, and processing errors and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures; however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

The estimated standard error of a statistic is a measure of the variation due to sampling and can be used to examine the precision obtained in a particular sample. The sample estimate and an estimate of its standard error permit the construction of interval estimates with prescribed confidence that the interval includes the average result of all possible samples. If all possible samples were selected, and each were surveyed under the same conditions, and an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the actual value; 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the actual value; and 99 percent of all intervals from 2.5 standard errors below the estimate to 2.5 standard errors above the estimate would include the actual value. These intervals are called 90 percent, 95 percent, and 99 percent confidence intervals, respectively.

To illustrate this further, consider the text table for *Indicator 1* and the standard error table S1 for estimates of standard errors from the Current Population Surveys (CPS). For the 1992 estimate of the percentage of 3-year-olds enrolled in school (27.7 percent), table S1 shows a standard error of 1.2. Therefore, we can construct a 95 percent confidence interval from 25.3 to 30.1 ($27.7 \pm 2 \times 1.2$). If this procedure were followed for every possible sample, about 95 percent of the intervals would include the actual percentage of 3-year-olds enrolled in school in 1992.

The estimated standard errors for two sample statistics can be used to estimate the precision of the difference between the two statistics and to avoid concluding that there is an actual difference when the difference in sample estimates may be due only to sampling error. The need to be aware of the precision of differences arises, for example, when comparing mean proficiency scores between groups or years in the National Assessment of Educational Progress (NAEP) or when comparing percentages between groups or years in the CPS. The standard error (se) of the difference between sample estimate A and sample estimate B (when A and B don't overlap) is:

When the ratio (called a *t*-statistic) of the difference between the two sample statistics and the standard error of the difference as calculated above is less than 2, one cannot be sure the difference is not due only to sampling error and caution should be taken in drawing any conclusions. In this report, for example, using the rationale above, we would not conclude that there is a difference between the two sample statistics. Some analysts, however, use the less restrictive criterion of 1.64, which corresponds to a 10 percent significance level.

To illustrate this further, consider the data on mathematics proficiency of Hispanic 17-year-olds in the 2nd text table for *Indicator 15* and the associated standard error table S15(b). The estimated average mathematics proficiency score for the sample of Hispanic 17-year-olds in 1990 was 284. For the (new) sample in 1992, the

estimated average was 292. Is there enough evidence to conclude that the actual average score for all Hispanic 17-year-olds increased 8 points between 1990 and 1992? The standard errors for these two estimates are 2.9 and 2.6, respectively. Using the above formula, the standard error of the difference is calculated as 3.9. The ratio of the estimated difference of 8 to the standard error of the difference of 3.9 is 2.05. Using the table below, we see that there is less than a 5 percent chance that the 8 point difference is due only to sampling error and one may conclude that the proficiency scores of Hispanic 17-year-olds grew between 1990 and 1992.

Percent chance that a difference is due only to sampling error:

t-statistic	1.00	1.64	1.96	2.57
Percent chance	32	10	5	1

It should be noted that most of the standard errors presented in this report and in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and that could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

$$se_{A-B} = \sqrt{se_A^2 + se_B^2}$$

1

The preceding discussion on sampling variability was directed toward a situation concerning one or two estimates. Determining the accuracy of statistical projections is more difficult. In general, the further away the projection date is from the date of the actual data being used for the projection, the greater the possible error in the projection. If, for instance, annual data from 1980 to 1994 are used to project enrollment in elementary and secondary education, the further beyond 1994 one projects, the more variability in the projection. The enrollment projection for the year 2001 will be less certain than the projection for 1996. A detailed discussion of the projections methodology is contained in *Projections of Education Statistics to 2006* (National Center for Education Statistics 1996).

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors can arise in various ways including: 1) from respondents or interviewers interpreting questions differently; 2) from respondents estimating the values that they provide; 3) from partial to total nonresponse; 4) from imputation or reweighting to adjust for nonresponse; 5) from inability or unwillingness on the part of respondents to provide correct information; 6) from recording and keying errors; or 7) from overcoverage or undercoverage of the target universe.

Sampling and nonsampling error combine to yield total survey error. Since estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available. In almost all situations, the sampling error represents an underestimate of the total survey error, and thus an overestimate of the precision of the survey estimates.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both partial and total. An adjustment made for either type of nonresponse is often referred to as an imputation—substitution of the "average" questionnaire response for the nonresponse. Imputations are usually made separately within various groups of sample members, which have similar survey characteristics. Imputation for item nonresponse is usually made by substituting for a missing item the response to that item of a respondent having characteristics that are similar to those of the nonrespondent. In editions prior to the 1992 edition of *The Condition of Education*, when reporting race-specific data from the CPS, Hispanics were usually included among whites and blacks (i.e., "Hispanics may be of any race"). Beginning with the 1992 edition of the report, racial/ethnic data from the CPS excludes Hispanics from whites and blacks (e.g., whites are non-Hispanic whites and blacks are non-Hispanic blacks). Unless otherwise noted, all dollar values in this volume are expressed in 1995 constant dollars. The Consumer Price Index (CPI) is used to convert current dollars for earlier years to 1995 dollars. The CPI index for calendar year 1995 is 152.7. See table 37 in *the Digest of Education Statistics, 1995* (National Center for Education Statistics 1995) for CPI adjustments.

How to obtain standard errors for the supplemental tables

To obtain estimates of standard errors for the statistics in the supplemental tables, please complete the reply card located in this edition of *The Condition of Education*.

Baccalaureate and Beyond Longitudinal Study

The Baccalaureate and Beyond Longitudinal Study (B&B) is based on the National Postsecondary Student Aid Study (NPSAS) and provides information concerning education and work experience after completing the bachelor's degree. B&B provides cross-sectional information 1 year after bachelor's degree completion (comparable to the Recent College Graduate Study), while at the same time provides longitudinal data concerning entry into and progress through graduate level education, and the work force. Also provides information on entry into, persistence and progress through, and completing of graduate level education information not available through followups involving high school cohorts or even college entry cohorts, both of which are restricted in the number who actually complete a bachelor's degree and continue their education. B&B will follow NPSAS baccalaureate degree completers for a 12-year period after completion, beginning with NPSAS:93. About 11,000 students who completed their degree in the 1992–93 academic year were included in the first B&B (B&B:93/94). In addition to the student data, B&B will collect postsecondary transcripts covering the undergraduate period, providing complete information on progress and persistence at both the undergraduate and graduate levels. New B&B cohorts will alternate with BPS in using NPSAS as their base. For additional information about B&B contact:

Beginning Postsecondary Students Longitudinal Study

The Beginning Postsecondary Students Longitudinal Study (BPS) provides information on persistence, progress, and attainment of students from their initial time of entry into postsecondary education through their leaving school and entering the work force. BPS includes traditional and nontraditional (e.g., older) students and is representative of all beginning students in postsecondary education. BPS follows first-time, beginning students for at least 6 years at 2-year intervals, collecting student data, postsecondary transcripts, and financial aid reports. By starting with a cohort that has already entered postsecondary education (from the NPSAS:90), and following it for 6 years (with the first followup in spring 1992 and the second followup in spring 1994), BPS is able to determine to what extent, if any, students who start postsecondary education later differ in their progress, persistence, and attainment.

Common Core of Data

The Common Core of Data (CCD) survey provides the National Center for Education Statistics (NCES) with a way to acquire and maintain statistical data on the 50 states, the District of Columbia, and five outlying areas from the universe of state-level education agencies. Information about staff and students is collected annually at the school, local education agency or school district (LEA), and state levels. Information about revenues and expenditures also is collected at the state level, and NCES joins the Bureau of Census in collecting school district finance data. Data are collected for a particular school year (October 1 through September 30) via survey instruments sent to the states by October 15 of the subsequent school year. States have 1 year in which to modify the data originally submitted.

Since the CCD is a universe survey, the CCD information presented in this edition of *The Condition of Education* is not subject to sampling error. However, nonsampling error could come from two sources—nonreturn and inaccurate reporting. Almost all of the states submit all CCD survey instruments each year, but there are many delays in submitting data and the submissions are sometimes incomplete.

Understandably, when 56 education agencies compile and submit data for over 85,000 public schools and approximately 15,000 local school districts, misreporting can occur. Typically, this results from varying interpretation of NCES definitions and differing recordkeeping systems. NCES attempts to minimize these errors by working closely with the state education agency representatives in the National Forum on Education Statistics and its state CCD coordinators.

The state education agencies report data to NCES from data collected and edited in the states' regular reporting cycles. NCES encourages the agencies to incorporate into their own survey systems the NCES items they do not already collect so that those items will also be available for the subsequent CCD survey. Over time this has

meant fewer missing data cells in each state's response, reducing the need to impute data. NCES subjects data from the education agencies to a comprehensive edit. Where data are determined to be inconsistent, missing, or out of range, NCES contacts the education agencies for verification. NCES-prepared state summary forms are returned to the state education agencies for verification. States are also given an opportunity to revise their state-level aggregates from the previous survey cycle.

Federal Support for Education

NCES prepares an annual compilation of Federal Funds for Education. Data for U.S. Department of Education program totals come from the *Budget of the U.S. Government*. Budget offices of other federal agencies provide information for all other federal program support except for research funds, which are obligations reported by the National Science Foundation in *Federal Funds for Research and Development*, fiscal years 1965 to 1992. Some data are estimated, based on reports from the federal agencies contacted and the *Budget of the U.S. Government*. Except for money spent on research, outlays were used to report program funds to the extent possible. Some tables are obligations, as noted in their titles. Some federal program funds not commonly recognized as education assistance are also included in the totals reported. For example, portions of federal funds paid to some states and counties as shared revenues resulting from the sale of timber and minerals from public lands have been estimated as funds used for education purposes. Parts of the funds received by states (in 1980) and localities under the General Revenue Sharing Program are also included, as are portions of federal funds received by the District of Columbia. The share of these funds allocated to education was assumed to be equal to the share of general funds expended for elementary and secondary education by states and localities in the same year as reported by the U.S. Bureau of the Census in its annual publication *Governmental Finances*.

All state intergovernmental expenditures for education were assumed to be earmarked for elementary/secondary education. Contributions of parent governments of dependent school systems to their public schools amounted to approximately 9 percent of local government revenues and local government revenue sharing in each year. Therefore, 9 percent of local government revenue-sharing funds were assumed allocated each fiscal year to elementary and secondary education. Parent government contributions to public school systems were obtained from the U.S. Bureau of the Census publication *Finances of Public School Systems*. The amount of state revenue-sharing funds allocated for postsecondary education in 1980 was assumed to be 13 percent, the proportion of direct state expenditures for institutions of higher education reported in *Governmental Finances* for that year.

The share of federal funds for the District of Columbia assigned to education was assumed to be equal to the share of the city's general fund expenditures for each level of education.

For the job training programs conducted by the Department of Labor, only estimated sums spent on classroom training have been reported as educational program support.

During the 1970s, the Office of Management and Budget (OMB) prepared annual reports on federal education program support. These were published in *Budget of the U.S. Government [Special Analyses]*. The information presented in this report is not, however, a continuation of the OMB series. A number of differences in the two series should be noted. OMB required all federal agencies to report outlays for education-related programs using a standardized form, thereby assuring agency compliance in reporting. The scope of education programs reported here differs from that of OMB. Off-budget items such as the annual volume of guaranteed student loans were not included in OMB's reports. Finally, while some mention is made of an annual estimate of federal tax expenditures, OMB did not include them in its annual analysis of federal education support. Estimated federal tax expenditures for education are the difference between current federal tax receipts and what these receipts would be without existing education deductions to income allowed by federal tax provisions.

Recipients' data are estimated based on *Estimating Federal Funds for Education: A New Approach Applied to Fiscal Year 1980*, U.S. Department of Education, "Federal Support for Education, Fiscal Years 1980 to 1984," and *Catalog of Federal Domestic Assistance*. The recipients' data tend to undercount institutions of higher education (IHEs), students, and local education agencies (LEAs). This is because some of the federal programs have more than one recipient receiving funds. In these cases the recipients were put into a "mixed recipients" category, because there was no way to disaggregate the amount each recipient received.

High School and Beyond

High School and Beyond (HS&B) is a national longitudinal study of 1980 high school sophomores and seniors. The base-year survey was a probability sample of 1,015 high schools, with a target number of 36 sophomores and 36 seniors in each of the schools. A total of 58,270 students participated in the base-year survey. Substitutions were made for noncooperating schools—but not for students—in those strata where it was possible. Overall, 1,122 schools were selected in the original sample and 811 of these schools participated in the survey. An additional 204 schools were drawn in a replacement sample. Student refusals and student absences resulted in an 82 percent completion rate for the survey.

Several small groups in the population were oversampled to allow for special study of certain types of schools and students. Students completed questionnaires and took a battery of cognitive tests. In addition, a sample of parents of sophomores and seniors (about 3,600 for each cohort) was surveyed.

HS&B first followup activities were conducted in the spring of 1982. The sample design of the first followup survey called for the selection of approximately 30,000 individuals who were sophomores in 1980. The completion rate for sophomores eligible for on-campus survey administration was about 96 percent. About 89 percent of the students who left school between the base-year and first followup surveys (dropouts, transfer students, and early graduates) completed the first followup sophomore questionnaire.

In designing the senior cohort first followup survey, one of the goals was to reduce the size of the retained sample, while still keeping sufficient numbers of minorities to allow important policy analyses. A total of 11,227 (94 percent) of the 11,995 persons subsampled completed the questionnaire. Information was obtained about the respondents' school and employment experiences, family status, and attitudes and plans.

The sample for the second followup, which took place in the spring of 1984, consisted of about 12,000 members of the senior cohort and about 15,000 members of the sophomore cohort. The completion rates were 91 and 92 percent, respectively.

HS&B third followup data collection activities were conducted in the spring of 1986. Both the sophomore and senior cohort samples for this round of data collection were the same as those used for the second followup survey. The completion rates for the sophomore and senior cohort samples were 91 percent and 88 percent, respectively.

High School Transcript Studies

As part of the first followup survey of High School and Beyond (HS&B), transcripts were requested in fall 1982 for an 18,152-member subsample of the sophomore cohort. Of the 15,941 transcripts actually obtained, 1,969 were excluded because the students had dropped out of school before graduation; 799 were excluded because they were incomplete; and 1,057 were excluded because the students graduated before 1982 or the transcript indicated neither a dropout status nor graduation. Thus, 12,116 transcripts were used for an overall curriculum analysis.

All courses in each transcript were assigned a six-digit code based on *A Classification of Secondary School Courses* (developed by Evaluation Technologies, under contract with NCES). Credits earned in each course were expressed in Carnegie units. (The Carnegie unit is a standard of measurement that represents 1 credit for the completion of a 1-year course. To receive credit for a course, the student must have received a passing grade—"pass," "D," or higher.) Students who transferred from public to private schools or from private to public schools between their sophomore and senior years were eliminated from public/private analyses.

Transcripts of 1987 high school graduates were compared to transcripts of 1982 graduates to describe changes in course-taking patterns across this 5-year period. The sample of schools for the 1987 High School Transcript Study consisted of a nationally representative sample of 497 secondary schools selected for the 1986 National Assessment of Educational Progress (NAEP) for students in grade 11 who were 17 years old, of which 433 schools participated. The 1987 study was restricted to students who were in grade 11 during school year 1985-86 equaling 27,732 graduates.

The 1990 High School Transcript Study was conducted using methodology and techniques nearly identical to those used in the 1987 study.

The analyses in the *Condition* focuses on high school graduates, so only those students who had graduated from high school were included from the 1990 study, the 1987 High School Transcript Study, and from HS&B.

Because the methods used to identify and define disabled students were different for the later studies, and in order to make the samples as comparable as possible, it was necessary to restrict the samples to those students whose records indicated they had not participated in a special education program.

In the spring of 1991, transcripts were collected from 21,607 students who graduated from high school in 1990. These students attended 330 schools that had previously been sampled for the NAEP.

Between May and November of 1994, high school transcripts were collected from 25,573 students who graduated from high school in 1994. To be consistent with the 1982 study, students with an Individualized Education Program (IEP) were omitted. Also, students with incomplete transcripts were dropped, bringing the number of transcripts analyzed to 24,374. These students attended 340 schools that had previously been sampled by NAEP.

Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys all postsecondary institutions, including universities and colleges, as well as institutions offering technical and vocational education beyond the high school level. This survey, which began in 1986, replaces and expands upon the Higher Education General Information Survey (HEGIS).

IPEDS consists of several integrated components that obtain information on where postsecondary education is available (institutions), who participates in it and completes it (students), which programs are offered and are completed, and which human and financial resources are involved in the provision of institutionally based postsecondary education. Specifically, these components include: fall enrollment in occupationally specific programs; salaries of full-time instructional faculty; completions (degrees awarded); finance; staff; institutional characteristics, including institutional activity; fall enrollment, including age and residence; and academic libraries.

The higher education portion of this survey is a census of accredited 2- and 4-year colleges. From 1986-92, data from private less-than-2-year institutions (primarily vocational/technical institutions) were collected through a sample survey. Thus, some portions of all postsecondary institutional data will be subject to sampling and nonsampling errors, while that portion from accredited 2- and 4-year colleges will be subject only to nonsampling error. In 1993, IPEDS began to survey the universe of all postsecondary institutions eligible for Title IV student financial aid.

Prior to the establishment of IPEDS in 1986, HEGIS acquired and maintained statistical data on the characteristics and operations of institutions of higher education. Implemented in 1966, HEGIS was an annual universe survey of institutions listed in the latest NCES *Education Directory of Colleges and Universities*.

The trend tables presented in this report draw on IPEDS and HEGIS surveys, which solicited information concerning institutional characteristics, faculty salaries, finances, enrollment, and degrees. Since these surveys were distributed to all higher education institutions, the data presented were not subject to sampling error. However, they were subject to nonsampling error, the sources of which varied with the survey instrument. Information concerning the nonsampling error of the enrollment and degrees surveys draws extensively on the "HEGIS Post-Survey Validation Study" conducted in 1979.

For additional information about IPEDS, contact:

Roslyn A. Korb
Postsecondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208-5652
Telephone: (202) 219-1587
e-mail: Roslyn_Korb@ed.gov

Fall Enrollment. This survey has been part of the IPEDS or HEGIS series since 1966. The enrollment survey response rate is relatively high; for example, the 1992 response rate was 86.9 percent.

Major sources of nonsampling error for this survey were classification problems, the unavailability of needed data, interpretation of definitions, the survey due date, and operational errors. Of these, the classification of students appears to have been the main source of error. Institutions had problems in correctly classifying first-time freshmen, other first-time students, and unclassified students for both full-time and part-time categories. These problems occurred most often at 2-year institutions (private and public) and private 4-year institutions. In the 1977-78 HEGIS validation studies, the classification problem led to an estimated overcount of 11,000 full-time students and an undercount of 19,000 part-time students. Although the ratio of error to the grand total was quite small (less than 1 percent), the percentage of errors was as high as 5 percent for detailed student levels and even higher at certain aggregation levels.

Beginning in fall 1986, the survey system was redesigned with the introduction of IPEDS (see above). The new survey system comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing HEGIS institutions to be tabulated separately. The new system also provides for preliminary and revised data releases. This allows NCES the flexibility to release early data sets while still maintaining a more accurate final database.

Salaries, Tenure, and Fringe Benefits of Full-time Instructional Faculty. This survey has been conducted for most years between 1966-67 and 1985-86, and in 1987-88 and 1989-90. Although the survey form was changed a number of times during those years, only comparable data are presented in this report. The data were collected from the individual colleges and universities.

Between 1966-67 and 1985-86 this survey differed from other HEGIS surveys in that imputations were not made for nonrespondents. Thus, there is some possibility that the salary averages presented in this report may differ from the results of a complete enumeration of all colleges and universities. Beginning with the surveys for 1987-88, the IPEDS data tabulation procedures included imputations for survey nonrespondents. The response rate

for the 1993–94 survey was 90.1 percent. The response rate for public colleges was substantially higher than the response rate for private colleges. Thus, it is probable that the public colleges' salary data are more accurate than the data for private colleges. Although data from these surveys are not subject to sampling error, sources of nonsampling error included computational errors and misclassification in reporting and processing. NCES checked individual colleges' data for internal and longitudinal consistency and contacted the colleges to check inconsistent data.

Completions. This survey was always part of the HEGIS series. However, the degree classification taxonomy was revised in 1970 and again in 1980, with additional revisions in 1985 and 1990. Collection of degree data has been maintained through the IPEDS system.

Though information from survey years 1970–71 through 1981–82 is directly comparable, care must be taken if information before or after that period is included in any comparison. For example, degrees-conferred trend tables arranged by the 1982–83 classification were added to the *Digest of Education Statistics, 1992* to provide consistent data from 1970–71 to 1988–89. However, data on associate's degrees and other formal awards below the baccalaureate, by field of study after 1982–83, are not comparable with figures for earlier years. The nonresponse rate did not appear to be a significant source of nonsampling error for this survey. The return rate over the years was high, with a response rate for the 1992–93 survey of 88.2 percent. Because of the high return rate, nonsampling error caused by imputation was also minimal.

The major sources of nonsampling error for this survey were differences between the NCES program taxonomy and taxonomies used by the colleges, classification of double majors and double degrees, operational problems, and survey timing. In the 1979 HEGIS validation study, these sources of nonsampling were found to contribute to an error rate of 0.3 percent overreporting of bachelor's degrees and 1.3 percent overreporting of master's degrees. The differences, however, varied greatly among fields. Over 50 percent of the fields selected for the validation study had no errors identified. Categories of fields that had large differences were business and management, education, engineering, letters, and psychology. It was also shown that differences in proportion to the published figures were less than 1 percent for most of the selected fields that had some errors. Exceptions to these were: master's and Ph.D. programs in labor and industrial relations (20 percent and 8 percent); bachelor's and master's programs in art education (3 percent and 4 percent); bachelor's and Ph.D. programs in business and commerce, and in distributive education (5 percent and 9 percent); master's programs in philosophy (8 percent); and Ph.D. programs in psychology (11 percent).

Financial Statistics. This survey was part of the HEGIS series and has been continued under the IPEDS system. Changes were made in the financial survey instruments in fiscal years (FY) 1976, 1982, and 1987. The FY 76 survey instrument contained numerous revisions to earlier survey forms and made direct comparisons of line items very difficult. Beginning in FY 82, Pell grant data were collected on federal restricted grants and contracts revenues and restricted scholarships and fellowships expenditures. The introduction of IPEDS in the FY 87 survey included several important changes to the survey instrument and data processing procedures. While these changes were significant, considerable effort has been made to present only comparable information on trends in this report and to note inconsistencies. Finance tables for this publication have been adjusted by subtracting the largely duplicative Pell Grant amounts from the later data to maintain comparability with pre-FY 82 data.

Possible sources of nonsampling error in the financial statistics include nonresponse, imputation, and misclassification. The response rate has been about 85–90 percent for most of the years reported. The response rate for the FY 1993 survey was 80.2 percent.

Two general methods of imputation were used in HEGIS. If the prior year's data were available for a nonresponding institution, these data were inflated using the Higher Education Price Index and adjusted according to changes in enrollments. If no previous year's data were available, current data were used from peer institutions selected for location (state or region), control, level, and enrollment size of institution. In most cases estimates for nonreporting institutions in IPEDS were made using data from peer institutions.

Beginning with FY 87, the new survey system (IPEDS, see above) has comprised all postsecondary institutions, but has also maintained comparability with earlier surveys by allowing 2- and 4-year HEGIS institutions to be tabulated separately. The finance data tabulated for this publication reflect totals for the HEGIS or higher education institutions only. For FY 87 through FY 89, in order to maintain comparability with the historical time series of HEGIS institutions, data were combined from two of the three different survey forms that make up the IPEDS survey system. The vast majority of the data were tabulated from Form 1, which was used to collect information from public and private nonprofit 2- and 4-year colleges. Form 2, a condensed form, was used to gather data for the 2-year proprietary institutions. Because of the differences in the data requested on the two forms, several assumptions were made about the Form 2 reports so that their figures could be included in the institutions of postsecondary education totals.

In IPEDS, the Form 2 institutions were not asked to separate appropriations from grants and contracts, nor state from local sources of funding. For the Form 2 institutions, all the federal revenues were assumed to be federal grants and contracts and all of the state and local revenues were assumed to be restricted state grants and contracts. All other Form 2 sources of revenue, except for tuition and fees and sales and services of educational activities, were included under "other." Similar adjustments were made to the expenditures accounts. The Form 2 institutions reported instruction, scholarship, and fellowship expenditures only. All other educational and general expenditures were allocated to academic support.

To reduce reporting error, NCES used national standards for reporting financial statistics. These standards are contained in *College and University Business Administration: Administrative Services* (1974 edition), published by

the National Association of College and University Business Officers; *Audits of Colleges and Universities* (as amended August 31, 1974), by the American Institute of Certified Public Accountants; and *HEGIS Financial Reporting Guide* (1980), by NCES. Wherever possible, definitions and formats in the survey form are consistent with those in these three accounting texts.

Fall Staff. The fall staff data presented in this publication were collected in cooperation with the U.S. Equal Employment Opportunity Commission (EEOC). In 1989, survey instruments were mailed to 6,669 in-scope postsecondary education institutions, including 2,576 4-year schools, 2,739 2-year schools, and 273 public less-than-2-year schools. The universe of 5,002 less-than-2-year private institutions were represented by a sample of 1,071 institutions.

EEOC collects staff data through the Higher Education Staff Information (EEO-6) report from all higher education institutions with 15 or more full-time employees. NCES, through the IPEDS system, collects data from all other postsecondary institutions, including higher education institutions with less than 15 full-time employees. NCES and EEOC collect staff data biennially in odd numbered years in institutions of postsecondary education. The IPEDS file combines data from the two surveys to create the IPEDS "Fall Staff" data tape. For example, the IPEDS "Fall Staff" questionnaires were mailed out in July 1989 by NCES; the respondents reported the number of employees in their institution as of October 1, 1989. The EEO-6 questionnaires were mailed out by EEOC between October and November 1989; the respondents reported the employment statistics in their institution that cover the payroll period closest to October 1 or the survey year.

The 3,589 institutions of higher education (in the 50 states and the District of Columbia) in operation in 1989 form a subset of the universe of postsecondary institutions in this report. These institutions are accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education; these institutions were previously surveyed under HEGIS, which IPEDS supersedes. The EEO-6 1991 "Fall Staff" survey had an overall response rate of 84.9 percent.

Institutional Characteristics. This survey provided the basis for the universe of institutions presented in the *Education Directory, Colleges and Universities*. The universe comprised institutions that met certain accreditation criteria and offered at least a 1-year program of college-level studies leading toward a degree. All of these institutions were certified as eligible by the U.S. Department of Education's Division of Eligibility and Agency Evaluation. Each fall, institutions listed in the previous year's *Directory* were asked to update a computer printout of their information.

International Assessment of Educational Progress

In 1990–91, a total of 20 countries assessed the mathematics and science achievement of 13-year-old students in the International Assessment of Educational Progress (IAEP), and 14 of the 20 countries assessed 9-year-old students. Some countries assessed virtually all age-eligible children in the appropriate age group; others confined their samples to certain geographic regions, language groups, or grade levels. The definition of populations often followed the structure of school systems, political divisions, and cultural distinctions. In some countries, significant proportions of age-eligible children were not represented because they did not attend school. Also, in some countries, low rates of school or student participation mean results may be biased. Typically, a random sample of 3,300 students from about 110 different schools was selected from each population at each age level; half were assessed in mathematics and half in science. A total of about 175,000 9- and 13-year-olds (those born in calendar years 1981 and 1977, respectively) were tested in 13 different languages in March 1991.

The achievement tests lasted 1 hour. The tests given to 9-year-olds included 62 questions in mathematics and 60 questions in science. Those for 13-year-olds included 76 questions in mathematics and 72 questions in science. In addition, students of each age group spent about 10 minutes responding to questions about their backgrounds and home and school experiences. School administrators completed a school questionnaire.

Initial analyses involved the calculation of the percentage of correct answers and standard errors for individual questions. For each population, the weighted percentage of correct answers was calculated for each question. The results of students who omitted questions at the end of sections because they did not reach them were excluded from the calculations for those questions. For each percentage correct, an estimate of its standard error was calculated using the jackknife procedure. Percentage and standard errors were calculated for subgroups within each population, including gender and grade. Statistics for Canada were calculated using an appropriately weighted sample of responses drawn from the individual Canadian populations.

National Adult Literacy Survey

The National Adult Literacy Survey (NALS) was created as a new measure of literacy and funded by the U.S. Department of Education and by 12 states. It is the third, and largest assessment, of adult literacy funded by the federal government. The aim of the survey is to profile the English literacy of adults in the United States based on their performance across a wide array of tasks that reflect the types of materials and demands they encounter in their daily lives.

To gather the information on adults' literacy skills, trained staff interviewed nearly 13,600 individuals age 16 and

older during the first 8 months of 1992. These participants had been randomly selected to represent the adult population in the country as a whole. In addition, some 1,100 inmates from 80 federal and state prisons were interviewed to gather information on the proficiencies of the prison population. In total, over 26,000 adults were surveyed.

Each survey participant was asked to spend approximately an hour responding to a series of diverse literacy tasks as well as questions about his or her demographic characteristics, educational background, reading practices, and other areas related to literacy. Proficiency estimates for these scales were based on responses to the assessment tasks and reflect varying degrees of skill in prose, document, and quantitative literacy.

National Assessment of Educational Progress

The National Assessment of Educational Progress (NAEP) is a congressionally mandated study funded by the Office of Educational Research and Improvement (OERI), U.S. Department of Education. The overall goal of the project is to determine the nation's progress in education. To accomplish this goal, a cross-sectional study was designed and initially implemented in 1969. Periodically, NAEP has gathered information about levels of educational achievement across the country. NAEP has surveyed the educational accomplishments of 9-, 13-, and 17-year-old students (and in recent years, students in grades 4, 8, and 12), and occasionally young adults, in 10 learning areas. Different learning areas were assessed annually and, as of 1980–81, biennially. Most areas have been periodically reassessed in order to measure possible changes in education achievement.

The reading, writing, mathematics, and science assessments presented in this publication were conducted by either the Education Commission of the States (1969–1983) or the Educational Testing Service (1983 to the present). NAEP in-school assessments were based on a deeply stratified three-stage sampling design to obtain a nationally representative sample by age and, beginning in 1983–84, by grade. The first stage of sampling entails defining and selecting primary sampling units (PSUs). For each grade level (4, 8, or 12), the second stage entails enumerating, stratifying, and randomly selecting schools, both public and private, within each PSU selected at the first stage. The third stage involves randomly selecting students within a school for participation in NAEP. Assessment exercises were administered to small groups of students by specially trained personnel.

Information from NAEP is subject to both nonsampling and sampling error. Two possible sources of nonsampling error are nonparticipation and faulty instrumentation. The effects of nonparticipation are in some ways reduced through oversampling, although this does not assess the bias of nonparticipants. Instrumentation nonsampling error includes whether the NAEP assessment instruments measure what is being taught and in turn what is being learned by the students, ambiguous items or instructions, and insufficient time limits.

National Education Longitudinal Study of 1988

The National Education Longitudinal Study of 1988 (NELS:88) is the third major longitudinal study sponsored by NCES. The two studies that preceded NELS:88, the National Longitudinal Study of the High School Class of 1972 (NLS-72) and HS&B surveyed high school seniors (and sophomores in HS&B) through high school, postsecondary education, and work and family formation experiences. Unlike its predecessors, NELS:88 began with a cohort of 8th-grade students.

NELS:88 is designed to provide trend data about critical transitions experienced by young people as they develop, attend school, and embark on their careers. It complements and strengthens state and local efforts by furnishing new information on how school policies, teacher practices, and family involvement affect student educational outcomes (i.e., academic achievement, persistence in school, and participation in postsecondary education). The base-year NELS:88 was a multifaceted study questionnaire with four cognitive tests, and questionnaires for students, teachers, parents, and the school.

Sampling was first conducted at the school level and then at the student level within schools. The data were drawn from a nationally representative sample of 1,000 schools (800 public schools and 200 private schools, including parochial institutions). Within the school sample, 26,000 8th-grade students were selected at random. The first and second followups revisited the same sample of students in 1990, 1992 and 1994, when the 1988 8th-graders were in the 10th and 12th grades and then 2 years after their scheduled high school graduation. A similar followup is being conducted in 1997.

National Household Education Survey

The National Household Education Survey (NHES) is the first major attempt by NCES to go beyond its traditional, school-based data collection to a household survey. Historically, NCES has collected data from teachers, students, and schools through school-based surveys and from administrative records data through surveys of school districts and state education agencies. NHES has the potential to address many issues in education that have not been addressed previously by NCES data collection activities.

NHES is designed as a mechanism for collecting detailed information on educational issues from a relatively large and targeted sample of households in a timely fashion. Data for the NHES are being collected through telephone interviews, a relatively new approach for gathering data related to education issues. NHES uses Random Digit Dialing (RDD) to select households and Computer Assisted Telephone Interviewing (CATI) to collect information from household members. The sample for the NHES is drawn from the non-institutionalized civilian population in households with a telephone in the 50 states and the District of Columbia.

During the spring of 1991, NCES fielded a full-scale NHES on early education. Approximately 60,000 households were screened to identify a sample of children aged 3-8. The parents of these children were interviewed in order to collect information about their children's educational activities and the role of the family in children's learning. The NHES:93 is a subsequent survey conducted in the spring of 1993. It addressed readiness for school and safety and discipline in school. The NHES:93 early childhood component focused on readiness for school in a broad sense and examined several relevant issues. The School Safety and Discipline component of the NHES:93 addressed a new topic for the NHES. It focused on four areas: school environment, school safety, school discipline policy, and alcohol/other drug used and education. In the NHES:95 survey, the Early Childhood Program Participation component provides information on infants', toddlers' and preschoolers' participation in a variety of early care and education settings, including both home-based and center-based arrangements. The survey component also includes data on kindergarten and primary school history and experiences.

In NHES, an adult education supplement was also fielded. Adult household members were sampled and questioned about their participation in adult education. The adult education component was, for the most part, adapted from the previous Current Population Survey (CPS) adult education supplements. However, unlike the CPS, NHES collects information on both adult education participants and nonparticipants. The NHES:91 survey identified and screened more than 60,000 households. During the survey, a knowledgeable adult was asked a series of questions to screen all household members for adult education participation in a sample of about 20,000 of these 60,000 households, resulting in interviews with approximately 9,800 adult education participants. In the NHES:95 survey, of the 23,969 adults sampled for the adult education component, 80 percent (19,722) completed the interview.

National Longitudinal Study of the High School Class of 1972

The National Longitudinal Study (NLS) of the High School Class of 1972 began with the collection of base-year survey data from a sample of about 19,000 high school seniors in the spring of 1972. Five more followup surveys of these students were conducted in 1973, 1974, 1976, 1979, and 1986. The NLS was designed to provide the education community with information on the transitions of young adults from high school through postsecondary education and the workplace.

The sample design for the NLS is a stratified, two-stage probability sample of students from all schools, public and private, in the 50 states and the District of Columbia, with a 12th-grade enrollment during the 1971-72 school year. During the first stage of sampling, about 1,070 schools were selected for participation in the base-year survey. As many as 18 students were selected at random from each of the sample schools. The sizes of the

school and student samples were increased during the first followup survey. Beginning with the first followup and continuing through the fourth followup, about 1,300 schools participated in the survey, and slightly under 23,500 students were sampled. The response rates for each of the different rounds of data collection have been 80 percent or higher.

Sample retention rates across the survey years have been quite high. For example, of the individuals responding to the base-year questionnaire, the percentages who responded to the first, second, third, and fourth followup questionnaires were about 94, 93, 89, and 83 percent, respectively.

National Postsecondary Student Aid Study

NCES conducted the National Postsecondary Student Aid Study (NPSAS) for the first time during the 1986-87 school year. This survey established the first comprehensive student financial aid database. Data were gathered from 1,074 postsecondary institutions and approximately 60,000 students and 14,000 parents. These data provided information on the cost of postsecondary education, the distribution of financial aid, the characteristics of both aided and nonaided students and their families, and the nature of aid packages.

In response to the continuing need for these data, NCES conducted the second and third cycle of NPSAS in the 1989-90 and 1992-93 school years.

The 1990 in-school sample involved approximately 70,000 students selected from registrar lists of enrollees at 1,200 postsecondary institutions. The 1993 sample was taken from 77,000 students at 1,000 postsecondary institutions. The sample included both aided and non-aided students. Student information such as field of study, education level, and attendance status (part time or full time) was obtained from registrar records. Types and amounts of financial aid and family financial characteristics were abstracted from school financial aid records. Also, approximately 16,000 parents of students were sampled in 1990 and 12,500 parents were sampled in 1993. Data on family composition and parent financial characteristics also was compiled. Students enrolled in postsecondary education for the first time in 1990 will serve as the base for the longitudinal component of NPSAS.

National Survey of Postsecondary Faculty

The National Survey of Postsecondary Faculty (NSOPF-88) was a comprehensive survey of higher education instructional faculty in the fall of 1987. It was the first such survey conducted since 1963, and it gathered information regarding the backgrounds, responsibilities, workloads, salaries, benefits, and attitudes of both full- and part-time instructional faculty in 2- and 4-year institutions under both public and private control. In addition, information was gathered from institutional and department-level respondents on such issues as faculty composition, new hires, departures and recruitment, retention, and tenure policies.

There were three major components of the study: a survey of institutional-level respondents at a stratified random sample of 480 U.S. colleges and universities; a survey of a stratified random sample of 3,029 eligible department chairpersons (or their equivalent) within the participating 4-year institutions; and a survey of a stratified random sample of 11,013 eligible faculty members within the participating institutions. Response rates for the three surveys were 88 percent, 80 percent, and 76 percent, respectively.

The universe of institutions from which the sample was selected was all accredited nonproprietary U.S. postsecondary institutions that grant a 2-year (associate's) or higher degree and whose accreditation at the higher education level is recognized by the U.S. Department of Education. This includes religious, medical, and other specialized postsecondary institutions as well as 2- and 4-year nonspecialized institutions. According to the 1987 IPEDS, this universe comprised 3,159 institutions. The universe does not include proprietary 2- and 4-year institutions or less-than-2-year postsecondary institutions.

The second cycle of NSOPF, conducted in 1992-93, was limited to surveys of faculty and institutions, but with a substantially expanded sample of 974 public and private nonproprietary higher education institutions and 31,354 faculty. Unlike NSOPF-88, which was limited to faculty whose regular assignment included instruction, the faculty universe for NSOPF-93 was expanded to include anyone who was designated as faculty, whether or not their responsibilities included instruction, and other (non faculty) personnel with instructional responsibilities. Under this definition, researchers and administrators and other institutional staff who hold faculty positions, but who do not teach, were included in the sample. The definition of the institution universe for NSOPF-93 was identical to the one used in NSOPF-88.

Projections of Education Statistics

Since 1964, NCES has published *Projections of Education Statistics*, a report that shows projections of key statistics for elementary and secondary schools and institutions of higher education. Data are included for enrollments, instructional staff, graduates, and earned degrees. *Projections* includes several alternative projection series and a methodology section describing the techniques and assumptions used to prepare them. Data in this edition of *The Condition of Education* reflect the intermediate projection series only.

Differences between the reported and projected values are, of course, almost inevitable. An evaluation of past projections revealed that, at the elementary and secondary level, projections of enrollment have been quite accurate: mean absolute percentage differences for enrollment projections from 1 to 5 years into the future were less than 1 percent, while those for teachers were less than 4 percent.

Since projections of time series are subject to errors both by the nature of statistics and the properties of projection methodologies, users are cautioned not to place too much confidence in the numerical values of the projections. Important but unforeseeable economic and social changes may lead to differences. Projections are to be considered as indicators of broad trends.

Recent College Graduates Study

NCES has conducted periodic surveys of individuals, about 1 year after graduation, to collect information on college outcomes. The Recent College Graduates (RCG) surveys have concentrated on those graduates entering the teaching profession. To obtain accurate results on this smaller subgroup, graduates who are newly qualified to teach have been oversampled in each of the surveys. The survey involves a two-stage sampling procedure. First, a sample of institutions awarding bachelor's and master's degrees is selected and stratified by percentage of education graduates, control, and type of institution. Second, for each of the selected institutions, a sample of degree recipients is chosen. The response rates on the recent college graduates survey have tended to be low because of the great difficulty in tracing the students after graduation. Much more of the nonresponse can be attributed to invalid mailing addresses than to refusals to participate. Despite their shortcomings, the data are presented in this report because they provide valuable information not available elsewhere about college outcomes. Users should be cautious about drawing conclusions based on data from small samples. It is also likely that the data are somewhat biased, since the more mobile students, such as graduate students, are the most difficult to track for the survey.

The 1976 survey of 1974-75 college graduates was the first and smallest in the series. The sample consisted of 209 schools, of which 200 (96 percent) responded. Of the 5,506 graduates in the sample, 4,350 responded, for a response rate of 79 percent.

The 1981 survey was larger, with 301 institutions and 15,852 graduates. Responses were obtained from 286 institutions, for an institutional response rate of 95 percent, and from 9,312 graduates (716 others were determined to be out of scope), for a response rate of 62 percent.

The 1985 survey requested data from 18,738 graduates from 404 colleges. Responses were obtained from 13,200 students, for a response rate of 74 percent (885 were out of scope). The response rate for the colleges was 98 percent.

The 1987 survey form was sent to 21,957 graduates. Responses were received from 16,878, for a response rate of 79.7 percent. The *1987 Transcript Study* collected transcripts for each student who was part of the 1987 sample.

The 1991 survey sampled 18,135 graduates and 400 institutions. The response rates were 95 percent for the institutions and 83 percent for the graduates.

Schools and Staffing Survey

The school work force and teacher supply and demand are fundamental features of America's public and private

school landscape. Yet, until recently, there was a lack of data on the characteristics of our children's teachers and administrators and their workplace conditions. The Schools and Staffing Survey (SASS) was designed to meet this need. This survey is a comprehensive public and private, elementary/secondary education database that combines and expands 12 separate surveys that NCES has conducted in the past. These included surveys of teacher demand and shortage; public and private schools; public and private school teachers; public administrators; students; public and private library/media centers; and public and private librarians. Schools were the primary sampling unit for SASS, and a sample of teachers was selected in each school; public school districts were included in the sample when one or more of their schools was selected. The 1990–91 SASS included approximately 12,800 schools (9,300 public and 3,500 private), 65,000 teachers (52,000 public and 13,000 private), and 5,600 public school districts. The 1993–94 SASS included approximately 11,352 schools (8,767 public and 2,585 private), 55,477 teachers (47,105 public and 8,372 private), 4,993 public school districts, 6,233 students (5,032 public and 1,201 private), 96,874 libraries (77,573 public and 19,301 private), 76,668 librarians (67,832 public and 8,836 private), and 11,841 administrators (9,098 public and 2,743 private). The survey was conducted by mail and telephone.

The SASS sample has been designed to support the following types of estimates and comparisons: national and state estimates for public schools, teachers and administrators; estimates for private schools, teachers and administrators at the national level and for selected orientation groupings; and national comparisons of elementary, secondary, and combined schools, teachers and administrators. SASS was first conducted in the 1987–88 school year. The next collection will be in 1998–99.

Another component of SASS is the Teacher Followup Survey (TFS). The survey consists of a subsample of SASS, and is implemented 1 year after each SASS. The survey identifies and collects data from various groups of teachers who were interviewed the previous year: 1) those individuals who remain in the teaching profession, including those who remain in the same school, as well as those who have moved; and 2) those individuals who have left the teaching profession. These data are used to provide information about teacher attrition and retention in the public and private schools and to project teacher demand during the 1990s.

Office for Civil Rights

U.S. Department of Education

Elementary and Secondary School Civil Rights Survey

The Office for Civil Rights (OCR) in the U.S. Department of Education conducts periodic surveys of elementary and secondary schools to obtain data on the characteristics of students enrolled in public schools throughout the nation. Racial/ethnic status, gender, limited English proficiency, and handicapping conditions are among the characteristics covered by recent surveys. Such information is required by OCR to fulfill its responsibilities under Title VI of the Civil Rights Act of 1964, Title IX of the Education Amendments of 1972, and section 504 of the Rehabilitation Act of 1973. The 1976 survey was a complete census of public school districts in the nation. The 1984, 1986, and 1988 surveys were based on samples. The universe, from which the districts were to be sampled, was defined to be all public schools in the nation (50 states and the District of Columbia). A universe file maintained by the National Center for Education Statistics from its Common Core of Data was used. The selection factors used in selecting the sample were 1) minimum percent coverage of a specific population variable, and 2) maximum percent standard deviation of a projection of a population variable from the sample to the universe total.

Stratification also included district size and state. The 1984, 1986, 1988, 1990, and 1992 surveys are subject to sampling and nonsampling errors.

Office of Special Education and Rehabilitative Services

U.S. Department of Education

Annual Report to Congress on the Implementation of the Individuals with Disabilities Education Act

The Individuals with Disabilities Education Act (IDEA), formerly the Education of the Handicapped Act (EHA), requires the Secretary of Education to annually transmit to Congress a report that describes our school systems progress in serving the nation's disabled children. The annual report contains information on such children served by the public schools under the provisions of Part B of the IDEA and on children served in state-operated programs (SOP) for the disabled under Chapter I of the Education Consolidation and Improvement Act (ECIA). Statistics on children who receive special education and related services in various settings and on school personnel who provide such services are reported in an annual submission of data to the Office of Special

Education and Rehabilitative Services (OSERS) by the 50 states, the District of Columbia, and the outlying areas. The child count information is based on the number of disabled children who receive special education and related services on December 1 of each year for IDEA and October 1 for Chapter I of ECIA/SOP.

Since each participant in programs for the handicapped is reported to OSERS, the data are not subject to sampling error. However, nonsampling error can occur from a variety of sources. Some states follow a noncategorical approach to the delivery of special education services but produce counts by handicapping condition only because EHA-B requires it. In those states that do categorize their handicapped students, definitions and labeling practices vary. In each case, even though states must use the federal definitions of the handicapping categories for reporting purposes, there is no way to judge the accuracy of these states' relabeling of their students for the federal count. Some states also have reported combined counts for some of the smaller categories of handicap.

These variations in labeling practices may help explain why there have been inconsistencies both year to year within a given state and from state to state in the ways in which students with more than one handicapping condition have been categorized. However, federal and state efforts to ensure that children are being classified and reported appropriately, and efforts to achieve greater consistency in classification and reporting among states help minimize these variations.

Bureau of the Census

U.S. Department of Commerce

Current Population Survey

Current estimates of school enrollment and social and economic characteristics of students are based on data collected in the Bureau of the Census' monthly household survey of about 60,000 households, known as the Current Population Survey (CPS). The CPS covers 729 sample areas consisting of 1,973 counties, independent cities, and minor civil divisions throughout the 50 states and the District of Columbia. Up to 1993, the sample was selected from 1980 census files and is periodically updated to reflect new housing construction. In 1994, the questionnaire for the CPS was redesigned, and the computer-assisted personal interviewing (CAPI) method was implemented. In addition, the 1990 census-based population controls with adjustments for the estimated population undercount were also introduced.

The primary function of the monthly CPS is to collect data on labor force participation of the civilian noninstitutional population. (It excludes military personnel and inmates of institutions.) In October of each year, questions on school enrollment by grade and other school characteristics are asked about each member of the household.

The estimation procedure employed for the monthly CPS data involves inflating weighted sample results to independent estimates for the total civilian noninstitutional population by age, sex, race, and Hispanic origin. These independent estimates are derived from statistics from decennial censuses of the population: statistics on births, deaths, and immigration and emigration; and statistics on the strength of the Armed Forces. Generalized standard error tables are provided in the *Current Population Reports*. The data are subject to both nonsampling and sampling errors.

For additional information refer to the *Current Population Reports*, Series P-20, or contact:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

School Enrollment. Each October, the CPS includes supplemental questions on the enrollment status of the population aged 3 and older. Annual reports documenting school enrollment of this population have been produced by the Bureau of the Census since 1946. The latest report is *Current Population Reports*, Series P-20, *School Enrollment—Social and Economic Characteristics of Students: October 1994*.

All sample surveys are subject to sampling and nonsampling error. The main sources of nonsampling error in the supplement are those inherent in any household survey. When a household respondent reports for all individuals in the household, is that person knowledgeable about the grade or level of school, type of school, or full-time status? In addition, some analysts believe social acceptability of response causes biased reporting, such as reluctance to report lack of a high school diploma; some dismiss it. Household-reported data may not be consistent with administrative data because definitions may not be the same. An additional source of variation in statistics reported may be a change in the survey universe over time. For example, a significantly larger proportion of young men were members of the Armed Forces in the late 1960s and early 1970s than before or after and, therefore, were not in the CPS universe. That caused a short-term increase in the school enrollment rate of young men, which was greater than the increase in numbers of enrollees would indicate. Other events may similarly affect survey data. The user must be mindful of external events as well as the character of the population being measured when describing survey trends.

An advantage of household survey data over administrative data is the availability of demographic, social, and

economic data for the student and family. Beginning with data for October 1994, tabulations have begun to be controlled to the 1990 census. Estimates for earlier years were controlled to earlier censuses.

For additional information about the CPS school enrollment data, contact:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

Educational Attainment. Data on years of school completed are derived from two questions on the CPS instrument. Biennial reports documenting educational attainment are produced by the Bureau of the Census using March CPS data. The latest report is *Current Population Reports, Series P-20, No. 476 Educational Attainment in the United States, March 1993 and 1992*.

The usual constraints on use of household survey data apply. Reliability of response may depend on whether a proxy respondent was used, the recency and importance of the event, and the number and clarity of response categories. There is some evidence that years of school completed in the CPS may not measure completion of degrees as clearly as they once did. The number of persons who have completed 4 years of college has been increasing more rapidly than the number of bachelor's degrees added each year would suggest. While the number of years completed is not deteriorating in quality (that is, respondents are not exaggerating the number of years), more students than in the past are taking more than 4 academic years to complete a bachelor's degree. Also, although interviewers are instructed to count receiving a high school diploma by means of passing a GED exam as completion of the 12th grade, as the number of persons who have received a diploma in this way has increased, the number counted appropriately may not have kept pace. The 1990 Census of Population contains a question on highest degree received rather than relying solely on a "years of school completed" item.

Beginning with the data for March 1994, tabulations are controlled to the 1990 census. Estimates for earlier years were controlled to earlier censuses.

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

Participation in Adult Education. In May of 1969, 1972, 1975, 1978, 1981, and 1984, the CPS included a supplemental inquiry on "Participation in Adult Education" (PAE). In addition to the questions on the CPS, interviewers asked if anyone in the household 17 years of age or older had participated in adult education in the 12-month period prior to the survey date. A survey form was filled out by the interviewer or left with a proxy member of the household for participants who were not at home at the time of the interview. In 1981, the supplement form was no longer left with the proxy but completed by the interviewer.

The PAE response rate of 94 percent in 1981 must be viewed in conjunction with the 96 percent response rate of the CPS. The overall response rate for the PAE survey in 1981 is then 90 percent.

For more information, contact:

Postsecondary Education Statistics Division
National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208-5652

Voting and Registration. In November of election years, the CPS includes supplemental questions on voting and registration within the civilian noninstitutional population. CPS voting estimates exceed counts of the actual number of votes cast. On balance, the CPS overstates voting in Presidential elections by 10-20 percent of the total number of persons reported as having voted.

Data on voter participation by social and economic characteristics of the population of voting age have been published since 1964 in *Current Population Reports, Series P-20*. The latest report is "Voting and Registration in the Election of November 1994."

How Workers Get Their Training

In January 1983 and 1991, The Employment and Training Administration (ETA) funded supplements to the Census Bureau's Current Population Survey on worker training. The questions asked individuals to identify various types of training they needed to obtain their current or last job as well as the training used to improve their skills on those jobs.

In contrast with the 1983 survey, interviewers conducting the 1991 survey were instructed to obtain the information from each individual directly; proxy responses were not permitted. Primarily because individuals could not answer by proxy, a high proportion of eligible persons in the sample did not respond to the January 1991 training questions. In order to obtain data about the population based only on information provided by respondents, the sample weight originally assigned each respondent was adjusted based on factors for specific age, sex, race, employment status, and occupational status. The adjusted weights were used to prepare published estimates.

The National Longitudinal Study of Youth

The National Longitudinal Study of Youth (NLSY) is a nationally representative sample of 12,686 young men and young women who were ages 14–21 in 1979 when they were first interviewed. Three independent probability samples, designed to represent the entire population of youth born in the United States between 1957 and 1964, were drawn for the NLSY: 1) a cross-sectional sample designed to be representative of the noninstitutionalized civilian segment of American young people aged 14–21 as of January 1, 1979; 2) a supplemental sample designed to overrepresent civilian Hispanic, black, and economically disadvantaged non-Hispanic, non-black youth; and 3) a military sample designed to represent the population aged 17–21 as of January 1, 1979 and serving in the military as of September 30, 1978.

Response rates within the NLSY sample have remained at or above 90 percent for the first 12 years of interviews. By the end of 1990, 10,436 civilian and military respondents continued to be interviewed for an overall retention rate of 89.9 percent.

Equal Employment Opportunity Commission

Higher Education Staff Information Survey (EEO-6)

The U.S. EEOC requires all public and private institutions of higher education with at least 15 full-time employees to file the Higher Education Staff Information (EEO-6) report biennially. Higher education institutions are those accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education.

The EEO-6 collects information on 1) the number of full-time and part-time employees, by occupation, race/ethnicity and sex; 2) the number of full-time faculty, by academic rank, tenure status, race/ethnicity, and sex; and 3) the salaries of full-time staff, by occupation, race/ethnicity, and sex.

Beginning in 1987, data from the EEO-6 have been combined with data collected by the NCES to create the Fall Staff survey. The Fall Staff survey is discussed under IPEDS and is conducted by NCES.

For additional information on the EEO-6 survey, contact:

Betty Wright
U.S. Equal Employment Opportunity
Commission
1801 L Street NW
Washington, DC 20507

Bureau of Justice Statistics

U.S. Department of Justice

National Crime Survey, School Crime Supplement

The National Crime Survey (NCS) conducted by the Bureau of Justice Statistics (BJS) collects data from a nationally representative sample of households. When a household is selected for inclusion in the sample, household members age 12 or older are interviewed every 6 months for 3 years. During each interview, information is obtained about the personal victimizations, if any, experienced by the interviewee in the 6 months preceding the interview. One member, generally over the age of 18, is also designated the household respondent, from whom information is obtained about all crimes committed against the household during the preceding 6 months.

The NCS measures both attempted and completed incidents of the violent crimes of rape, robbery, and aggravated and simple assault; personal thefts with and without contact; and the household crimes of burglary,

household larceny, and motor vehicle theft.

The School Crime Supplement to the NCS contains data collected in interviews conducted from January through June of 1989 as a supplement to the NCS data collection program. It focuses on personal crimes of violence and theft that were committed inside a school building or on school property only.

The only eligible respondents for this school crime supplement were those household members who were between the ages of 12 and 19, had attended school at any time during the 6 months preceding the interview, and were enrolled in a school that would advance them toward the eventual receipt of a high school diploma.

Washington, DC 20531

National Institute on Drug Abuse

U.S. Department of Health and Human Services

Monitoring the Future

The National Institute on Drug Abuse is the primary supporter of the long-term study entitled *Monitoring the Future: A Continuing Study of the Lifestyles and Values of Youth*, conducted by the University of Michigan, Institute for Social Research. One component of the study deals with student drug abuse, another investigates student victimization at school. Results of a national sample survey have been published annually since 1975.

Approximately 125 to 135 schools have participated each year. With the exception of 1975 when about 9,400 students participated in the survey, more than 15,000 students have participated annually. For the class of 1990, about 15,200 students responded to the survey. Over the years, the response rate has varied from 77 to 84 percent.

The data in this survey represent only high school seniors. Understandably, there will be some reluctance to admit illegal activities. Also, students who were out of school on the day of the survey were nonrespondents. The survey did not include high school dropouts. The inclusion of these two groups would tend to increase the proportion of individuals who had used drugs. A 1983 study found that the inclusion of the absentees could increase some of the drug usage estimates by as much as 2.7 percent. (Details on that study and its methodology were published in *Drug Use Among American High School Students, College Students, and Other Young Adults*, by Lloyd D. Johnston, Patrick M. O'Malley, and Jerald G. Bachman, available from the National Clearinghouse on Drug Abuse Information, 5600 Fishers Lane, Rockville, MD 20857.)

National Center for Health Statistics

U.S. Department of Health and Human Services

National Health Interview Survey

The National Health Interview Survey (NHIS) is a continuous cross-sectional household interview survey. Each week a probability sample of the civilian noninstitutionalized population of the United States is interviewed by personnel of the U.S. Bureau of the Census. Estimates for certain health characteristics, such as limited activity and respondent-assessed status, are compiled yearly. Information on special health topics, such as health care coverage, health promotion, and disease prevention, is periodically collected for all or a sample of household members.

All information collected in the survey results from reports by responsible family members or unrelated individuals residing in the household. When possible, all adult members participate in the interview. However, proxy responses are accepted for family members who are not at home, and are required for all children (those under 18 years of age) and for all household members who are physically or mentally incapable of responding for themselves.

In 1982, the NHIS questionnaire and data preparation procedures of the survey were extensively revised. The basic concepts of NHIS changed in some cases, and in other cases the concepts were measured in a different way. Comparisons with earlier results should not be undertaken without carefully examining these changes.

In 1985, although several new sample design features were adopted for NHIS, conceptually the sampling plan remained the same. The major changes included 1) reducing the number of primary sampling locations from 376 to 198 for sampling efficiency, 2) oversampling the black population to improve the precision of the statistics, 3) subdividing the NHIS sample into four separate representative panels to facilitate linkage to other National Center for Health Statistics (NCHS) surveys, and 4) using an all-area frame not based on the decennial census to facilitate NCHS survey linkage and to conduct NHIS followback surveys.

The National Center for Health Statistics provides estimates and technical notes on methods for this survey in Series 10 publications, *Data from the National Health Interview Survey*.

Hyattsville, MD 20782

National Science Foundation

Survey of Earned Doctorates

The Survey of Earned Doctorates (SED) has been conducted annually, under contract, by the National Research Council for the U.S. Department of Education, the National Endowment for the Humanities, the National Science Foundation, and other federal agencies since 1957. Information from the survey becomes part of the Doctorate Records File, which includes records for doctorates awarded since 1920 by regionally accredited universities and colleges. The universe consists of all recipients of doctoral degrees such as Ph.D. or D.Sc., but excludes the recipients of first-professional degrees such as the J.D. or M.D. Approximately 95 percent of the annual cohort of doctorate recipients have responded to the questionnaire, which is distributed through the cooperation of the Graduate Deans. Partial data from public sources are added to the file for nonrespondents. The data for a given year include all doctorates awarded in the 12-month period ending on June 30th of that year.

Data for the SED are collected directly from individual doctorate recipients. In addition to the field and specialty of the degree, the recipient is asked to provide educational history, selected demographic data, and information on postgraduate work and study plans. The National Center for Education Statistics' "Survey of Earned Degrees," part of its Integrated Postsecondary Education Data System, collected data from institutions, not individuals. Therefore, the number of doctorates reported in SED differs slightly from IPEDS/HEGIS totals. Also, SED data are restricted to research doctorates.

The differences between the two data series have been generally consistent since 1960. The ratio of IPEDS/HEGIS to SED totals for all Ph.D.s has ranged from 1.01 to 1.06.

Additional information on this survey can be obtained from Summary Report: *Doctorate Recipients from United States Universities*, various years, published by the National Research Council, or contact:

Office of Scientific and Engineering Personnel
National Research Council
2101 Constitution Avenue NW
Washington, DC 20418

Survey of Doctorate Recipients

The Survey of Doctorate Recipients (SDR) is a biennial survey of individuals who have received doctorates in the humanities, sciences, and engineering over the past four decades. It has surveyed scientists (including social scientists and psychologists) and engineers since 1973 and humanists since 1977. It is conducted by the National Research Council with support from the National Science Foundation, the National Endowment for the Humanities, the National Institutes of Health, the Department of Agriculture, and the Department of Energy.

The population for the survey consists of individuals who have received doctorates during a 42-year period. To maintain the length of this timespan for each biennial survey, the two most recent graduating cohorts of Ph.D.s are added to the population, and the two oldest are eliminated. It is a longitudinal—that is, individual members of the survey panel are resurveyed every 2 years—and contains historical data on employment status, employment sector, primary work activity, academic rank, tenure status, salary, and other characteristics.

For a more detailed discussion of the history of the SDR, the sample, and other methodological issues, see: National Research Council, *Methodological Report of the 1987 Survey of Doctorate Recipients*, National Research Council, April 1989 (prepared by Mary Belisle).

Washington, DC 20418

Scientific and Engineering Expenditures at Universities and Colleges Survey

The National Science Foundation's Scientific and Engineering Expenditures at Universities and Colleges Survey originated in 1954 and has been conducted annually since 1972. The population surveyed in most years has consisted of the 500-600 universities and colleges that grant a graduate science or engineering degree and/or annually perform at least \$50,000 in separately budgeted research and development (R&D). R&D is defined as current fund expenditures

designed to produce specific research outcomes and is funded either by an external agency to an institution or is separately budgeted by an internal institution unit. The institutions included in this survey population expend over 95 percent of the nation's academic R&D funds. In addition, approximately 17 university-administered, federally funded research and development centers (FFRDCs) that are engaged in basic or applied research, development, or management of R&D activities are surveyed.

Since 1984, this survey has been conducted as a sample survey consisting of two strata: a certainty stratum including all doctorate-granting institutions, all historically black colleges and universities with R&D, and all university-administered FFRDCs; and a probability stratum including a random sample of all nondoctorate-granting institutions that perform significant levels of research and development.

Additional information on this survey may be obtained from *Guide to the National Science Foundation's Surveys of Academic Science and Engineering*, December 1990, published by the National Science Foundation, or contact:

Science and Engineering Activities Program

1800 G Street NW, Room L-611

Washington, DC 20550

2. Other Organization Sources

American College Testing Program

The American College Testing (ACT) Assessment is designed to measure educational development in the areas of English, mathematics, social studies, and natural sciences. The ACT Assessment is taken by college bound high school students, and the test results are used to predict how well students might perform in college.

Prior to the 1984–85 school year, national norms were based on a 10 percent sample of the students taking the test. Since then, national norms have been based on the test scores of all students taking the test. Moreover, beginning with 1984–85, these norms have been based on the most recent ACT scores available from students scheduled to graduate in the spring of the year in which they take the test. Duplicate test records are no longer used to produce national figures.

ACT standard scores are reported for each subject area on a scale from 1 to 36. The four ACT standard scores have a mean (average) of about 19 and a standard deviation of about 6 for college-bound students nationally. A composite score is obtained by taking the simple average of the four standard scores and is an indication of student's overall academic development across these subject areas.

It should be noted that college-bound students who take the ACT Assessment are not representative in some respects of college-bound students nationally. First, students who live in the Midwest, Rocky Mountains and Plains, and the South are overrepresented among ACT-tested students compared with college-bound students nationally. Second, ACT-tested students tend to enroll in public colleges and universities more frequently than do college-bound students nationally.

The 1990 ACT assessment is significantly different from previous years. Consequently, it is not possible to make direct comparisons between scores earned in 1990 and scores earned in previous years. To permit continuity in the tracking of score trends, ACT has established links between scores earned on ACT tests administered before October 1989 and scores on the new ACT.

For additional information about the ACT Assessment, contact:

The American College Testing Program
2201 North Dodge Street
P.O. Box 168
Iowa City, IA 52243

American Federation of Teachers

The American Federation of Teachers (AFT) reports national and state average salaries and earnings of teachers, other school employees, government workers, and professional employees over the past 25 years. The AFT's survey of state departments of education obtains information on minimum salaries, experienced teachers reentering the classroom, and teacher age and experience. Most data from the survey are reported as received, although some data are confirmed by telephone. These data are available in the AFT's annual report *Survey and Analysis of Salary Trends*. While serving as the primary vehicle for reporting the results of the AFT's annual survey of state departments of education, several other data sources are also used in this report.

For additional information about this survey, contact:

American Federation of Teachers
555 New Jersey Avenue NW
Washington, DC 20001

College Entrance Examination Board

The Admissions Testing Program of the College Board comprises a number of college admissions tests, including the Preliminary Scholastic Assessment Test (PSAT) and the Scholastic Assessment Test (SAT). High school students participate in the testing program as sophomores, juniors, or seniors—some more than once during these 3 years. If they have taken the tests more than once, only the most recent scores are tabulated. The PSAT and SAT report subscores in the areas of mathematics and verbal ability.

The SAT results are not representative of high school students or college bound students nationally since the sample is self-selected. Generally, tests are taken by students who need the results to attend a particular college or university. The state totals are greatly affected by the requirements of its state colleges. Public colleges in a number of states require ACT scores rather than SAT scores. Thus, the proportion of students taking the SAT in these states is very low and is inappropriate for any comparison. In recent years, about 1 million high school students have taken the examination annually.

For additional information about the SAT, contact:

College Entrance Examination Board
Educational Testing Service
Princeton, NJ 08541

Gallup Poll

Each year the Gallup Poll conducts the "Public Attitudes Toward the Public Schools" survey, funded by Phi Delta Kappa. The survey includes interviews with approximately 1,600 adults representing the civilian noninstitutional population 18 years old and over.

The sample used in the 22nd annual survey was made up of a total of 1,594 respondents and is described as a modified probability sample of the nation. Personal, in-home interviewing was conducted in representative areas of the nation and types of communities. Approximately 67 percent of the respondents had no children in school, 30 percent were parents of children in public schools, and 6 percent had children attending nonpublic schools. This total is greater than 100 percent because some parents had children attending both public and nonpublic schools.

The survey is a sample survey and is subject to sampling error. The size of error depends largely on the number of respondents providing data. For example, an estimated percentage of about 10 percent based on the responses of 1,000 sample members has an approximate sampling error of 2 percent at the 95 percent confidence level. The sampling error for the difference in two percentages (50 percent versus 41 percent) based on two samples of 750 members and 400 members, respectively, is about 8 percent.

For additional information on this survey, contact:

Gallup Poll
Phi Delta Kappa
P.O. Box 789

Bloomington, IN 47402-0789

Graduate Record Examination Council

All students who have taken the Graduate Record Examinations (GRE) General Test were asked a series of background information questions. The responses and the test scores themselves form the basis for continuing GRE Program research. In addition, these data are compiled and included in an annual report. The 12th in the series is *A Summary of Data Collected From Graduate Record Examinations Test Takers During 1986- 1987*.

The GRE cautions users of these data that "information in these reports is based solely on examinees who took the GRE General Test and should not be interpreted as being representative of any other group. The report does not present data for all baccalaureate degree recipients, for all graduate school applicants, or for all first-time graduate school enrollees." Nevertheless, the test-taking group is a large subset (albeit a self-selected one) of each of these groups.

For additional information on this and previous editions of the report, contact:

Office of the GRE Program Director
Educational Testing Service
Princeton, NJ 08541

National Education Association

Estimates of School Statistics

The National Education Association (NEA) reports revenues and expenditure data in its annual publication, *Estimates of School Statistics*. Each year NEA prepares regression-based estimates of financial and other education statistics and submits them to the states for verification. Generally, about 30 states adjust these estimates based on their own data. These preliminary data are published by NEA along with revised data from previous years. States are asked to revise previously submitted data as final figures become available. The most recent publication contains all changes reported to the NEA. Some tables in *The Condition of Education* use revised estimates of financial data prepared by the NEA because it is the most current source. Since expenditure data reported to NCES must be certified for use in the U.S. Department of Education formula grant programs (such as Chapter I of the ECIA), NCES data are not available as soon as NEA estimates.

For additional information about this data, contact:

National Education Association—Research
1201 16th Street NW
Washington, DC 20036

United Nations Educational, Scientific, and Cultural Organization

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) conducts annual surveys of education statistics of its member countries. Besides official surveys, data are supplemented by information obtained by UNESCO through other publications and sources. Each year, more than 200 countries reply to the UNESCO surveys. In some cases, estimates are made by UNESCO for particular items such as world and continent totals. While great efforts are made to make them as comparable as possible, the data still reflect the vast differences among the countries of the world in the structure of education. While there is some agreement about the reporting of first- and second-level data, the third level (postsecondary education) presents numerous substantial problems. Some countries report only university enrollment while other countries report all postsecondary enrollment, including vocational and technical schools and correspondence programs. A very high proportion of some countries' third-level students attend institutions in other countries. While definition problems are many in this sort of study, other survey problems should not be overlooked. The member countries that provide data to UNESCO are responsible for their validity. Thus, data for particular countries are subject to nonsampling error and perhaps sampling error as well. Some countries may furnish only rough estimates, while data from other countries may be very accurate. Other difficulties are caused by the varying periodicity of data collection among the countries of the world. In spite of such problems, many researchers use UNESCO data because they are the best available. Users should examine footnotes carefully to recognize some of the data limitations.

The International Association for the Evaluation of Educational Achievement

IEA Reading Literacy Study

In the period 1989-92, the International Association for the Evaluation of Educational Achievement (IEA) conducted a Reading Literacy Study in 32 systems of education. The study focused on two levels in each of these systems: 1) the grade level where most 9-year-olds were to be found; and 2) the grade level where most 14-year-

olds were to be found.

To obtain comparable samples of students, multi-stage sampling was used in each country and schools or classes were typically drawn with a probability proportional to the size of the school or class.

Three major domains or types of reading literacy materials assessed at both age levels were as follows:

1. *Narrative prose*: Continuous texts in which the writers' aim is to tell a story—whether fact or fiction. They normally follow a linear time sequence and are usually intended to entertain or involve the reader emotionally. The selected extracts ranged from short fables to lengthy stories of more than 1,000 words.
2. *Expository prose*: Continuous texts designed to describe, explain, or otherwise convey factual information or opinion to the reader. The texts contained, for example, brief family letters and descriptions of animals as well as lengthy treatises on smoking and lasers.
3. *Documents*: Structured information presented in the form of charts, tables, maps, graphs, lists, or sets of instructions. These materials were organized in such a way that students had to search, locate, and process selected facts, rather than read every word of continuous text. In some cases, students were required to follow detailed instructions in responding to such documents.

To obtain raw scores, all correct answers were totaled for each student in each domain. The Rausch procedure was used to produce scales for each domain. Each scale was given a mean of 500 and a standard deviation of 100.

Additional information is available in the IEA, report *How in the World Do Students Read?* by Warwick B. Elley.

Organization for Economic Co-operation and Development

The Organization for Economic Co-operation and Development (OECD) publishes analyses of national policies in education, training, and economics in 23 countries. The countries surveyed include: Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom, United States, and Yugoslavia.

Since only developed nations, mostly European, are included in OECD studies, the range of analysis is limited. However, OECD data allow for some detailed international comparisons of financial resources or other education variables to be made for this selected group of countries.

Glossary

Academic support: (See Expenditures.)

Adult education: College, vocational, or occupational programs, continuing education or non-credit courses, correspondence courses and tutoring, as well as courses and other educational activities provided by employers, community groups, and other providers.

Advanced degree: Any formal degree attained after the bachelor's degree. Advanced degrees include master's degrees, doctoral degrees, and professional degrees.

Advantaged urban: Students in this group live in metropolitan statistical areas (MSAs) and attend schools where a high proportion of the students' parents are in professional or managerial positions. Schools were placed into this category on the basis of information about the type of community, the size of its population, and an occupational profile of residents provided by school principals participating in the National Assessment of Educational Progress (NAEP).

Appropriations (federal funds): Budget authority provided through the congressional appropriation process that permits federal agencies to incur obligations and to make payments.

Appropriations (institutional revenues): An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Associate's degree: A degree granted for the successful completion of a sub-baccalaureate program of studies, usually requiring at least 2 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Auxiliary enterprises: (See Revenues.)

Average daily attendance (ADA): The aggregate attendance of students in a school during a reporting period (normally a school year) divided by the number of days that school is in session during this period. Only days on which the students are under the guidance and direction of teachers should be considered days in session.

Average daily membership (ADM): The aggregate membership of a school during a reporting period (normally a school year) divided by the number of days that school is in session during this period. Only days on which the students are under the guidance and direction of teachers should be considered days in session. The average daily membership for groups of schools having varying lengths of terms is the average of the average daily memberships obtained for the individual schools.

Baccalaureate degree: (See Bachelor's degree.)

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Carnegie unit: A standard of measurement used for secondary education that represents the completion of a course that meets one period per day for 1 year.

Catholic school: (See Orientation.)

Cohort: A group of individuals who have a statistical factor in common, for example, year of birth.

Certificate: An award granted for the successful completion of a sub-baccalaureate program of studies, usually requiring less than 2 years of full-time postsecondary study.

College: A postsecondary school that offers general or liberal arts education, usually leading to an associate's, bachelor's, master's, doctor's, or first-professional degree. Junior colleges and community colleges are included under this terminology.

Combined elementary and secondary school: A school that encompasses instruction at both the elementary and secondary levels. Examples of combined elementary and secondary school grade spans would be grades 1–12 or grades 5–12.

Computer and information sciences: A group of instructional programs that describes computer and information sciences, including computer

programming, data processing, and information systems.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer price index (CPI): This price index measures the average change in the cost of a fixed-market basket of goods and services purchased by consumers.

Control of institutions: A classification of institutions of elementary/secondary or higher education by whether the institution is operated by publicly elected or appointed officials (public control) or by privately elected or appointed officials and derives its major source of funds from private sources (private control).

Core subjects: *A Nation at Risk* recommended that all students seeking a high school diploma be required to enroll in a core curriculum called "New Basics." The core subjects included in this plan are 4 units of English, 3 units each of science, social studies, and mathematics, and 0.5 units of computer science.

Cost of college attendance: Cost of living for students attending postsecondary institutions, including tuition and fees, books, room and board, child care, transportation, and other miscellaneous expenses.

Current dollars: Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures per pupil in enrollment: (See Expenditures.)

Current-fund expenditures: (See Expenditures.)

Current-fund revenues: (See Revenues.)

Dependent student: A student who under federal criteria is considered to be financially dependent on his or her parents or guardians. Most full-time students are considered dependent until they are 24 years old.

Disadvantaged urban: Students in this group live in metropolitan statistical areas (MSAs) and attend schools where a high proportion of the students' parents are on welfare or are not regularly employed. Schools were placed into this category on the basis of information about

the type of community, the size of its population, and an occupational profile of residents provided by school principals participating in NAEP.

Doctor's degree: An earned degree carrying the title of Doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.), musical arts (D.M.A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading. (See First-professional degree.)

Dropout: The term is used both to describe the event of leaving school before graduating and the status of an individual who is not in school and who is not a graduate. Transferring schools, for example, from a public to a private school, is not regarded as a dropout event. A person who drops out of school may later return and graduate. At the time the person left school initially, he or she is called a *dropout*. At the time the person returns to school, he or she is called a *stopout*. Measures to describe these often complicated behaviors include the event dropout rate (or the closely related school persistence rate), the status dropout rate, and the high school completion rate.

Educational and general expenditures: (See Expenditures.)

Educational attainment: The highest grade of regular school attended and completed.

Elementary school: A school classified as elementary by state and local practice and composed of any span of grades not above grade 8. Preschool or kindergarten is included under this heading only if it is an integral part of an elementary school or a regularly established school system.

Elementary/secondary school: As reported in this publication, includes only regular schools (i.e., schools that are part of state and local school systems, and also most not-for-profit private

elementary/secondary schools, both religiously affiliated and nonsectarian). Schools not reported include subcollegiate departments of institutions of higher education, residential schools for exceptional children, federal schools for American Indians, and federal schools on military posts and other federal installations.

Employed: Includes civilian, non-institutionalized persons who 1) worked during any part of the survey week as paid employees; worked in their own businesses, professions, or farms; or worked 15 hours or more as unpaid workers in a family-owned enterprise; or 2) who were not working but had jobs or businesses from which they were temporarily absent due to illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were seeking another job.

Engineering and engineering technologies: Instructional programs that describe the mathematical and natural science knowledge gained by study, experience, and practice and applied with judgment to develop ways to economically use the materials and forces of nature for the benefit of humanity. Includes programs that prepare individuals to support and assist engineers and similar professionals.

English: A group of instructional programs that describes the English language arts, including composition, creative writing, and the study of literature.

Enrollment: The total number of students registered in a given school unit at a given time, generally in the fall of a year.

Expected family contribution (EFC): The amount that a family is expected to pay toward meeting costs of postsecondary attendance (both students and parents of dependent students are expected to make contributions). This amount is determined through an analysis of need (i.e., the Congressional Methodology) and is based on taxable and nontaxable income and assets as well as family size, the number of family members attending postsecondary institutions, extraordinary medical expenses, and so forth. For dependent students, the EFC consists of both a parental contribution and a separately calculated student contribution. The minimum

student contribution in 1988–89 was \$700 for freshmen and \$900 for other undergraduates.

Expenditures: Charges incurred, whether paid or unpaid, which are presumed to benefit the current fiscal year. For elementary/secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For

government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, extension of credit, or as agency transaction. Also, government expenditures include only external transactions, such as the provision of prerequisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions among the governments.

Academic support: This category of college expenditures includes expenditures for support services that are an integral part of the institution's primary missions of instruction, research, or public service. Includes expenditures for libraries, galleries, audio/visual services, academic computing support, ancillary support, academic administration, personnel development, and course and curriculum development.

Current expenditures (elementary/secondary): The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs. Beginning in 1980–81, expenditures for state administration are excluded.

Current expenditures per pupil in enrollment: Current expenditures for the regular school term divided by the total number of students registered in a given school unit at a given time, generally in the fall of a year.

Current-fund expenditures (higher education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships, fellowships, auxiliary enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Educational and general expenditures: The sum of current-fund expenditures on instruction, research, public service, academic support, student services, institutional

support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Instruction: This category includes expenditures of the colleges, schools, departments, and other instructional divisions of higher education institutions, and expenditures for departmental research and public service, which are not separately budgeted. Includes expenditures for both credit and non-credit activities. Excludes expenditures for academic administration where the primary function is administration (e.g., academic deans).

Scholarships and fellowships: This category of college expenditures applies only to money given in the form of outright grants and trainee stipends to individuals enrolled in formal course work, either for credit or not. Aid to students in the form of tuition or fee remissions is included. College work-study funds are excluded and are reported under the program in which the student is working. In the tabulations in this volume, Pell grants are not included in this expenditure category.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit of measure, such as enrollment, average daily attendance, or average daily membership.

Family income: The combined income of all family members 14 years old and older living in the household for the period of 1 year. Income includes money income from jobs; net income from business, farm, or rent; pensions; dividends; interest; social security payments; and any other money income.

Federal aid: Student financial aid whose source is the federal government. This aid can either be provided by or administered by a federal agency. Federal agencies providing aid include the Department of Education, Department of Health and Human Services, Department of Defense, Veterans Administration, and the National Science Foundation. Federal aid can be in the form of grants, loans, and work-study aid.

Federal funds: Amounts collected and used by the federal government for the general purposes

of the government. There are four types of federal fund accounts: the general fund, special funds, public enterprise funds, and intragovernmental funds. The major federal fund is the general fund, which is derived from general taxes and borrowing. Federal funds also include certain earmarked collections, such as those generated by and used to finance a continuing cycle of business-type operations.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is usually based on a program requiring at least 2 academic years of work prior to entrance and a total of at least 6 academic years of work to complete the degree program, including both prior-required college work and the professional program itself. By NCES definition, first-professional degrees are awarded in the fields of dentistry (D.D.S or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Pharm.), podiatric medicine (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (J.D.), and theological professions (M.Div. or M.H.L.).

First-time teachers: Individuals who are teaching full time in the nation's school system this year for the first time. These teachers include recent college graduates, former substitute teachers, or individuals who had other jobs besides teaching either inside or outside the field of education.

Fiscal year: The yearly accounting period for the federal government, which begins on October 1 and ends on the following September 30. The fiscal year is designated by the calendar year in which it ends; for example, fiscal year 1992 begins on October 1, 1991, and ends on September 30, 1992. (From fiscal year 1844 to fiscal year 1976 the fiscal year began on July 1 and ended on the following June 30.)

Foreign languages: A group of instructional programs that describes the structure and use of language that is common or indigenous to individuals of the same community or nation, the same geographical area, or the same cultural traditions. Programs cover such features as

sound, literature, syntax, phonology, semantics, sentences, prose, and verse, as well as the development of skills and attitudes used in communicating and evaluating thoughts and feelings through oral and written language.

Free lunch eligibles: The National School Lunch Program's assistance program for low income children. Families with school-aged children who fall below the poverty level and have no other significant assets are eligible to receive government assistance in the form of free or reduced-price school lunches.

Full-time enrollment: The number of students enrolled in higher education courses with a total credit load equal to at least 75 percent of the normal full-time course load.

Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to full-time enrollment.

Full-time instructional faculty: Those members of the instruction/research staff who are employed full-time as defined by the institution, including faculty with released time for research and faculty on sabbatical leave. Full-time counts exclude faculty who are employed to teach less than two semesters, three quarters, two trimesters, or two 4-month sessions; replacements for faculty on sabbatical leave or those on leave without pay; faculty for preclinical and clinical medicine; faculty who are donating their services; faculty who are members of military organizations and paid on a different pay scale from civilian employees; academic officers whose primary duties are administrative; and graduate students who assist in the instruction of courses.

Full-time worker: One who is employed for 35 or more hours per week, including paid leave for illness, vacation, and holidays. Hours may be reported either for a survey reference week, or for the previous calendar year, in which case they refer to the usual hours worked.

GED recipient: A person who has obtained certification of high school equivalency by

meeting state requirements and passing an approved exam, which is intended to provide an appraisal of the person's achievement or performance in the broad subject matter areas usually required for high school graduation. (See General Educational Development Test.)

General Educational Development (GED) Test:

A test administered by the American Council on Education as the basis for awarding a high school equivalency certification.

Geographic region: 1) The four regions used by the Bureau of Economic Analysis of the U.S. Department of Commerce, the National Assessment of Educational Progress, and the National Education Association (NEA) are as follows (note that the NEA designated the Central region as the Middle region in its classification):

<i>Northeast</i>	<i>Southeast</i>
Connecticut	Alabama
Delaware	Arkansas
District of Columbia	Florida
Maine	Georgia
Maryland	Kentucky
Massachusetts	Louisiana
New Hampshire	Mississippi
New Jersey	North Carolina
New York	South Carolina
Pennsylvania	Tennessee
Rhode Island	Virginia
Vermont	West Virginia
<i>Central (Middle)</i>	<i>West</i>
Illinois	Alaska
Indiana	Arizona
Iowa	California
Kansas	Colorado
Michigan	Hawaii
Minnesota	Idaho
Missouri	Montana
Nebraska	Nevada
North Dakota	New Mexico
Ohio	Oklahoma
South Dakota	Oregon
Wisconsin	Texas
	Utah
	Washington
	Wyoming

2) The regions used by the Bureau of the Census in Current Population Survey (CPS) tabulations are as follows:

<i>Northeast</i>	<i>Midwest</i>
(New England)	(East North Central)
Maine	Ohio
New Hampshire	Indiana
Vermont	Illinois
Massachusetts	Michigan
Rhode Island	Wisconsin
Connecticut	
(Middle Atlantic)	(West North Central)
New York	Minnesota
New Jersey	Iowa
Pennsylvania	Missouri
	North Dakota
	South Dakota
	Nebraska
	Kansas
<i>South</i>	<i>West</i>
(South Atlantic)	(Mountain)
Delaware	Montana
Maryland	Idaho
District of Columbia	Wyoming
Virginia	Colorado
West Virginia	New Mexico
North Carolina	Arizona
South Carolina	Utah
Georgia	Nevada
Florida	
(East South Central)	(Pacific)
Kentucky	Washington
Tennessee	Oregon
Alabama	California
Mississippi	Alaska
	Hawaii
(West South Central)	
Arkansas	
Louisiana	
Oklahoma	
Texas	

Government appropriation: An amount (other than a grant or contract) received from or made

available to an institution through an act of a legislative body.

Government grant or contract: Revenues from a government agency for a specific research project or other program.

Graduate: An individual who has received formal recognition for the successful completion of a prescribed program of studies.

Graduate Record Examination (GRE): Multiple-choice examinations administered by the Educational Testing Service (ETS) and taken by applicants who plan to attend certain graduate schools. Two generalized tests are offered, plus specialized tests in a variety of subject areas. Ordinarily, a student will take only the specialized test that applies to the intended field of study.

Grants: Also known as scholarships, these are funds for postsecondary education that do not have to be repaid.

Gross Domestic Product (GDP): Gross national product less net property income from abroad. Both gross national product and gross domestic product aggregate only the incomes of residents of a nation, corporate and individual, derived directly from the current production of goods and services. However, gross national product also includes net property from abroad. (See also Gross National Product.)

Gross National Product (GNP): A measure of the money value of the goods and services available to the nation from economic activity. GNP can be viewed in terms of expenditure categories, which include purchases of goods and services by consumers and government, gross private domestic investment, and net exports of goods and services. The goods and services included are largely those bought for final use (excluding illegal transactions) in the market economy. A number of inclusions, however, represent imputed values, the most important of which is rental value of owner-occupied housing. GNP, in this broad context, measures the output attributable to the factors of production, labor, and property supplied by U.S. residents.

Guidance counselor: (See Staff, elementary/secondary education.)

High school: A secondary school offering the final years of high school work necessary for graduation, usually including grades 10, 11, 12 (in a 6-3-3 plan) or grades 9, 10, 11, and 12 (in a 6-2-4 plan).

High school program: A program of studies designed to prepare students for their postsecondary education and occupation. Four types of programs are usually distinguished as academic, vocational, general, and personal use. An academic program is designed to prepare students for continued study at a college or university. A vocational program is designed to prepare students for employment in one or more semiskilled, skilled, or technical occupations. A general program is designed to provide students with the understanding and competence to function effectively in a free society, and usually represents a mixture of academic and vocational components. A personal use program provides a student with general skills in areas such as health, religion, and military science.

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate's, bachelor's, or higher degree.

Higher education institutions (general definition): Institutions providing education above the instructional level of the secondary schools, usually beginning with grade 13. Typically, these institutions include colleges, universities, graduate schools, professional schools, and other degree-granting institutions.

Higher education price index: A price index that measures average changes in the prices of goods and services purchased by colleges and universities through current-fund education and general expenditures (excluding expenditures for sponsored research and auxiliary enterprises).

Humanities: Instructional programs in the following fields: area and ethnic studies, foreign languages, letters, liberal/general studies, multi/interdisciplinary studies, philosophy and religion, theology, and the visual and performing arts.

Independent operations: A group of self-supporting activities under control of a college or university. For purposes of financial

surveys conducted by the National Center for Education Statistics, this category is composed principally of federally funded research and development centers (FFRDC).

Inflation: An upward movement in general price levels that results in a decline of purchasing power.

Institutional support: The category of higher education expenditures that includes day-to-day operational support for colleges, excluding expenditures for physical plant operations. Examples of institutional support include general administrative services, executive direction and planning, legal and fiscal operations, and community relations.

Instruction: (See Expenditures.)

Instructional staff: Full-time-equivalent number of positions, not the number of different individuals occupying the positions during the school year. In local schools, includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or in the improvement of the teaching-learning situation. Includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel, and other instructional staff. Excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

Labor force: Individuals employed as civilians, unemployed, or in the armed services during the survey week. The "civilian labor force" is composed of all civilians classified as employed or unemployed. (See Employed and Unemployed.)

Life sciences: Life sciences are instructional programs that describe the systematic study of living organisms. Life sciences include biology, biochemistry, biophysics, and zoology.

Limited-English-proficient: A concept developed to assist in identifying those language-minority students (children from language backgrounds other than English) who need language assistance services, in their own language or in English, in the schools. The Bilingual Education Act, reauthorized in 1988 (P.L. 100-297), describes a limited-English-proficient (LEP) student as one who

- 1) meets one or more of the following conditions:
 - a) a student who was born outside the United States or whose native language is not English;
 - b) a student who comes from an environment where a language other than English is dominant; or
 - c) a student who is an American Indian or Alaskan Native and comes from an environment where a language other than English has had a significant impact on his/her level of English language proficiency; and
- 2) has sufficient difficulty speaking, reading, writing, or understanding the English language to deny him or her the opportunity to learn successfully in English-only classrooms.

In practice, many ways of making this determination about an individual student are being used by school systems across the United States. These include various combinations of home language surveys, informal teacher determination, formal interviews, and a number of types of assessment tests for classification, placement, and monitoring of progress.

Literacy: See supplemental note to *Indicator 31*.

Loan: Borrowed money that must be repaid.

Local education agency (LEA): (See School district.)

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree, or M.A., and the Master of Science degree, or M.S., is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, and an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study

beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Mathematics: A group of instructional programs that describes the science of logical symbolic language and its applications.

Metropolitan population: The population residing in metropolitan statistical areas (MSAs). (See Metropolitan Statistical Area.)

Metropolitan Statistical Area (MSA): A large population nucleus and the nearby communities that have a high degree of economic and social integration with that nucleus. Each MSA consists of one or more entire counties (or county equivalents) that meet specified standards pertaining to population, commuting ties, and metropolitan character. In New England, towns and cities, rather than counties, are the basic units. MSAs are designated by the Office of Management and Budget. An MSA includes a city and, generally, its entire urban area and the remainder of the county or counties in which the urban area is located. An MSA also includes such additional outlying counties that meet specified criteria relating to metropolitan character and level of commuting of workers into the central city or counties. Specified criteria governing the definition of MSAs recognized before 1980 are published in *Standard Metropolitan Statistical Areas: 1975*, issued by the Office of Management and Budget. New MSAs were designated when 1980 counts showed that they met one or both of the following criteria:

- 1) Included a city with a population of at least 50,000 within their corporate limits; or
- 2) Included a Census Bureau-defined urbanized area (which must have a population of at least 50,000) and a total MSA population of at least 100,000 (or, in New England, 75,000).

Minority: Any racial/ethnic group that is non-white is considered minority. (See Racial/ethnic group.)

Modal grade: The modal grade is the year of school in which the largest proportion of students of a given age are enrolled. Enrolled persons are classified according to their relative progress in school, that is, whether the grade or year in which

they were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey.

A Nation at Risk: A report published by the U.S. Department of Education in 1983 highlighting deficiencies in knowledge of the nation's students and population as a whole in areas such as literacy, mathematics, geography, and basic science.

Natural sciences: A group of fields of study that includes the life sciences, physical sciences, and mathematics.

Nonmetropolitan residence group: The population residing outside metropolitan statistical areas. (See Metropolitan statistical area.)

Nonsupervisory instructional staff: Persons such as curriculum specialists, counselors, librarians, remedial specialists, and others possessing education certification but not responsible for day-to-day teaching of the same group of pupils.

Nursery school: (See Preprimary.)

Obligations: Amounts of orders placed, contracts awarded, services received, or similar legally binding commitments made by federal agencies during a given period that will require outlays during the same or some future period.

Orientation (private school): The group or groups, if any, with which a private elementary/secondary school is affiliated, or from which it derives subsidy or support. Such organizations include the following:

Catholic school: A private school over which a Roman Catholic church group exercises some control or provides some form of subsidy. Catholic schools for the most part include those operated or supported by: a parish, a group of parishes, a diocese, or a Catholic religious order.

Other religious school: A private school that is affiliated with an organized religion or denomination other than Roman Catholicism or that has a religious orientation other than Catholicism in its operation and curriculum.

Nonsectarian school: A private school whose curriculum and operation are independent of religious orientation and influence in all but incidental ways.

Other technical/professional fields: A group of occupationally oriented fields, other than business, computer science, education, and engineering, which includes agriculture and agricultural sciences, architecture, communications, communications technologies, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Outlays: The value of checks issued, interest accrued on the public debt, or other payments made, net of refunds and reimbursements.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load less than 75 percent of the normal full-time credit load.

Part-time worker: One who is employed for 1–34 hours a week, including paid leave for illness, vacation, and holidays. Hours may be reported either for a survey reference week, or for the previous calendar year, in which case they refer to the usual hours worked.

Part-year worker: One who was employed at least 1 week but fewer than 50 weeks during the previous calendar year, including paid leave for illness, vacation, or other reasons.

Percentile (score): A value on a scale of zero to 100 that indicates the percent of a distribution that is equal to or below it. A score in the 95th percentile is a score equal to or better than 95 percent of all other scores.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as “persons” are individuals (including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private non-insured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits and military pensions, but excludes transfers among persons.

Physical sciences: Physical sciences are instructional programs that describe inanimate objects, processes, or matter, energy, and associated phenomena. Physical sciences include astronomy, astrophysics, atmospheric sciences, chemistry, geology, physics, planetary science, and science technologies.

Postsecondary education: The provision of formal instructional programs with a curriculum designed primarily for students who have completed the requirements for a high school diploma or equivalent. This includes programs of an academic, vocational, and continuing professional education purpose, and excludes vocational and adult basic education programs.

Poverty level: Poverty status is based on reports of family income on the March Current Population Survey. Families or individuals with gross incomes below the poverty threshold are classified as below the poverty level. Poverty thresholds in 1992 ranged from \$7,143 for a person living alone to \$28,745 for a family of four or more.

Prekindergarten: (See Preprimary.)

Preprimary: Elementary education programs for children who are too young for first grade. The year before first grade is called kindergarten; the year(s) before kindergarten is called preschool, nursery school, or prekindergarten. Not included in prekindergarten is essentially custodial care provided in private homes. Prekindergarten programs may be provided in regular elementary schools (with kindergarten, first-grade and higher grade programs) or in preschools (with only prekindergarten programs.)

Private school or institution: A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government, which is usually not supported primarily by public funds, and is not operated by publicly elected or appointed officials.

Proprietary institution: An educational institution that is under private control but whose profits derive from revenues subject to taxation.

Purchasing power parity: A method of converting other countries' expenditures to U.S. dollars in order to compare expenditure rates.

Purchasing power parity indices are calculated by comparing the cost of a fixed-market basket of goods in each country.

Racial/ethnic group: Classification indicating general racial or ethnic heritage based on self-identification, as in data collected by the Bureau of the Census, or on observer identification, as in data collected by the Office for Civil Rights. These categories are in accordance with the Office of Management and Budget standard classification scheme presented below:

American Indian/ Alaskan Native: A person having origins in any of the original peoples of North America and maintaining cultural identification through tribal affiliation or community recognition.

Asian/ Pacific Islander: A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands. This area includes, for example, China, India, Japan, Korea, the Philippine Islands, and Samoa.

Black: A person having origins in any of the black racial groups in Africa. Normally excludes persons of Hispanic origin except for tabulations produced by the Bureau of the Census, which are noted accordingly.

Hispanic: A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

White: A person having origins in any of the original peoples of Europe, North Africa, or the Middle East. Normally excludes persons of Hispanic origin except for tabulations produced by the Bureau of the Census, which are noted accordingly.

Reentrants: Teachers who left the school system for a period of time, and have now returned to classroom teaching.

Remedial education: Instruction for a student lacking the reading, writing, or mathematics skills necessary to perform college-level work at the level required by the attended institution.

Revenues: All funds received from external sources, net of refunds, and correcting transactions. Non-cash transactions such as

receipt of services, commodities, or other receipts "in kind" are excluded as are funds received from the issuance of debt, liquidation of investments, and non-routine sale of property.

Auxiliary enterprises: This category includes those essentially self-supporting operations that exist to furnish a service to students, faculty, or staff, and that charge a fee that is directly related to, although not necessarily equal to, the cost of the service. Examples are residence halls, food services, college stores, and intercollegiate athletics.

Current-fund revenues (higher education): Money received during the current fiscal year from revenue that can be used to pay obligations currently due, and surpluses reappropriated for the current fiscal year.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

Salary workers: Any person who worked one or more days during the previous year and was paid on the basis of a yearly salary is considered a salary worker.

Scholarships and fellowships: (See Expenditures.)

Scholastic Assessment Test (SAT): An examination administered by the Educational Testing Service and used to predict the facility with which an individual will progress in learning college-level academic subjects.

School climate: The social system and culture of the school, including the organizational structure of the school and values and expectations within it.

School district: An education agency at the local level that exists primarily to operate public schools or to contract for public school services. Synonyms are "local basic administrative unit" and "local education agency."

School year: The 12-month period of time denoting the beginning and ending dates for school accounting purposes, usually from July 1 through June 30.

Science: The body of related courses concerned with knowledge of the physical and biological world and with the processes of discovering and validating this knowledge.

Secondary school: A school that has any span of grades beginning with the next grade following an elementary or middle-school (usually grade 7, 8, or 9) and ending with or below grade 12. Both junior high schools and senior high schools are included.

Social and behavioral sciences: A group of scientific fields of study that includes anthropology, archeology, criminology, demography, economics, geography, history,

international relations, psychology, sociology, and urban studies.

Social studies: A group of instructional programs that describes the substantive portions of behavior, past and present activities, interactions, and organizations of people associated together for religious, benevolent, cultural, scientific, political, patriotic, or other purposes.

Socioeconomic status (SES): The SES quartile variable used for both High School and Beyond and the National Education Longitudinal Study of 1988 was built using parental education level, parental occupation, family income, and household items. Students were placed in quartiles based on their standardized composite score. By definition, one quarter of each cohort will reside in the bottom SES quartile, even if education levels, income, and the number of persons in more prestigious occupations increase. The terms high, middle, and low SES refer to the upper, middle two, and lower quartiles of the weighted SES composite index distribution.

Staff assignments, elementary and secondary school:

District administrative support staff: Personnel who are assigned to the staffs of the district administrators. They may be clerks, computer programmers, and others concerned with the functioning of the entire district.

District administrators: The chief executive officers of education agencies (such as

superintendents and deputies) and all others with district-wide responsibility. Such positions may be business managers, administrative assistants, coordinators, and the like.

Guidance counselors: Professional staff whose activities involve counseling students and parents, consulting with other staff members on learning problems, evaluating the abilities of students, assisting students in personal and social development, providing referral assistance, and working with other staff members in planning and conducting guidance programs for students.

Instructional (teacher) aides: Those staff members assigned to assist a teacher with routine activities associated with teaching (i.e., those activities requiring minor decisions regarding students, such as monitoring, conducting rote exercises, operating equipment, and clerking). Volunteer aides are not included in this category.

Librarians: Staff members assigned to perform professional library service activities such as selecting, acquiring, preparing, cataloging, and circulating books and other printed materials; planning the use of the library by students, teachers, and other members of the instructional staff; and guiding individuals in their use of library books and materials that are maintained separately or as part of an instructional materials center.

Other support services staff: All staff not reported in other categories. This group includes media personnel, social workers, data processors, health maintenance workers, bus drivers, security, cafeteria workers, and other staff.

School administrators: Those staff members whose activities are concerned with directing and managing the operation of a particular school. They may be principals or assistant principals, including those who coordinate school instructional activities with those of the local education agency (LEA) and other appropriate units.

Stopout: (See Dropout.)

Tax expenditures: Losses of tax revenue attributable to provisions of the federal income tax laws that allow a special exclusion, exemption, or deduction from gross income or provide a special credit, preferential rate of tax, or a deferral of tax liability affecting individual or corporate income tax liabilities.

Technical/professional fields: A group of occupationally oriented fields of study, other than engineering and computer science, that includes agriculture and agricultural sciences, architecture, business and management, communications, education, health sciences, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Total expenditure per pupil in average daily attendance: Includes all expenditures allocable to per pupil costs divided by average daily attendance. These allocable expenditures include current expenditures for regular school programs, interest on school debt, and capital outlay. Beginning in 1980–81, expenditures for state administration are excluded and expenditures for other programs (summer schools, community colleges, and private schools) are included.

Tuition and fees: A payment or charge for instruction or compensation for services, privileges, or the use of equipment, books, or other goods.

Type of higher education institutions:

4-year institution: An institution legally authorized to offer and offering at least a 4-year program of college-level studies wholly or principally creditable toward a baccalaureate degree. In some tables a further division between universities and other 4-year institutions is made. A "university" is a postsecondary institution that typically comprises one or more graduate professional schools. (See also University.)

2-year institution: An institution legally authorized to offer and offering at least a 2-year program of college-level studies that terminates in an associate's degree or is principally creditable toward a baccalaureate degree.

Undergraduate students: Students registered at an institution of higher education in a program leading to a baccalaureate degree or other formal award below the baccalaureate such as an associate's degree.

Unemployed: Civilians who had no employment but were available for work and 1) had engaged in any specific job-seeking activity within the past 4 weeks, 2) were waiting to be called back to a job from which they had been laid off, or 3) were waiting to report to a new wage or salary job within 30 days.

University: An institution of higher education that consists of a liberal arts college, a diverse graduate program, and usually two or more professional schools or faculties, and is empowered to confer degrees in various fields of study.

Urbanicity:

- 1) In the Schools and Staffing Survey, school location is categorized based on the classification in both the Common Core of Data (CCD) and the Quality Education data (QED), as drawn from U.S. Census data and definition. The results are summarized in three variables:

Central city: central city of an MSA (Metropolitan Statistical Area).

Urban fringe/large town: area surrounding a central city but within a county constituting an MSA.

Rural/small town: outside an MSA.

- 2) In the High School and Beyond Survey, urbanicity is classified based on the Curriculum Information Center code as follows:

Urban: within a central city of an MSA.

Suburban: within an MSA but outside the central city area.

Rural: outside a designated MSA.

Vocational education: Organized educational programs, services, and activities that are directly related to the preparation of individuals for paid or unpaid employment, or for additional preparation for a career, requiring other than a baccalaureate or advanced degree.

Work-study: A generic term for programs designed to provide part-time employment as a

source of funds to pay for postsecondary education as well as a federal program that is administered through postsecondary institutions.

Year-round worker: One who was employed at least 50 weeks during the previous calendar year, including paid leave for illness, vacation or other reasons.

Index

Following each entry is the related indicator numbers (e.g., 29, 30), supplemental table numbers (e.g., 29-1), and, when not available in the current edition, the volume number, indicator number, and year in brackets when last published (e.g., 2:14 [1991]). Beginning in 1992, *The Condition of Education* was published as a single volume; references to the 1992 and following editions contain only the indicator number and the year in brackets (e.g., 26 [1992]). Indicators that are new to *The Condition of Education 1996* are referenced using an italicized typeface (e.g., *Community service performed by high school seniors*).

 Graduate students
 by attendance status, 46 [1992]
 contact with faculty, 51 [1993]

H

Handicapped students (See Disabled students.)
 Health-related behavior of adults
 by age, 36 [1994]
 by income, 35 [1993]
 by race/ethnicity, 36 [1994]
 by sex, 36 [1994]
 by year and level of education, 36 [1994]
 Health sciences (field of study)
 education and certification of secondary teachers,
 57, 57-1, 57-2, 57-3, 57-4, 57-5
 college graduates
 employed, 31
 unemployed, 31-1
 degrees earned
 bachelor's degrees, 41, 41-1, 41-2, 41-3, 41-4
 doctor's degrees, 27 [1995]

 master's degrees, 27 [1995]
 graduate field of study, by sex, 27 [1995]
 Scholastic Assessment Test (SAT) scores, 22-6
 High school completion rate, 40, 40-1
 employment status, 33, 33-1, 33-2, 33-3
 High school enrollment rate, 38, 38-1, 38-2, 38-3
 High school graduates
 by age, 21 [1994]
 by race/ethnicity, 25, 25-1, 25-2, 25-3
 by sex, 25-1, 25-2, 25-3
 course units earned, 25 [1995]
 education and labor market outcomes, 34 [1993]
 enrolled in college the October following
 graduation, 7, 7-1, 7-2, 7-3, 7-4
 foreign language course units earned
 by race/ethnicity, 26 [1994]
 by sex, 26 [1994]
 high school graduates who projected an
 attainment of bachelor's degree or higher,
 26 [1994]
 mathematics and science course taking
 by geographic region, 29-5
 by sex, 29, 29-1
 by race/ethnicity, 29-2
 by school program, 29-6
 by control of school, 29-3
 by urbanicity, 29-4
 transition from high school to work
 by family income, 30-2
 by parents' highest level of education, 30-3
 by race/ethnicity, 30
 by sex, 30-1
 U.S. history proficiency (NAEP), 18-5
 High school persistence rates, 6 [1995]
 High school students
 drug use among high school seniors, 48 [1995]
 not prepared for class, 44 [1994]
 whose parents reported that school personnel
 contacted them, 44 [1995]
 working while attending school, 51 [1995]
 Hispanic (See Race/ethnicity.)
 History (field of study)
 college graduates
 employed, 31
 unemployed, 31-1
 courses taken in college, 28 [1994]
 proficiency (NAEP), 18, 18-1, 18-2, 18-3, 18-4, 18-5
 Scholastic Assessment Test (SAT) scores, 22-6
 students taking the GRE subject tests, 21 [1995]
 undergraduate courses taken by teachers, 60 [1993]
 Home economics (field of study)
 Scholastic Assessment Test (SAT) scores, 22-6
 Homework, time spent on
 by age, 46 [1993]
 by sex, 46 [1993]

came to school without homework completed, 44 [1994]
 international comparisons, 46 [1993]
 public versus private school students, 46 [1993]
 trends in reading scores, by amount of time spent on homework, 12 [1994]
U.S. history proficiency (NAEP), 18-3
 Humanities (field of study)
 education and certification of secondary teachers, 57, 57-1, 57-2, 57-3, 57-4, 57-5
 college graduates
 employed, 31
 salaries, 35, 35-1, 35-2
 unemployed, 31-1
 courses taken in college, 28 [1994]
 degrees earned
 bachelor's degrees
 by field of study, 41, 41-1, 41-2, 41-3, 41-4
 time to complete, 11-1
 doctorate degrees
 by sex and time to complete, 11 [1995]
 graduate degrees
 by American students, 42 [1993]
 by foreign students, 42 [1993]
 by race/ethnicity, 30 [1994]
 by sex, 27 [1992]
 faculty
 salaries, 60, 60-2
 workload at higher education institutions, 49-1, 49-2
 graduate field of study, by sex, 27 [1995]
 new doctorates with job commitments in higher education, 34 [1995]
 undergraduate courses taken by teachers, 60 [1993]
